250—HEAD OF DAIRY COWS AND HEIFERS—250

WORK HORSES YOUNG MULES

On the McNeil Dairy Ranch, 4 Miles West and 3 Miles South of

FRESNO

on North and Cornelia Avenues

FRIDAY, MAY 16 at 9 A. M.

Herd includes 200 choice dairy cows, Holsteins, Jerseys and Durhams, many with first and second calf, a large number fresh and some extra good springers.

50 HEAD OF CHOICE HEIFERS selected from the best cows in the herd and sired by pure bred, registered Holstein bulls. This will be an exceptional opportunity for dairymen to purchase some extra good dairy stock owing to the fact that this is a large herd, carefully culled and owner has instructed us to dispose of the entire herd.

POSITIVELY WITHOUT LIMIT OR RESERVE

TERMS: $100 and under cash, over $100, one-third cash, balance in 30, 60 and 90 days with bankable note.

A. McNeil, Owner

COL. BEN A. RHOADES,
HAROLD B. RHOADES,

1501-3-5 S. Main St., Los Angeles, Cal.

AUCTIONEERS.

The West's Greatest Sale of

REGISTERED JERSEYS

State Fair Grounds

Sacramento, California
Tuesday, May 27, 1919

Complete dispersal to the highest bidder of the famous herd owned by Clifford F. Reid, Portland, Oregon; the greatest herd of proven producing and show winning Jerseys ever sold at public auction in the West.

THE WORLD'S RECORD COW, GOLDIE'S NEHALEM BEAUTY

is in this sale, and she is the highest record Jersey cow ever offered at public auction in the world. With her will be her dam, two sisters, one daughter, two sons, fourteen granddaughters, and six grandsons.

IMPORTED COWS—REGISTER OF MERIT COWS

There will also be a choice selection of Register of Merit Cows and Heifers in the sale, some of the cows imported, and remember that this herd has won more prizes in the show ring during recent years than any other herd on the Coast.

Write for catalog now. It is free.

Management

CALIFORNIA BREEDERS' SALES AND PEDIGREE COMPANY

112-118 S. Los Angeles St. Los Angeles.

12-24 Nilson Tractor Practically New with P. & O. three bottom tractor plow; a real bargain. Jas. W. Parks, Colton, Washington.

HOME WATER SUPPLY

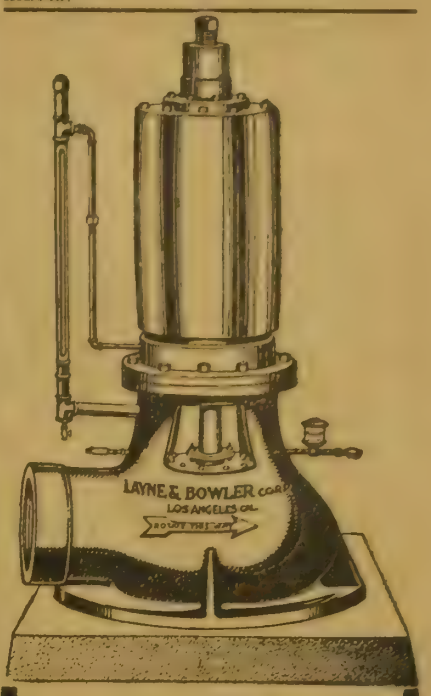
By James De Camp

When Friend Husband is talking about installing a pumping plant for stock or irrigation purposes why not prevail upon him to buy an outfit with capacity sufficient to furnish the house with an adequate water supply as well?

Tank and plumbing arrangements may be so combined as to supply running water to kitchen, lavatory and all other parts of the house. Perhaps if you insist upon it in a discreet manner, after a particularly satisfactory meal for instance, he will consent to making arrangements for that small front lawn and flower bed that you have been cherishing fond hopes of for so long, but have been unable to plant for lack of sprinkling facilities.

Here are some figures that will assist you in helping him to estimate just what additional pressure and supply will be needed for household purposes:

Each member of the family will require about 25 gallons per day for all purposes, such as bath, water closet, kitchen, laundry, etc.



From seven to ten gallons are required to flush the ordinary lavatory.

Thirty gallons will fill the average bath tub.

With 40-50 pounds pressure an ordinary garden hose nozzle will use about six gallons per minute giving a steady stream or four gallons per minute when spraying.

Nearly eight gallons are required to sprinkle 100 square feet of lawn while 16 to 20 gallons will provide a thorough soaking for the same area.

Be sure to have Friend Husband write to one of the large pump and supply companies for further expert technical information and price estimates.

A NEW

Layne & Bowler
IRRIGATION PUMP

—Light Duty
Full Floating Belted Head

Designed for the application of up to 60 horse power. Can be used for delivering water direct into mains or into elevated tank.

All bearings in head are lubricated by positive circulating oiling system. This type of head equipped with ball bearings of latest design. Can be equipped with any size of runners to permit various capacities of water, depending upon the total lift.

Household Department

DOUBT

Upon this earth we walk about,
There's altogether too much doubt.
Men doubt the books upon their shelves
And doubt their neighbors and themselves.
They doubt the strength that they possess,
And doubt their fellow man's success.
They doubt the motives of a friend;
Doubt that the present woe will end,
Yet joy returns and truth exists
And sunshine clears away the mists.

This life appears to be a bout
With the remorseless foe of doubt.
On every hand its troops are placed
And everywhere its guns are faced.
Who yearns to reach a mountain peak,
The beauty of the world to seek,
Must overcome the doubt that's spread
Like tangled weeds where he must tread.
Believing with a faith sublime
That he shall reach the top in time.

There is no sustenance in doubt;
No strength to heart or muscle stout;
No courage for the hour of test;
Its fruit is tasteless at the best.
Its record is unfinished deeds
And vanished hopes and broken creeds
And failures sad, and goals ungained,
And splendid victories unattained.
It has no future life of bliss,
And steals away the joy of this.

Believe in God, believe in man!
Put faith in everything you plan.
Believe you have the power to do
What tasks the day shall bring to you
And be so strong in faith that when
You meet the common griefs of men,
You still can bear with sorrow's pain,
Knowing that joy shall come again.
Live out your life with courage stout.
There is no manliness in doubt.

—Edgar A. Guest.

BRINGING AMERICAN PRISONERS OUT OF GERMANY

By Lee Shippey, France

TRAVELING in France has not been a joy forever since the war began. Long transcontinental trips such as are common in America have been rare here, and such sleeping car service as we have at home never has been necessary here. Since the beginning of the war travel has been so congested that though the railroads have striven hard to please it has been impossible. A railway journey has been and still is a thing almost to be dreaded.

But there have been—and still are—20 trains in France which are models of comfort, the 20 United States sanitary trains built to order for the American government for the transportation of sick and wounded from the front to the base hospitals.

I was a passenger when five of these trains completed one of the pleasantest and most appreciated tasks the American army has performed, the bringing out of Germany of the American prisoners of war.

As a Red Triangle worker, taking supplies for the comfort and pleasure of the prisoners, I was permitted to accompany two trains—54 and 55—on that very interesting mission and was so impressed by the service they are rendering and the high standard of their personnel that I am eager to write about the work of these splendid men and women.

You may imagine what a cheer went up from the Americans who had been herded out of Rastatt prison camp, herded across Switzerland and expected to be herded into box cars there for transport to France, when 54 and 55, with the beloved letters "U. S." painted large on their sides and ends, and with American flags fluttering from every window, swept into Geneva to meet them. From the windows, too, protruded American faces and shoulders clad in American uniforms, and, yes, by George! American girls!

"Say, guy, is this on the square? Are these trains really for us?" asked the first prisoner who climbed aboard.

"There's something in here you haven't seen for a long, long time, fellows," shouted another, poking his head out of a window to give the good news to those still on the platform. "It's pillows—p-i-l-l-o-w-s!"

"And what are those white things on the beds?" demanded another. "Seems like I have a vague recollection of seeing things like that years ago. Are those what they call sheets?"

They came trooping on like schoolboys, joking and frolicking and shaking hands fervently with the officers and nurses and enlisted men. And they broke into song which one of them, Harry L. Sheffield, of Company B, 307th Infantry, had composed and which they had sung in prison, in defiance of the frowns of their German guards. It was to the tune of "Are you from Dixie."

"Would the Huns stand for your singing?" I asked.

"They had to," said a happy "First Loot." "At first they didn't understand it, and it was an established thing before they did. And it was literally true. When we first got to camp the rations were so poor that we were starving and we were eager to work on kommando—work out, that is—where we would get a chance to steal something to eat. Those of us who got to work about supply depots were in great luck and many a hungry man took a chance on being cracked over the head with a lueger to get a taste of any knd of food."

"Yes, they didn't mistreat us as they did the other prisoners, particularly the Russians and English. Forty thousand Russians died at Rastatt and only nine Americans. Our Young Men's Christian Association Cabinet and American Help Committee kept us informed as to our rights, and when the guards tried to abuse us we stood up for ourselves."

"Yes," said J. B. Yatman, a private from Hartford, Kansas, "if it hadn't been for the Red Cross we would have starved, and if it hadn't been for the Red Triangle we would have wished we were dead, anyway."

"But you fellows all look healthy and happy," I said. "You don't look as if you had been mistreated."

"That's because of the Red Triangle and the Red Cross. After the Red Cross packages began reaching us we were much better fed than the Germans. We'd continue to take their rations every day—one loaf of bread for five men, one bowl of 'barbwire' soup and one cup of substitute coffee.

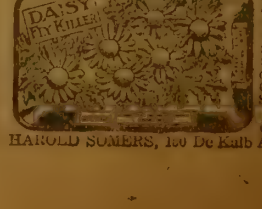
"Our soup was half grass and sometimes was made of beets cup up, worms and all! It had no meat or essence of meat in it, except when they had butchered dead war horses."

"And maybe you'd like to know our opinion of the greatest hero of the war," suggested Sergeant H. A. Bergman of New Haven, Connecticut. It was Conrad Hoffmann. Hoffmann was an American Triangle worker, but at the beginning of the war he was in Berlin and somewhow he managed to stick and organize a force of Y workers from neutral countries who kept things moving at all the camps. It was Hoffmann who got to us the instruments for our twenty-piece band, our eight-piece orchestra and our bugle corps. I organized the band and Clyde Grimsly of Salina, Kansas led it till he got sick, after which I led it. It was a good band and kept things lively in Rastatt. Every night it played taking turns in the different barracks. We got up a musical show of our own and rented the biggest theater in Rastatt. We played at football, and nine sad times—the times when our comrades died—played at their funerals, leading the procession, followed by the coffin, draped with an American flag. We had to make our American flag of our blue and red and white tobacco sacks, but it looked mighty good to us."

A POOR EXCUSE—BUT

In the good old days when everybody ate butter, the king of the happy country addressed his jester thus-wise:

"Thou fool, give me an illustration of that old adage, 'A bad excuse is worse than no excuse,' and haste thee!"



The jester at once affectionately embraced and kissed the mighty monarch.

The king did wax wroth.

"Thou varlet! How darest thou to take this liberty?"he spluttered.

"I beg your majesty's pardon," replied the merry one. "I thought it was the queen!"—Cincinnatti Enquirer.

DAISY FLY KILLER PLACED ANYWHERE ATTRACTS AND KILLS ALL FLIES. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 5 by EXPRESS, prepaid, $1.25.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N.Y.

The Cultivator Patterns

9016—Ladies' Shirtwaist. Cut in sizes—36, 38, 40, 42 and 44 inches bust measure. The collar is knotted at the front to form the tie and it is edged all around with a gathered frill.

9021—Girls' Long Waisted Dress. Cut in sizes—4, 6, 8, 10 and 12 years. The semi-belt is joined across the front by narrow ribbons which tie loosely.

9008—Ladies' One Piece Apron. Cut in sizes—36, 40 and 44 inches bust measure. The apron is cut all in one piece and the straps at the back close the apron by crossing and buttoning on each shoulder.

9038—Ladies' Kimona Waist. Cut in sizes—36, 38, 40, 42, and 44 inches bust measure. The overblouse is of contrasting material and is separate.

9044—Girl's One Piece Dress. Cut in sizes—4, 6, 8, 10 and 12 years. The plaits are stitched flat above the tabs and left open for extra fullness below.

9045—Ladies' Nightgown. Cut in sizes—36, 38, 40, 42, 44, and 46 inches bust measure. The neck is collarless and may be either round or V-shape.

9036—Ladies' and Misses' Two Piece Skirt. Cut in sizes—16, 18, years, and 26, 28, 30 and 32 inches waist measure. There is a deep tuck and also a deep hem at the lower edge of each panel.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

SEPARATE SKIRTS

By E. J. Canady

There are many things that we can do without, but the separate skirt is not one of them, for it is a necessity. The blouse and skirt are suitable for any hour of the day and are more economical than the whole dress, for only the blouse is washed frequently. The popular materials for skirts are serge, poplin, gaberdine and various kinds of silk. They may be made of plain straight widths plaited all around, or plain gores in the front and back, and plaited gores on the sides; in fact the styles are so varied that one should be able to find one suited to every need, and they were never more graceful nor attractive. Many are entirely untrimmed, depending upon the cut and finish, and the arrangement of pockets for their style.

Before deciding to buy material for a skirt, let us examine those we have on hand, to see if there are not several that can be used again. It will mean the saving of several dollars, for every kind of material is expensive. Skirts of last season are all right if carefully renovated. They will need a thorough brushing, and if they are hung on the line where the wind will whip them an hour or two, it will freshen them wonderfully. Spots may be removed with a good cleaning fluid, or the skirt may be washed in gasoline and pressed, which makes it look like new.

Skirts are narrower than they were a year or two ago, measuring from one and one-half to two yards (pleated) which makes it easy to cut an old one over. It should be taken apart and brushed to remove the loose threads, then if the material is faded, or you wish to make it a darker color or black, you can accomplish it very easily by the use of dye of the chosen color. When the pieces are carefully pressed, lay your pattern on them to decide how to cut to the best advantage. Use good patterns. They are cheap, and there is no use in wasting time, patience and material in trying to do without them. Match the notches and pin the seams every few inches before basting to be sure that one side is not held looser than the other.

Your skirt must be perfectly even around the bottom if it is neat and attractive looking, and it is a great help sometimes to be able to even it without assistance from anyone. Cut a notch in the end of a yard stick, and fasten a piece of chalk in it. When the skirt is done except the hem, put it on, and make a mark with the chalk all around the skirt, being careful to keep it just three feet from the floor. Take the skirt off, and if you wish to clear the floor six inches, measure down from the chalk mark 30 inches, and mark the lower edge of the hem.

Careful pressing will give your work the tailored look that is so much admired. Every seam should be pressed as soon as it is made, and the whole skirt pressed when it is finished. Attention to details insures success in dressmaking.

COACOANUT AND MARMALADE JELLY

Two and a half tablespoons gelatin.
One-half cup cold water.
One cup hot milk.
One-half cup cold milk.
One-fourth cup peach, plum, orange of other marmalade.
One cup canned cocoanut.
Corn syrup.

Soak the gelatin in the cold water for five minutes; then dissolve it in the hot milk. If the milk curdles, beat it smooth with an egg beater. Add the marmalade. Add sufficient corn syrup to the milk drained from the cocoanut to make one cup. Add this to the hot milk. Stir the mixture well and when it is cold add the cocoanut and the cold milk. Pour it into a mold, and chill. The marmalade may be used to garnish the pudding instead of being molded into it.

TO THE BUILDER

Builder, while ye toil and slave,
Stint no whit thy daily task—
Fair performance day by day,
This is all thy masters ask,
When thou buildest, build thou well.
Build thou broad and deep and high—
More especially we'd impress
If you're building apple pie.
—Buffalo News.

We Have a Piano for Every Home

In "straight" Pianos we carry a make to suit every home—***to fit every purse.*** Bear in mind, however, that a good, dependable Piano cannot be made to sell new under $300, though we have good used pianos from $200 upward.

In the least expensive grade we offer the **Aldrich,** a good, dependable piano, at a very moderate price—it will give excellent service.

The next group includes the **Kurtzmann, Emerson** and **Estey** Pianos—three very substantial "makes," which are giving a lifetime service in thousands of homes and schools throughout the United States.

In the next grade we have the **Krakauer, A. B. Chase,** and **Weber**—these are high grade instruments—old and famous makes.

Then comes the **Steinway,** the ***Standard*** by which all pianos are judged — to have a Steinway is to have the **Best.**

We will arrange convenient terms of payment on any Piano—even the Steinway.

It is really ***an easy matter to own a Piano*** —come in and talk it over with us—we will serve to the best of our ability.

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has **averaged from 20 to 45 bushels of wheat to the acre.** Hundreds of cases are on record where in Western Canada **a single crop has paid the cost of land and production.** The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want **the farmer to prosper, and extend every possible encouragement and help to**

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, **the high prices of grain, cattle, sheep and hogs will remain.**

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

LIVE STOCK

A weakened tendency of the market for beef cattle existing in all the large Eastern markets is reflected in the lower prices paid locally. Today's Kansas City market quotations indicate top of $18.75 for prime steers but the highest price paid this date was $17.50. There were no prime steers offered. The extreme price paid locally for good steers in killers yards is $12.50 and the market is weak at this figure. Some extensive producers of beef have stated that they do not expect the market to reach the high level of the market six weeks ago.

The supply of hogs is still very light. Quite a number of carloads of good hogs are bringing $19.50 f. o. b. this city. Today's prices in Chicago for top hogs range from $21.10 to $21.35 with one load of extra nice porkers at $21.55, a new record.

The local lamb market is strengthening. The supply is not so liberal as for the past two weeks.

The following prices for California lambs were paid on the Omaha market May 6th: 524 lambs, 62 pound average, $19.60, with 50 weighing 56 pounds at $16.50; 592 lambs, 63 pounds average, $19.75, with 51, 59 pounds at $16.50.

In sympathy with the lamb market, wethers and ewes follow the trend of the market up and down and since the lamb market is showing a better tone so also is the sheep market.

Good steers	12.00@12.50
Medium steers	11.00@11.50

Rye: 3.65@3.85.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No .3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 40.00@43.00; shorts, 42.00@45.00; middlings, 50.00@52.00. Rolled barley, 52.00@54.00, alfalfa, 30.00@32.00; scratch feed, 3.50 per cental. Linseed oil cake meal, nominal; cocoanut cake or meal, 20 tons, 41.00 per ton; 10 tons, 41; 5 tons, $41.50; less quantity, $42; smaller lots, higher proportionately.

HAY

Under date of May 3, Scott, Magner & Miller says:

Receipts past week 2288 tons. New volunteer hay is being harvested in many sections and can soon be looked for on the market. Within a week some will be baled in all probability. New alfalfa, first cutting, is being baled in some sections, and the first car of new alfalfa hay arrived during the week and was handled by the consignee. Hence, no market price can be quoted at present. Reports from country districts are that a few sales of volunteer hay have been made from $10.00 to $11.00 per ton and some fancy clean first cutting alfalfa has sold as high as $12.00 to $13.00. Alfalfa with foxtail, however, is everywhere being offered in quantities but has not met with any encouragement.

Weather conditions around the Bay sections have been most favorable for hay crops, some sections however are badly in need of rain and unless received shortly the yield will be materially lessened.

We quote today wholesale prices in car load lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

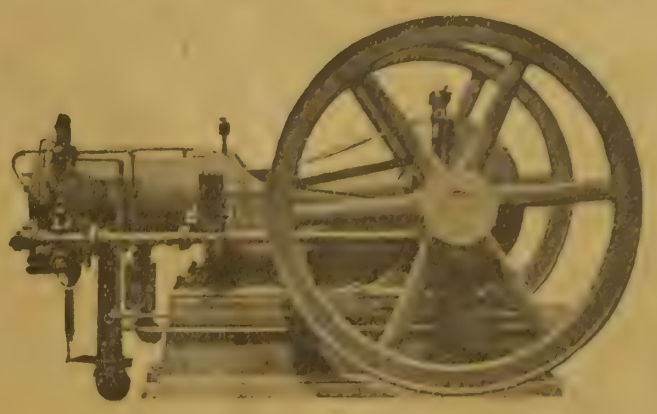
Fancy Wheat Hay (light 5 wire bale) .....21.00@23.00
No. 1 Wheat or Wheat and Oat Hay .....17.00@19.00
No. 2 Wheat or Wheat and Oat Hay .....13.00@16.00
Choice Tame Oat Hay .....17.00@19.00
Other Tame Oat .....13.00@16.00
Wild Oat Hay .....12.00@15.00
Barley Hay .....12.00@15.00
Alfalfa Hay .....16.00@20.00
Stock Hay .....12.00@14.00
No. 1 Barley Straw, bale.....50@80

Citrus Fruit Market

Los Angeles, May 7, 1919.

Lots of decay showing up, and this is making some disastrously low sales, especially of Navels. There are now left in the state but little more than 300 cars of Navels, and perhaps half that number of miscellaneous varieties. Valencias will be the principal factor in the market from now on.

The lemon market is very satisfactory, and while the nearer Atlantic Coast auctions show some unfortunate sales, inland markets are commanding between $3.00 and $4.00 with good demand.



Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: Oranges 18,906 cars, lemons 4509, total 23,415. To same date last season: Oranges 8624, lemons 2349, total 10,973. Central California this season: Oranges 3301, lemons 354, total 3653. Last season to same date: Oranges 2441, lemons 115, total 2556. Northern California: Oranges 244, lemons, 2; last year same date 202.

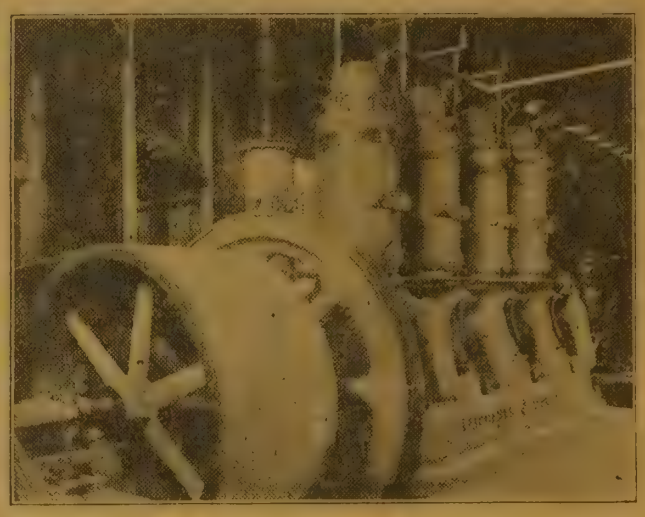
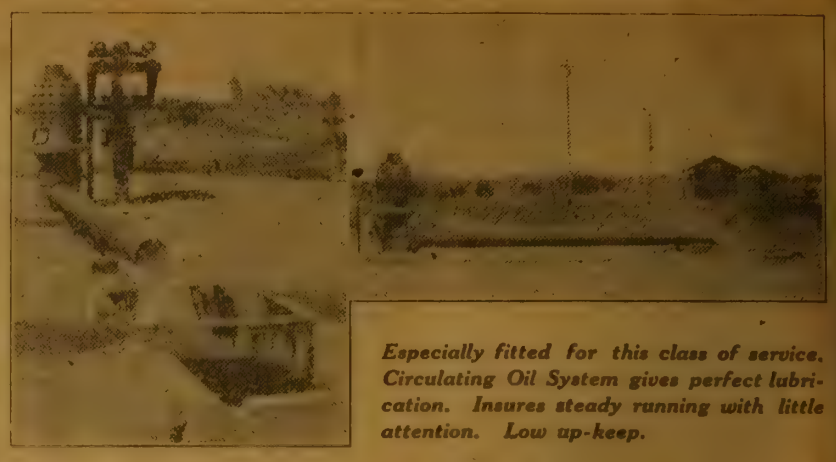
Make Money With Alfalfa

No better opportunity for profit is presented to the Western rancher than is possible from the cultivation of that money crop — Alfalfa. To raise alfalfa profitably, however, an efficient irrigation system is absolutely essential. For this purpose nothing can possibly compare with the



K-T System of Irrigation

—which is today in general use by successful ranchers all over the country.



Write for any information you require on the subject of irrigation—the advice of our experts is free. Interesting literature on request.

POMONA COLLEGE
CLAREMONT, CALIFORNIA

March seventeenth 1919.

Fairbanks, Morse & Co.,
Los Angeles, Cal.

Gentlemen:

In answer to your inquiry as to results obtained from the use of your Type Y, Semi-Deisel 25-H.P. Engine at our plant north of Claremont, would state, the installation was made in May of 1916 to operate a plunger pump with a head of 32", the water level in well being 160 ft. from the surface, with an additional boost of 28 ft. to a reservoir.

There have been no repairs to date, except one new firing pin at a cost of less than $1.00. This seems quite remarkable as the plant has irrigated about 120 acres during the season and has furnished the domestic supply for Pomona College, Claremont Inn, and a large swimming pool during the entire year. The College has over six hundred in its student body and a campus of 120 acres, so you can know the plant has not been idle. As to the operating expense, the engine consumes on an average about 2 gals. per hour of smudge oil, which tests 24° to 27°, which so far has cost us only 3½ per gal. delivered at plant. The lubrication cost us at first about 3¢ per hour, but with the advance of prices it is somewhat more now.

I will state that all you claimed for the Type Y has proved true, and the perfect performance of this engine and the efficient and courteous service of your employees has been a great source of satisfaction.

Yours most truly,

Fairbanks, Morse & Co.

New Mitchell Sixes

New Victory Model

Over 100 Improvements
50% More Strength

To Meet the Call

For a More Enduring Six

Some years ago, when most cars were too heavy, there came a demand for Light Sixes.

There came a rivalry on lightness, and makers went too far. There came also a price rivalry, and the fierce competition led makers to skimp. The average Six was built too small, and quality standards were not high enough.

Years of experience have shown the mistake. Extreme lightness is not economical. A cramped car is not comfortable. Makers have found and users have found that such cars lacked endurance. Men want better cars in these days when cars are bought to keep.

The mistakes were natural, but ideas have changed. The great call now is for a sturdy car that lasts.

Here Is the New Idea

This new Mitchell shows the new idea. It is more than a new model — it marks a new epoch. Inside and outside it is based on new standards.

The changes are radical. Not in years has any new model of any type shown so many great advances.

There are more than 100 improvements. The average strength increase is 50 per cent. Endurance is increased 75 per cent.

Despite added weight, the operating cost is reduced 25 per cent. Comfort and beauty are increased 20 per cent.

All Done in Two Years

This car was started two years ago. We employed many new specialists to help us create it. Soon after that the war came, and the great Mitchell factory went into truck building.

That gave these experts their great opportunity. During all those months they developed this car part by part. They studied every requirement and met it. They reviewed the records of tens of thousands of cars to learn the changes needed.

They spent $250,000 for new machinery and equipment, for finer workmanship and more accurate tests. And they trained a staff of 135 inspectors to watch every detail, to analyze and test.

Cannot Be Too Good

This new Mitchell is built on the theory that cars cannot be too good. We have made it roomy — 120-inch wheelbase.

There are new gears, a new frame, a new rear axle, a new crank shaft, to add 50 per cent to the strength. There is a new disc clutch. Brake efficiency is increased 75 per cent. There is a ball-bearing steering gear. There are 123 drop forgings. There are rear springs which have never been broken.

There is a thermostat in the water system. The gasoline is completely vaporized. These with motor changes, save 25 per cent on fuel.

There is a new body design, a new, enduring top. There are four coats of varnish, instead of the usual two.

Write us for complete description, or let your Mitchell dealer show all the changes to you.

A Price Surprise

When you compare this car with others you'll expect a costly car. You will see a hundred betterments, and many are expensive. But the price is lower than any car of like size, power and class.

The Mitchell plant has long been famous for its wonderful efficiency. All these new standards are paid for by that saving. We build the complete car — motor, chassis and body — under scientific methods.

Write us for all the facts.

The Tractor Demonstration

By M. C. Holman

ABOUT six miles north of Sacramento on the main highway is Arden Acres, an almost level stretch containing more than a section of land. On this piece of ground the California Tractor and Implement Association staged its second annual demonstration last week.

The demonstration was a success from many standpoints. It was successful in point of attendance and that means that it was a general success, for attendance is what is wanted and most desired. It was successful in point of general arrangement, which was the best that could be had when we consider that each exhibitor demands a good space for the proper working of his tractors. It was successful from a field standpoint as the ground was of such a nature as to make it apparent to every visitor that the tractors and plows were having a severe test to cope with the hard, dry clay. And the demonstration was successful in point of actual buyers for some very creditable sales were made. The sales were made without any hammer and tongs salesmanship. The buyer had an opportunity of estimating relative values of the machines for his particular class of work. He saw and was won to the merits of his purchase.

This demonstration has successfully eliminated the side-show features which have obtained in former demonstrations. There were no dare devil stunts, no circular motions, no hill climbing, no effort to show that the tractor could do what it would never be expected to do. It was an educational demonstration from every viewpoint, educating the farmer to the practical benefits to be derived by using tractors.

The grounds resembled very much a tented city. Canvas was spread at many points and sheltered various exhibits.

But it was not difficult for one to cover the ground and see all the tractors at work during the period from 10 to 12, when the collective demonstration took place. The general field of demonstration covered an entire side of the tract and one could see the various types working side by side and make comparison of the mechanical features and the adaptability to one's needs.

The manufacturers of tractors are desirous of educating the people into the fitness of the tractor for general farm use.

We do not believe that a more severe test was ever placed upon tractors and plows at a similar demonstration. Conditions were abnormal. The regular plowing season is over and the scarcity of rain in the Sacramento Valley made the ground particularly hard and dry. To turn it over required great pulling power coupled with the sturdy plows. The tractors held up wonderfully well and only in one or two instances did the plows need any special attention. If they can do so well under severe conditions it is pretty convincing proof that they will meet all normal demands and that the user will get the very greatest satisfaction out of his machine, provided, of course, that he takes good care of it and does not overload it.

Naturally there were large and small tractors, wheel tractors and tracklayers. They vied in friendly competition. California conditions are so varied that there is a place for every size and style. For heavy work over large areas one has a choice of the Holt and Best 75, the Yuba 40-70, or the large Avery. These machines successfully pulled combinations of mold boards and disk plows and sets of heavy disks to a depth of 10 and 12 inches.

Not so heavy, yet fully capable of reasonably heavy work, are the second size Holt, Best and Yuba, the Sandusky, J. I. Case, Lauson, Monarch, Russell and Cleveland.

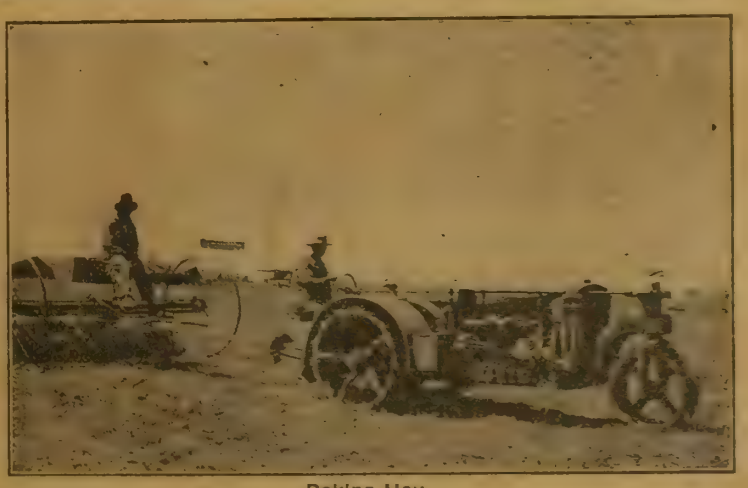
Of medium strength and suitable on hundreds of California ranches are the Samson, Fageol, Bates, Fordson, Wallis Bear Cat, La Crosse, Waterloo Boy, Emerson, I. H. C., Knight-Lee, Huber, Twin City, Moline Universal, Velie, and Little Giant.

(Continued on Page 689)

Glimpses of Arden Acres

All photos of the great tractor demonstration were taken by Mr. Holman of the San Francisco office of the California Cultivator. There was a bit of dust in the air now and then which prevented photographing exactly as desired, but the tractor at work as shown in the illustrations in this issue will, we trust, prove educational to tractor buyers.

Upper engraving Mrs. D. M. Finch driving the Holt 75 with 8-14 combination disk and mould board plow. The plowman was putting the plows in 11½ inches deep when this photo was taken.



Big 40-70 Avery pulling 12 12-inch mould board plows.

Yuba 15-20 pulling four 10-inch mould board plows.

Wallis pulling four 24-inch disk plows.

Pulls Its Load Easily
The big J. I. Case walking away with the disks.

Raking Hay
The Samson is as strong as its name, but at this instant it is doing some light pulling at four and one-half miles per hour on high gear.

Agricultural News Notes of the Pacific Coast

Northern California

Ukiah reports contracts for prunes at 11¼ cents.

Colusa County citizens are agitating for a good roads campaign.

Material is being delivered in Colusa for the big new rice mill.

Humboldt County reports the building of several highway bridges in the county.

Poultrymen of Eldorado County are considering the formation of a county association.

Many Butte County crows are meeting death through dining on the poisoned barley furnished for the squirrels.

Investigations as to cause and control of citrus blast are to be made in Butte County by the county farm adviser and federal experts.

The first plantings of spinach made in Eden Township, Alameda County, have been very successful. Growers averaged three tons to the acre.

Mildew is threatening some of the wheat fields of Yolo County; it is hoped that warm days will soon put an end to the danger of its spread.

A mosquito abatement district has been formed at Anderson, Shasta County. The district is to include a mile wide section around Anderson.

The first monthly auction sale of the Eldorado County farm bureau was a complete success. The next sale will be held on the last Saturday in May.

Farm Adviser Sweet of Butte County will resign from his office July 1 to return to his work in the department of pomology of the state university.

Fruit growers of Mt. Vernon, Edgewood, Long Valley and other nearby districts will conduct a community packing house this season in Auburn, Placer County.

The entire pack of the Oroville plant of the Pacific Coast Mercantile Company was Greek, Italian and Calamarta olives. The entire pack was shipped East.

A clip of 85,000 pounds of wool was shipped from Maxwell, Colusa County, last week to Boston. The clip was the property of F. R. Mendosa and was sold at 50 cents per pound.

The California Prune and Apricot Growers is holding a series of meetings in some 40 different sections of the state to discuss business of the association and to conduct a membership campaign.

The Fourteen Counties Protective Association held a mass meeting in Sacramento last Tuesday to devise means of combatting the present tendency to allow Japanese and Hindus to settle on the most fertile lands of the state.

Shipments of lettuce from Oroville to Idaho have been started by J. H. Leggett, who says that most of this trade has heretofore been supplied from Los Angeles and that he sees no reason why Oroville with its shorter haul should not take advantage of this opportunity.

Negotiations to compromise the two suits brought by Colusa County against rice growers are now under way; the defendants to the actions are E. V. Jacobs, J. S. Hankins and the Willows Rice Company in one case, and Maria Hagan, Frank B. Hagan, John Lausten et al, in the other.

Central California

Offers of as high as 18 cents for dried apricots are reported.

There are considerable plantings to roselle in the Turlock district.

An immense crop of olives is reported in the orchards of San Luis Obispo County.

Stanislaus County farm bureau holds a fat hog auction at Tegner Friday of this week.

The creamery at Oakdale, Stanislaus County, is turning out 6000 pounds of butter daily.

San Luis Obispo County horticultural commissioner is making a strenuous squirrel campaign.

The packing house handling fish of Monterey section reports large demand for salmon and other fish.

N. E. Luce, federal poultry expert, is now in San Joaquin County giving advice and help to poultry raisers.

Kings County farmers are reporting prices as high as 18 cents for dried apricots and 15 cents for dried peaches, next fall's delivery.

Live stock men of San Luis Obispo County recently met in the state polytechnic school and organized the S. L. O. County Stockmens Association.

The Uneeda Creamery at Lodi has changed hands, being sold to N. Jensen and C. Bladh. Mr. Bladh has been manager of the Cooperative Creamery at Bakersfield.

The California Farm Bureau Market Association has issued an open letter to all swine breeders that it is not in the market for any but good hard grain fed animals.

The prune growers expect their crop to be double that of last year and to safeguard the market are urging all their brother growers to join the California Prune and Apricot Growers' Association.

Railway people have served notice on stockmen of Monterey and Santa Cruz Counties that chemical weed killers have been used on weeds along tracks and that the weeds will be poisonous to live stock.

Horticultural Commissioner Rutherford of Stanislaus County has just completed a tour of inspection of the county and says crops of all kinds give promise of large yield. The fruit in the eastern part of the county is fully two weeks ahead of other sections.

The Alfalfa Growers of California met in Delano May 1. One hundred growers were present and were representatives from Weed Patch, Bakersfield, Panama, Rio Bravo, Rosedale, Shafter, Wasco, McFarland, Strathmore, Tulare, Pixley, Tipton, Quail, Earlimart and Delano.

At a mass meeting of bean growers of Merced and Stanislaus Counties at Turlock, May 3, resolutions were passed petitioning congress to place a high tariff on foreign grown beans and to take steps for immediate sale of American beans grown at the request of the food administration.

It is estimated that 10,000 acres are planted to cantaloupes in the San Joaquin Valley. This acreage is located principally in Stanislaus, San Joaquin, Merced, Tulare and Kern Counties, the Turlock district having the largest plantings. Growers report considerable difficulty in securing a stand, but are endeavoring to bring it up to normal by replanting.

Southern California

A new cotton gin will soon be erected at Brawley, Imperial County.

Sale has been made of 80 tons of apricots in the vicinity of Elsinore for $55 per ton.

Fifty-five dollars for Cling peaches is being offered in Hemet Valley, Riverside County.

A new sorghum syrup factory is announced for the near future in the Pomona-Chino district.

Members of the Hemet Apricot Growers Association are organizing to secure labor for the coming fruit season.

Imperial is sending out express shipments of early tomatoes. Most of the acreage in tomatoes is handled by Japanese.

Imperial water users have sent Phil D. Swing to present the needs of their irrigation district to the called session of congress.

The rains and moist weather of last week proved most acceptable to grain and will save some crops from the making of hay.

Local meetings of the Imperial County farm bureau at Alamo-Verde, May 20; Mesquite Lake, 21; Acacia, 23; Central-Highline, 27.

A poultry institute will be held at the Mission Play theater, San Gabriel, May 26-29. It will be conducted by J. E. Dougherty of the state university.

The Blackeye bean growers of Orange County have formed a pool of their beans and will hold on to their crop until midsummer when they expect to get better prices.

The Yucaipa Apple Association is faced by a serious need for housing accommodations for the workers who will be needed at the coming harvest, and is taking steps now to meet the problem.

It is being urged that the permanent highway between Blythe and Mecca in Riverside County be made through the Chuckawalla Valley instead of following the course of the old road.

During the year the shipment of milk from the San Jacinto district of Riverside County has increased from 20 to 120 cans daily, and there is a steadily growing interest in the dairy business.

Dr. J. Eliot Coit, who has been farm adviser of the Los Angeles County farm bureau since its formation, will resign on June 1 to take up again his work in the college of citriculture of the University of California.

It is too early for any predictions but the heavy bloom of orange trees is most promising for good citrus year. Navel orange shipping season is nearing its end and Valencias will soon be in full possession of the market.

Melville Dozier of the state reclamation board and George W. Peltier of Sacramento have been making a tour of Southern California; investigating conditions in this part of the state and asking help for a plan to put control of flood waters under the state.

Meetings of the Los Angeles County farm bureau will be held at Lamanda Park and La Verne, May 19; San Dimas, 20; Artesia, 21; Owensmouth and Newhall, 22; Pomona and Inglewood, 23; Burbank, 25; Little Rock and Monrovia, 27; Del Sur and Roosevelt, 28.

The Coast and General

Stock ranges in the Southwest generally are in good condition, except in northern Idaho where stock is reported rather thin.

Veterinarians of the state of Arizona are planning a big state convention to be held in Phoenix some time in the near future.

The highest quotations for Long Staple Egyptian cotton were 56 to 59 cents at New Bedford. Yuma variety is quoted at 50 to 52 cents.

Oregon reports crops generally good but rain is needed, apples and prunes setting heavily, ranges turning dry, but stock in good condition.

An effort is to be made by the Arizona state game warden, Joe V. Prochaska, to introduce Eastern clams into some of the Arizona streams.

Farmers of the Salt River Valley, Arizona, are beginning to cut the first crop of alfalfa and it is estimated that 75 per cent of it will be first class.

Railroads are refusing to ship melons from Georgia without prepayment of freight unless melons have been treated with stem end paste to prevent rot.

There will be expended in the Tonto forest reserve, Arizona, the sum of $76,500 for building a bridge across the Salt River and for improvement of roads into the Pleasant Valley country.

Wholesalers are paying 47½ cents a dozen for fresh ranch eggs in the Phoenix district of Arizona. This is an advance over a week ago and said to be due to a shortage which cannot be supplied from outside sources.

The so called "Dry Landers", being the owners of lands within the boundaries of the Salt River project, have recently been granted water rights. This will increase somewhat the acreage of cultivated land in Maricopa County.

Major Andrew Drumm, who recently died at San Antonio, Texas, was in his earlier years, a well known cattleman of Arizona. He was at one time a part owner of the "Double Circle Cattle Ranch" in Gila County. In the early '50s he was a gold hunter in California.

Under an agreement reached between the United States Indian service and the land owners of the Florence-Casa Grande Valley, a dam will be constructed at Florence which will include 35,000 acres of Indian land and 27,000 acres belonging to the white settlers.

There has been some disappointment among Arizona autoists that the $30,000 appropriation made by the Arizona legislature for building a bridge across the Colorado at Parker was not met by similar appropriation from the California highway department. This means that there will be no bridge across the Colorado at Parker for some time to come.

A meat packing plant to cost $500,000 is to be built near Phoenix. This, it is hoped, will furnish a market for all hogs that may be produced in the Salt River Valley, and the promoters promise that the prices will be the Kansas City prices less the freight, which should mean not only better prices for home grown pork, but a considerable saving to the consumer as well.

51st Fruit Growers and Farmers Convention

MUCH of the history of California horticulture is found in the proceedings of its annual or semi-annual State Fruit Growers' Conventions. These conventions were started first under the jurisdiction of the old state board of horticulture. For many years the late Elwood Cooper was president, and when the board was abolished and the commission created Mr. Cooper became the first commissioner. Later commissioners were J. W. Jeffrey, the late Dr. A. J. Cook, and the present commissioner, George H. Hecke. The activities and the work of the commission have greatly increased during the past few years, insectary, quarantine and other divisions have been added, and the commission has become a great factor in California horticultural work.

At first the convention covered the field of transportation, tariff and other legislation, and the larger phases of state horticulture. Later conventions also included matters cultural, and now the scope has been again enlarged, and, as noted in the heading above, the State Fruit Growers' Convention has become the State Fruit Growers and Farmers' Convention. These conventions have been held annually, and sometimes semi-annually. It is now more than a year since the last convention was held, but this convention was scheduled for last fall at Riverside. It was deferred because of the "flu."

Still another enlargement of activities has been noted the past few years and other organizations have chosen the same place and time of meeting until it has become a great producers' week.

In addition to the Fruit Growers and Farmers' Convention there will be held a Interstate Plant Quarantine Conference, California County Horticultural Commissioners' Convention, Convention of the California Association of Nurserymen, Vegetable Growers' Conference, Pacific Slope Branch American Association of Economic Entomologists' Convention.

The Mission Inn will be headquarters, but for those who prefer camping the city has extended courtesy of camping privileges in beautiful Fairmount Park where firewood and cookers, shower baths, plunge and toilet, boating on the lake, ample shade for campers and autos, all are provided free of charge to those wearing the convention badge.

OUTLINE OF PROGRAM

May 26, 9:30

The first event on Monday morning will be roll call of county horticultural commissioners. Interstate plant quarantine conference, Commissioner Hecke presiding. It is expected that C. L. Marlatt, chairman federal horticultural board, will be at this conference, also at conferences of nurserymen, to discuss matters of national quarantine. Governor Cantu of Lower California will also be present. The California Association of Nurserymen will also convene at 9:30. Outline of program next week:

1:30 p. m. Interstate Plant Quarantine Conference. Quarantines, Their Purpose, etc., Frederick Maskew; What Constitutes Grounds for Rejection of Nursery Stock, Dr. A. W. Morrill, Arizona state entomologist. Also at 1:30 Vegetable Growers Conference, Deputy Commissioner Weldon presiding. Uniformity of Rules and Regulations of Potato Seed Certification, E. P. Taylor, Arizona; Potato Seed Certification, Mrs. Hilda B. Nielsen, Sebastopol.

8:00 p. m. County Horticultural Commissioners discussion of horticultural legislation of 1919.

May 27, 9:30

Interstate Plant Quarantine Conference. Interstate Quarantine on Alfalfa Weevil, W. W. Henderson, Utah crop pest commissioner, and R. R Hagan, Utah state crop pest inspector. Interstate Quarantine on Potatoes, M. L. Bean, chief division of horticulture, Olympia, Washington.

Vegetable Growers Conference, Eugene Grubb presiding. Effect of Good Seed, E. R. Bennett, Idaho; Vegetable Seed Improvement, S. S. Rogers, University of California.

May 27, 1:30

Interstate Plant Quarantine Conference, Commissioner Hecke presiding. Pink Bollworm, C. L. Marlatt, Washington, D. C. There will be time for discussion following practically every address. In this case delegates from Florida and Arizona will discuss the addresses.

3:00 p. m. County Horticultural Commissioners, Fred Seulsberger, presiding.

8:00 p. m. Interstate Plant Quarantine Conference. Discussion of reports on policies and organization, led by delegates from Nevada and New Mexico.

County horticultural commissioners will also hold separate meeting.

May 28, 9:30

First Session State Fruit Growers and Farmers Convention to be held in Pilgrim Hall. Called to order by State Commissioner Hecke. Music, invocation, welcome, response, report on horticultural legislation, cooperative and marketing associations.

Pacific Slope Branch of American Association of Economic Entomologists, trip to citrus experiment station.

1:30 p. m. Fruit Growers and Farmers, C. C. Teague presiding. Use and Value of Crop Estimates, E. E. Kauffman, bureau of crop estimates, U. S. D. A.; Cooperative Marketing Associations; Soils and Fertilizers, Prof. Kelly, citrus experiment station; Oranges for Thanksgiving, James Mills.

8:00 p. m. State Fruit Growers at Pilgrim Hall. Addresses by Governor Stephens, C. L. Marlatt, Thomas F. Hunt, G. Harold Powell.

May 29, 9:30

State Fruit Growers, E. A. Chase presiding. Cooperative and Marketing Associations; Citrus Canker, Wilmon Newell, state plant commissioner, Florida; Land Colonization, Dr. Elwood Mead.

1:30 p. m. State Fruit Growers, H. W. Wright presiding. Cooperative Marketing Associations; Relation of Experiment Station Work to Practical Fruit Growing, J. C. Whitten, U. C.; Effect of Heavy and Light Pruning on Deciduous Fruit Trees, W. P. Tufts, U. C.

7:00 p. m. Dinner, A. N. Wheelock presiding, toastmaster to be named. Speaker, Harry Williams, war correspondent. Address, Spots and Rots, J. A. Blaisdell.

May 30, Field Day

Auto trip to Corona by way of March Aviation Field, citrus experiment station and Peace Mountain Drive. At Corona there will be opportunity for inspection of the by-products factory where luncheon will be served. Returning to Riverside there will be a stop for inspection of the buildings and grounds of the Sherman Institute and a beautiful drive thence along Magnolia Avenue to the Mission Inn.

Demonstrations of the latest methods of fumigation as practiced in the citrus groves will be given sometime during the day. These will illustrate the latest methods of fumigation by the use of liquid hydrocyanic acid gas.

Riverside is an ideal convention town and it has had a live wire committee handling local affairs for the great week. This will be one of the most important events in California horticulture.

Giving the Soil a Drink

By James De Camp

WATER and life are inseparable. Where there is no moisture existence ceases. Where there is but a limited supply growth is arrested and development retarded. Perhaps the biggest problem confronting agriculture in California is that of applying the proper amount of good old H2O at the most judicious time.

Each year agriculture becomes more of a positive science. The progressive farmer no longer relies upon the whims of the weather or a variable source of water supply which is usually at lowest ebb when irrigation is most needed. Thorough fertilization, careful selection of seed and perfect cultivation become a dead loss unless there is an adequate water supply and efficient means of distribution.

The various methods and systems of irrigation are more numerous than the suitors of a millionaire's daughter. The entire collection of practices, however, resolves into three main groups, overhead irrigation, surface irrigation and underground irrigation.

Surface irrigation is the most popular, inexpensive and perhaps the most effective, although each method of applying the water is sponsored by its particular group of enthusiasts. Ditches, trenches, flooding, basins, standpipes and a large number of other devices are used in this work. The main objection is baking or caking of the surface soil in warm weather. It is also charged that there is excessive evaporation under certain climatic conditions and that portions of the grove or crop are slighted because of variation in the absorbent qualities of the soil. There has been a great deal of controversy regarding the merits of surface irrigation on sloping land, some maintaining that the water races over the higher portions and pools at the foot of the grade, neglecting part of the soil and over-saturating the remainder. To this the answer is made that the water does not proceed downgrade until the soil over which is must pass has helped itself to all the moisture it should contain.

Underground irrigation aims to distribute the water to the exact spot where it is most needed, namely in the immediate neighborhood of the roots. Porous piping or pipe punctured at intervals or provided with ports is installed for this purpose. Experience has shown that this plan is still in need of a number of improvements. The openings have a tendency to become clogged or stopped up entirely and the whole equipment is well nigh inaccessible for cleaning or repairs. The difficulties vary with soil conditions, ranchers in some districts stating that this type of irrigation is well adapted to their specific needs.

Water for irrigation is provided by gravity flow from a supply situated on some higher level or by pumping from a level lower than that of the land which is to be served. In the former case the water is usually imprisoned behind a dam and conveyed to the scene of the irrigating by flumes. In the latter instance a pumping plant supplemented by ditches, pipes or distributing flumes must be installed.

The choice and installation of a pumping plant brings forth an unabridged catechism of kinky problems. Unless one is equippedwith a dependable technical education it is highly unwise to settle these matters alone. The large pump and machinery houses and agencies employ experts whose sole business it is to advise the farmer and plan installations with sufficient capacity and pressure to cope with local conditions. Several pump catalogues are provided with a detachable blank in questionnaire form which may be filled out with information concerning your distribution needs and will be promptly answered by an irrigation expert. The houses who do not supply this convenient form stand equally ready to consult with you and give you the benefit of their experience.

The type of pump that should be used depends upon the following points: Source of water, quantity of water required per hour, height and distance the water must be pumped from the source of supply to the distributing system, and nature of the water, whether pure and clear or gritty and muddy.

Energy to operate the pump may be supplied by electric motors, gas, gasoline, oil and steam engines, turbines and waterwheels. The electric motor is the most convenient and consistent medium for driving the pump and requires a minimum amount of attention and care. Gasoline engines are also reliable and economical but fortunate indeed is the man situated near a stream or river of sufficient velocity to turn a waterwheel, since this equipment practically eliminates operating costs.

When installing a pumping plant for irrigation purposes many fail to ob-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A fruit which is little known in California is shown on the cover of this issue—little grown but wonderfully enjoyed by those who live in frostless sections, for this is a purely tropical fruit and will never be a large commercial factor in this state. It is the cherimoya or, more often called, the custard apple. It is not a good keeper or shipper, which will also affect its commercial value. This fruit was introduced into the state in 1871, and is found growing in protected nooks from Santa Barbara to San Diego, usually near the coast. Most of the cherimoyas in this state ripen in the spring, though there are varieties which ripen in the fall. If one has a mind to experiment with rare fruits it might be possible to hybridize and grow other varieties which would grow fruit much of the year.

VICTORY LOAN

Victory with a big V was celebrated in the going over the top with subscriptions for the first Victory or the Fifth Liberty Loan. Returns are not complete and duplications are being eliminated so that it is not yet known how far over the top the loan has gone, but it is safely over.

OVERSEAS

It is very probable that before these words are read the wires may flash the news of the landing of the American airplanes on European soil. These planes are now preening their wings on the extreme eastern shores of Newfoundland and ready for the start.

$50,000,000 FOR ROADS

Pennsylvania is planning large for the expenditure of a $50,000,000 road bond fund. She proposes soon to be able to point with pride to the finest road system on earth. Meantime California has already made vast mileage of the best roads on earth and she proposes to increase the $33,000,000 already spent with at least another $40,000,000, and in the very near future.

FOR INDEPENDENCE

The Philippine Islands have a delegation now in Washington making preparations for appealing to the American congress to grant to the Philippines what the Americans have demanded of middle Europe, that is, independence, or power of self government. It is presumed that congress will demand of the Filipinos proof of their ability for self government. Cuba was trusted too readily and it was necessary to give a little disciplining before she learned the real lesson of self government.

SOUR LAND

Professor Cyril G. Hopkins of Illinois is now carrying the gospel of liming sour lands to the farmers of Greece. Professor Hopkins is making extensive soil experiments in all parts of Greece and has discovered large tracts abandoned because of "sour land." He also has discovered near these great stretches of ruined land large deposits of lime, and is now bringing the lime and land together and introducing the culture of melilotus to restore soils to fuller fertility. Professor Hopkins is not only giving information direct, but with assistants is giving instruction to Greek chemists and other scientists in the matter of soils and fertilizers.

SECURE THE BONUS

Many of the returning soldiers are not aware of some of the valuable services which our government is offering to render those who have spent the last year or two in training camps or overseas. For those who may be partially disabled or for any who wish to take vocational training which will give better opportunities in life, the government is providing training, including food, clothing and practically all living expenses, together with small recompense while the returned soldier is taking this course.

Other rights of soldiers as to insurance or recompense for dependents are probably well understood. There is another, however, that is not so well understood, and that is as to the bonus of $60 which has been awarded by the government. For this state there is a representative of the war department at 1660 Market Street, San Francisco who has to do with this matter of bonuses. Regarding the work of this office the department writes:

"Lieutenant Sullivan's duties will consist chiefly of certifying copies of the discharges of officers and enlisted men who are entitled to receive the $60 bonus awarded by the government. It is not necessary for the soldier to present his discharge in person; he may mail it, giving his address for the return of the original. It is advisable that the envelope be registered, and that ten cents be enclosed, that the return papers may also have the protection of registration. The same procedure may be followed by those entitled to reimbursement of mileage."

STATE FRUIT GROWERS

A half dozen associations which will meet at Riverside the week beginning May 26 have such extended programs that it is impossible to give all place in the Cultivator. An outline which gives one opportunity of choosing his favorite meeting is given on fifth page of this issue. Merely as a reminder we refer to it that fruit growers and farmers may take advantake of this great opportunity. One meeting especially which will be watched with interest is that of the entomologists who gather from California and other Western states to discuss quarantine and prevention of spreading of plant diseases. This is bringing together not only some of the biggest and brainiest of the Western members but is also bringing to the state representatives of the department of agriculture at Washington.

CULTIVATE

One still sees in an occasional orchard the winter green manure crop not fully turned under. True, there are some Washington Navel orchardists who are this year making experiments in covering soil with green growth in the hope that it may in a measure prevent the June drop. This is a comparatively new idea in citrus growing and will be given thorough test. Such growers, however, have sufficient moisture to keep both crops growing. But the orchardist who is short in any degree of water may this year find difficulty in maintaining suffient moisture to mature large crops —as a rule they will be large—and at the same time keep the trees in best condition for another year's crop.

The best conserver of the natural soil moisture is a mulch of dry dust secured by thorough and shallow cultivation or by mulch of straw or other material which keeps the sun's rays from taking too great a toll from the soil. It will be but a short time now until this toll will be heavier. Polish up the cultivator and harrow.

A JUST PEACE

Germany may well thank America for the full measure of mercy which is meted out to her in the provisions of the peace treaty, an outline of which has been given to the world during the last week. If America had not been a factor in the discussion about the peace table it is to be presumed that the peace terms would have been fully as harsh as were those for the Russians in the Brest-Litovsk treaty. Notwithstanding that at the first look at the peace terms there are many points which appear harsh toward the Germans, more careful reading with careful consideration of various acts committed during the past four years, convince every believer in justice that the German nation has not received more than it deserves. One traveler in eastern France and Belgium has referred to the conditions which he saw in traveling into Germany and said that in the two countries occupied by the Germans during the four years desolation prevailed everywhere and the faces of children were pinched and drawn from the sufferings of hunger, but the moment the Rhine was crossed even the dogs were fat.

It should not be punishment that the Allied nations are meting out so much as discouragement of future wars. It is rumored that the German delegates will refuse to sign the treaty; also that the armies of the Allies are on edge and ready for instant start for Berlin in case of refusal to sign.

CROP REPORTS CONTINUED

The issues of the Cultivator of May 3 and 10 both contained large number of expressions as to fruit crop conditions from nearly every county of the state. While there are some sections like the counties about San Francisco bay, where apricots are reported rather under normal, as a rule the indications are for fine quality.

The cool and moist weather has encouraged the ravages of fungus and some insect pests, but in the main crop conditions are fine. Oranges and lemons give promise, so far as can be given at this time of the year, of most satisfactory performance. Hay crops will run somewhat short though they will be large enough that the trade anticipates slightly reduced prices. Here are a few of the reports which had not been received at time of last issue.

Andrew Davis and Ernest Burris, West Highland, San Bernardino County

Peaches; clings, 60 per cent; frees, 45 per cent.

Pomona Contractors

Canners in Pomona sections have contracted for 7000 tons of peaches.

California Fruit Distrbutors

Here's the way it looks, but this may very materially change: Cherries, 60 to 70 per cent of a crop; peaches, full crop; apricots, 65 to 75 per cent; pears, full crop; plums, 60 to 75 per cent.

G. P. Weldon, Deputy State Horticultural Commissioner

Mr. Weldon sent earlier report, which, by an oversight was omitted last week. However, in a word: "In general, conditions throughout the state are reported very good. There has been some damage to the apricot crop in places from cold, rainy weather during the blooming season. This is also true in the case of almonds. The pear, apple, prune and peach crops, acording to present indications will be very large. Peach leaf curl has developed to a considerable extent in certain sections and, while it will not seriously decrease the yield, it will locally cause quite a bit of injury."

John A. Winkelman, Horticultural Commissioner, Eldorado County

Crop report for Eldorado County: Pears, 75 per cent of normal; apples 100; plums, 90; peaches, 100; cherries, 100.

Pears are setting rather light in the lower district but it is a bit too early yet to be able to state about the higher altitudes. Blight has made its appearance in the Coloma district and is causing enormous damage to the crop. Some varieties of plums are light, some are very heavy. Peaches look very good.

E. E. Kaufman, U. S. D. A. Bureau of Crop Estimates

Generally speaking all California fruits are in a most excellent condition. Fall and winter rains left the trees and soil in fine condition for a good set of fruit, and aside from a trifle late and below normal temperature at blossom time the outlook could hardly be improved.

Early cherries will be a light crop, but with a good late crop the production promises to be equal to or larger than in 1918.

Almonds show a full crop in some counties, but very light in others, all tending toward a larger production than last year, when any previous crop was exceeded by more than 1000 tons.

Apricots in the bay counties failed to set a good crop, owing to low temperatures and rain storms during the blossom period and will be a light crop, but in Southern California, the San Joaquin and Sacramento valleys conditions are practically normal and a production larger than in 1918 is promised, while the big crop of 1914 of more than 150,000 tons on a green basis may be surpassed.

Detailed reports on apples, peaches, pears and prunes are not made by the Bureau of Crop Estimates until June, but at the present time conditions for the above are normal or better for the state as a whole.

DR. COIT BACK TO THE UNIVERSITY

Dr. J. Eliot Coit, who has been at the head of the department of citriculture of the college of agriculture, was given leave of absence from department work and, as a war measure, a year and a half ago was made farm adviser of Los Angeles County. The classes are now returning to normal so there is demand for Dr. Coit's return to university work. He has announced that his work as farm adviser in Los Angeles County will terminate on June 1. His successor has not been named.

THE TRACTOR DEMONSTRATION

(Continued from Page 685)

Smaller tractors include the Bean, Avery and Whitney.

When one figures what these machines were doing one realizes that their field of usefulness is unlimited. In the field they pulled plows, scrapers, harrows, rakes, pulverizers, etc. In the tents they were driving grain separators, threshers, drilling machinery, cream separators, ensilage cutters and many other forms of farm machinery. And on the farm one can easily realize that they can be used in dozens of ways and that each day may show forth a new use.

The part that women are playing in tractor operation must be reckoned with as one of no mean proportions. They have shown their complete ability to handle the largest and strongest tractors. A few years ago no woman would have considered herself capable, suited or safe to drive a big Holt. This year one is being driven very skillfully and easily by Mrs. D. M. Finch of Woodland, whose husband is a Holt owner and operator. Her assistance enables him to do nearly twice the ordinary work on his hundreds of acres, and the machine gets double use, thereby giving double value.

The Yuba 40-70 was operated by Miss Lorraine Bahms, and the 12-20 by Miss Edith Brown of San Jose.

If the ladies find such complete ease in handling the larger machines how much more easily should they become masters of the smaller types! Quite likely this work will become more and more a part of their profitable sphere, for there is every reason to believe that women should profit by the healthy outdoor life that the operation of a tractor gives.

This was called a demonstration. Now what did it demonstrate? It demonstrated that plowing, harrowing disking, pulverizing, etc., are practical and economical with a tractor. It demonstrated by the attendance that the people of California are alive to the benefits of tractor farming. It demonstrated that mechanical science has taken a strong hold on the people and that the farmers of California know they can use a tractor where formerly only horses were thought available and suitable.

Not many years ago the tractor was a novelty and it had to forge a place for itself against existing prejudices. By demonstrations such as this the manufacturers have made the people know what can be done, for they have shown them the actual working of tractors under conditions that are far more severe than are likely to be found on the average farm. By catalogues, circulars, and instruction books, they have taught the science of mechanical farming, and by advertising to him through his farm paper they have shown a way to better working and living conditions.

It is estimated that between 30,000 and 40,000 people visited the demonstration last week.

Additional Tractor Displays

Farm implements that naturally go with the tractor in the field have an important part at every demonstration. This last demonstration brought out plows, large and small, disks and mould boards, light and heavy in great variety. There was an abundance of them from prominent manufacturers, chief of which were the Pacific Implement Company, the Baker, Hamilton and Pacific Company, the Oliver Chilled Plow Company and the H. C. Shaw Company. The Killefer Company of Los Angeles, exhibited the strongest plow ever made. It is used for deep plowing where the soil is particularly hard. A big 75 is required to pull it.

Hauling the Disks

All kinds of work were demonstrated. One of the newer ones. The Whitney 9-18 pulling double disks and pulverizer carrying seven foot tandem disk and seven foot pulverizer.

Aside from the plows there were rakes, harrows, graders, pulverizers in almost endless variety. The Avery Company and the Averill Company showed a full line of grain threshers.

Accessories included carburetors, magnetos, portable beds for autos, oils and greases, etc. The Hansen Machine shop in full operation was a particularly instructive section, where one could see actual cylinder grinding and boring, together with general repair work.

The Ideal Green Feed cutter, shown by the De Laval Company, of San Francisco, was operated by a belt from their Lauson tractor. This cutter makes available the use of all of the feed for cattle, thereby saving 15 per cent to 25 per cent that is ordinarily lost in feeding hay and other similar foods.

The Rotary Grain Cleaner, shown for the first time, seems to have wonderful possibilities. Aside from the excellent work it does, there are a

ESSEX MOTORS DETROIT U.S.A.

How They Praise

They Compare the New Light Weight Car to High Powered, High Priced Automobiles

Essex Performance

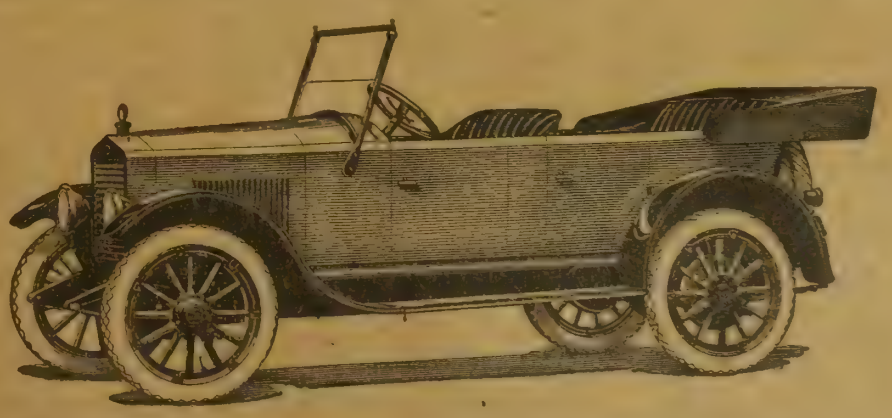
Essex performance is now talked of so generally among motorists that you should know what they are saying.

Hundreds of thousands have seen the Essex.

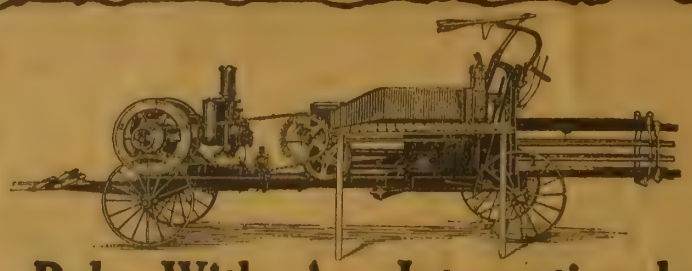
They have admired its costly car appearance. They speak of its completeness in appointment and how it differs from other light weight, moderate priced cars.

But they grow enthusiastic over Essex performance. A car at its price and of its weight was never expected to possess such hill climbing and acceleration capacity. The standard it sets has been known only in the large high priced field.

And in speed and easy riding qualities it also matches the cars which sell at two or three times its price.



You hear on every side how steadily it holds the road at speeds difficult to maintain even with some larger cars. And as for ease of riding there seems no standard known to motor cars that the Essex does not surpass.



Remember these are not our claims. They are the frank and voluntary praise of tens of thousands. You can find Essex friends wherever you go.

We advertise merely to induce you to ask about Essex and to arrange to take an early ride in it. You will surely become one of its friends. Perhaps you will want to own an Essex, and if that is so the sooner you learn to know it the better.

Sales already are far in excess of production. If you delay you might have to wait a long time to get your car.

The price is $1395 for a five passenger model at Detroit.

Bale With An International

WELL-BALED hay always commands a ready market at good prices. It requires less storage space than loose hay and maintains its quality better. It pays to own an International hay press whether you bale as a profession, side line or for your own farm use.

With any one of the International presses you can get big tonnage, neat and uniform bales, and have the satisfaction of knowing that your press is strong and dependable.

There's an International — horse, motor or power — to suit your exact needs. These presses all make smooth, neat, uniform bales — the kind that look well, sell well, handle well. They are durable, easy running, smooth running and powerful.

International service goes with the machine — a service that is always intelligently helpful and prepared to care for emergencies. See the dealer or write us for catalogues and select your International press now.

Abnormal Shedding of Young Fruits

Dr. J. Eliot Coit and Robert W. Hodgson unite in authorship of account of investigations of the abnormal shedding of young fruits of the Washington Navel orange, published as Number 11 of Volume III of University of California Publications in Agricultural Science. This is a complete and scientific statement of much of the matter which has been given out by the authors through the public press during the past two or three years. The text is made plainer by 17 full page plates and a number of text figures. A number of pages of the discussion are summarized in the following:

Citrus trees as grown in the interior valleys of the arid Southwest are subject to an environment entirely abnormal to them in their natural habitat.

Moreover, the principal variety grown in these regions, the Washington Navel orange, is itself decidedly erratic and unstable.

Among other troubles incident to the abnormal climatic conditions is that heavy dropping of the young fruits, with consequent light crops, known popularly as the June drop.

A study of the shedding has established the fact that it constitutes true abscission, involving the separation of living cells along the plane of the middle lamellae.

Exhaustive investigations as to the stimulus or stimuli responsible for the abscission have narrowed them down to two: a fungus, Alternaria citri E. and P., and climatic conditions.

It is considered highly probable that a certain varying per cent of the drop, occurring relatively late in the season, is brought about by the stimulating of this fungus, which is also responsible for a black rot of those infected fruits which remain on the trees to maturity.

This fungus is of very wide distribution and infection of the young fruits is made possible through the peculiar structure of the navel orange.

The amount of infection is dependent upon weather conditions and the more or less fortuitous configuration of the navel end of the young fruits.

On account of the peculiar manner of infection and the relatively small amount of shedding due to the fungus, spraying will probably not pay for the labor and materials involved.

By far the greater part of the shedding, which occurs earlier in the season, is due to a stimulus to abscission arising from daily water deficits in the young developing fruits, resulting from the asperity of the climatic complex to which the trees are subject.

The principal factor in causing these abnormal water deficits lies in the fact that citrus trees are not adapted to withstanding the heavy water loss incident to the desert conditions under which they are grown.

The ampliture of stomatal movement is small and cuticular transpiration very high.

It is further believed that under the prevalent clean cultivation practice, the soil temperatures during a part of the day are so high as to result in the inhibition of absorption at the very time of day that water loss by transpiration is greatest.

It has been found possible to modify climatic conditions in an orchard so as to set crops in every way comparable with those produced in much more climatically favored citrus districts.

Under these modified climatic conditions the abnormal water relations referred to apparently do not occur.

Practical means of amelioration lie in heavier and more frequent irrigation, the planting of intercrops, mulching with straw and other materials, protection by means of windbreaks, and a reduction of leaf area by moderate winter pruning.

Measures of an anticipatory nature lie in the judicious selection of the site for the orchard with reference to its exposure, nearness to large irrigated bodies of land, and other features calculated to ameliorate climatic conditions.

Orchardists should be on the lookout for mutant strains which are dry heat desistant and satisfactory in other features.

CITRUS INSTITUTE ORGANIZED

Dr. H. J. Webber, director of the state citrus experiment station at Riverside, has been named president of the California Citrus Institute to be held annually in San Bernardino in connection with the National Orange Show. Permanent organization of the Institute was effected at a meeting of the committeemen held in San Bernardino, the committee having been named at the institute held last February.

Other officers named: Vice president; R. O. Price of Upland; secretary, F. M. Renfro of San Bernardino; treasurer, W. H. Fleet of Sespe. Membership committee: W. H. Fleet of Sespe, J. G. McBeth of Riverside, C. N. Norton of Pomona.

By-laws were adopted tentatively until the next institute in February, 1920.

CAPRI FIGS IN DEMAND

J. C. Forkner, a fig grower of Fresno, is making a canvass of the fig growing sections of the state, searching out any possible capri fig trees. The growing of Calimyrna, or the true Smyrna, figs has increased during the past few years and there is need for more of the capri trees which produce the fig which shelters the blastophaga and makes it ready for fertilization of the flowers of the Smyrna fig. Mr. Forkner writes of several of these trees which have been discovered, the value of which has not been known to the owners, the trees occupying neglected ground. It is probable that during the next two months there will be market for every one of these capri figs which have been occupied by the blastophaga.

FARMERS SHORT COURSES

The University of California announces Farmers' Short Courses under direction of the college of agriculture, to be held at University Farm, Davis, September-December. So far as announced the following are the dates:

September 16-25, gas tractors; September 29-November 7, general agriculture, including animal industry, poultry industry, dairy manufactures; November 10-22, butter making, bee keeping; December 1-13, cheese making; December 8-20, deciduous fruits.

SAVE THE PRUNES

Professor W. V. Cruess of the college of agriculture estimates that a great part of the $5,000,000 loss suffered by prune growers because of the rains of last fall could have been saved by a series of evaporators. The University of California has issued a bulletin entitled, "Salvaging Rain Damaged Prunes," in which Professor Cruess outlines methods.

No Belts—No Suspenders

LEE UNION-ALLS are all in one piece—so easy and comfortable you'll be glad you own a suit every time you put it on. Remember too that LEE UNION-ALLS cover your body from head to foot, protecting your skin from dirt, grime and chaff. Superior quality features make LEE UNION-ALLS the most economical work garments manufactured. All seams are triple-stitched, all strain points are reinforced; buttons are riveted to the cloth; button holes are rip and ravel proof. Many other features insuring long, satisfactory wear. If your dealer does not handle LEE UNION-ALLS, write for further information and tell us his name.

TiziT TiziT

TIZIT SPRAY

A Tried and Proven Insecticide and Fungicide for Citrus Fruit Trees

"Am I going to spray with Tizit again this year?"

"I surely am. Why man! after I get Tizit on my trees I don't have to worry about them the rest of the year. The spider won't bother them, and the fruit stays on the trees like it was glued, and where I used to have dirty, smutty fruit, I now have a better grade of good clean fruit that pays me lots more money."

"Yes, I'll spray again in a couple of weeks."

The above conversation took place between Mr. J. D. Enyart, Manager of the White Rose Ranch of Montebello and Mr. Wyllie of the Tizit Spray Company.

Mr. Enyart got acquainted with Tizit five years ago, and it has proved the best friend he ever had.

Make a Friend of TiziT

—Tizit Spray will clean your trees of moss and lichen, also the exudation of the Black Scale that coats the foliage and fruit, leaving the trees and fruit perfectly clean.
—Trees sprayed with Tizit have proven immune to Red Spider.
—For the eradication of Black Scale, Citricola Scale and other soft scale Tizit has no equal.
—Tizit contains no oil or other material that will damage trees.

Get our proposition and the testimonials of growers who have ceased to worry about insect pests and fungus troubles since they commenced using Tizit Spray.

Write today for Price List and testimonials or ask our representative to call on you.

Asparagus Production in California

By R. G. Risser, Federal Truck Crop Specialist

ASPARAGUS production as conducted in California is in certain respects typical of farming as practiced in this state. It is a highly specialized business, is carried on by a system of agriculture which is both intensive and extensive, and is mostly concentrated in restricted districts. The localized nature of asparagus production is indeed recognized both in California and in the United States as a whole. When the last census was taken 75 per cent of the country's acreage was located in seven states, California had the most extensive area and in all probability it still holds the first place in asparagus acreage, as the area has been practically doubled since the census was made. About 90 per cent of the asparagus acreage of California is located in the rich sediment and peaty lands of the delta of the Sacramento and San Joaquin rivers. These reclaimed districts of Central California have proved to be well adapted to the cultivation of this crop. It is here in Sacramento, Contra Costa, Solano, San Joaquin and nearby counties, that the earliest large asparagus shipping business in the United States and the major portion of America's asparagus canning industry is located. The asparagus as grown in the delta is not only the most important perennial vegetable grown in the state, but in point of acreage is the most extensively grown truck crop produced in a limited district, except potatoes. At existing contract prices it should bring the growers and landowners of this section a gross return this season of close to $2,500,000. Aside from the river district of Central California, Imperial Valley of Southern California is the location of another important shipping district, and incidental plantings are distributed through several counties.

Asparagus production affords an excellent illustration of the extension of truck crop acreages. When the census was taken in 1899 there were 2368 acres of asparagus in California and 10,184 acres in the United States. When the next census was taken in 1909 there were 9399 acres of asparagus in California, or almost as much land devoted to this crop in this one state as there was in the entire United States ten years previous. Since then the rapid growth of the industry has continued, indicating that a proportionate extension of the area has occurred. During the past two years, however, the asparagus industry in California has passed through a critical period of its history. There has been serious difficulty in providing labor; the cost of production and handling has greatly advanced, material losses of the produce have been sustained, particularly during the rush periods, and the development of the crop has been too late to provide supplies adequate for successful shipping seasons. Yet in spite of these severe drawbacks the area of new plantings which were made the past year was almost twice as large as the area of old fields which were plowed up and more planting is being made this year. The largest increase in acreage is in Solano County.

As the past two seasons have not been normal ones, it is necessary to go back for the past four years to convey a fair idea of the usual production. From records obtained from many sources and checked as closely as possible, the following estimate of production has been computed:

	Canning, lbs.	Shipment and Local, lbs.	Total lbs.
1915	38,873,280	17,268,500	56,141,780
1916	47,555,520	20,068,500	67,624,020
1917	57,444,576	15,600,000	73,044,576
1918	41,998,650	14,147,500	56,146,150

The first column refers to the product which is consumed in the preserved state, and the second refers to the product which is consumed in the fresh state.

The production in Imperial Valley in 1917 was 688,125 pounds; 1918, 566,125 pounds. The crop produced in this district is not canned.

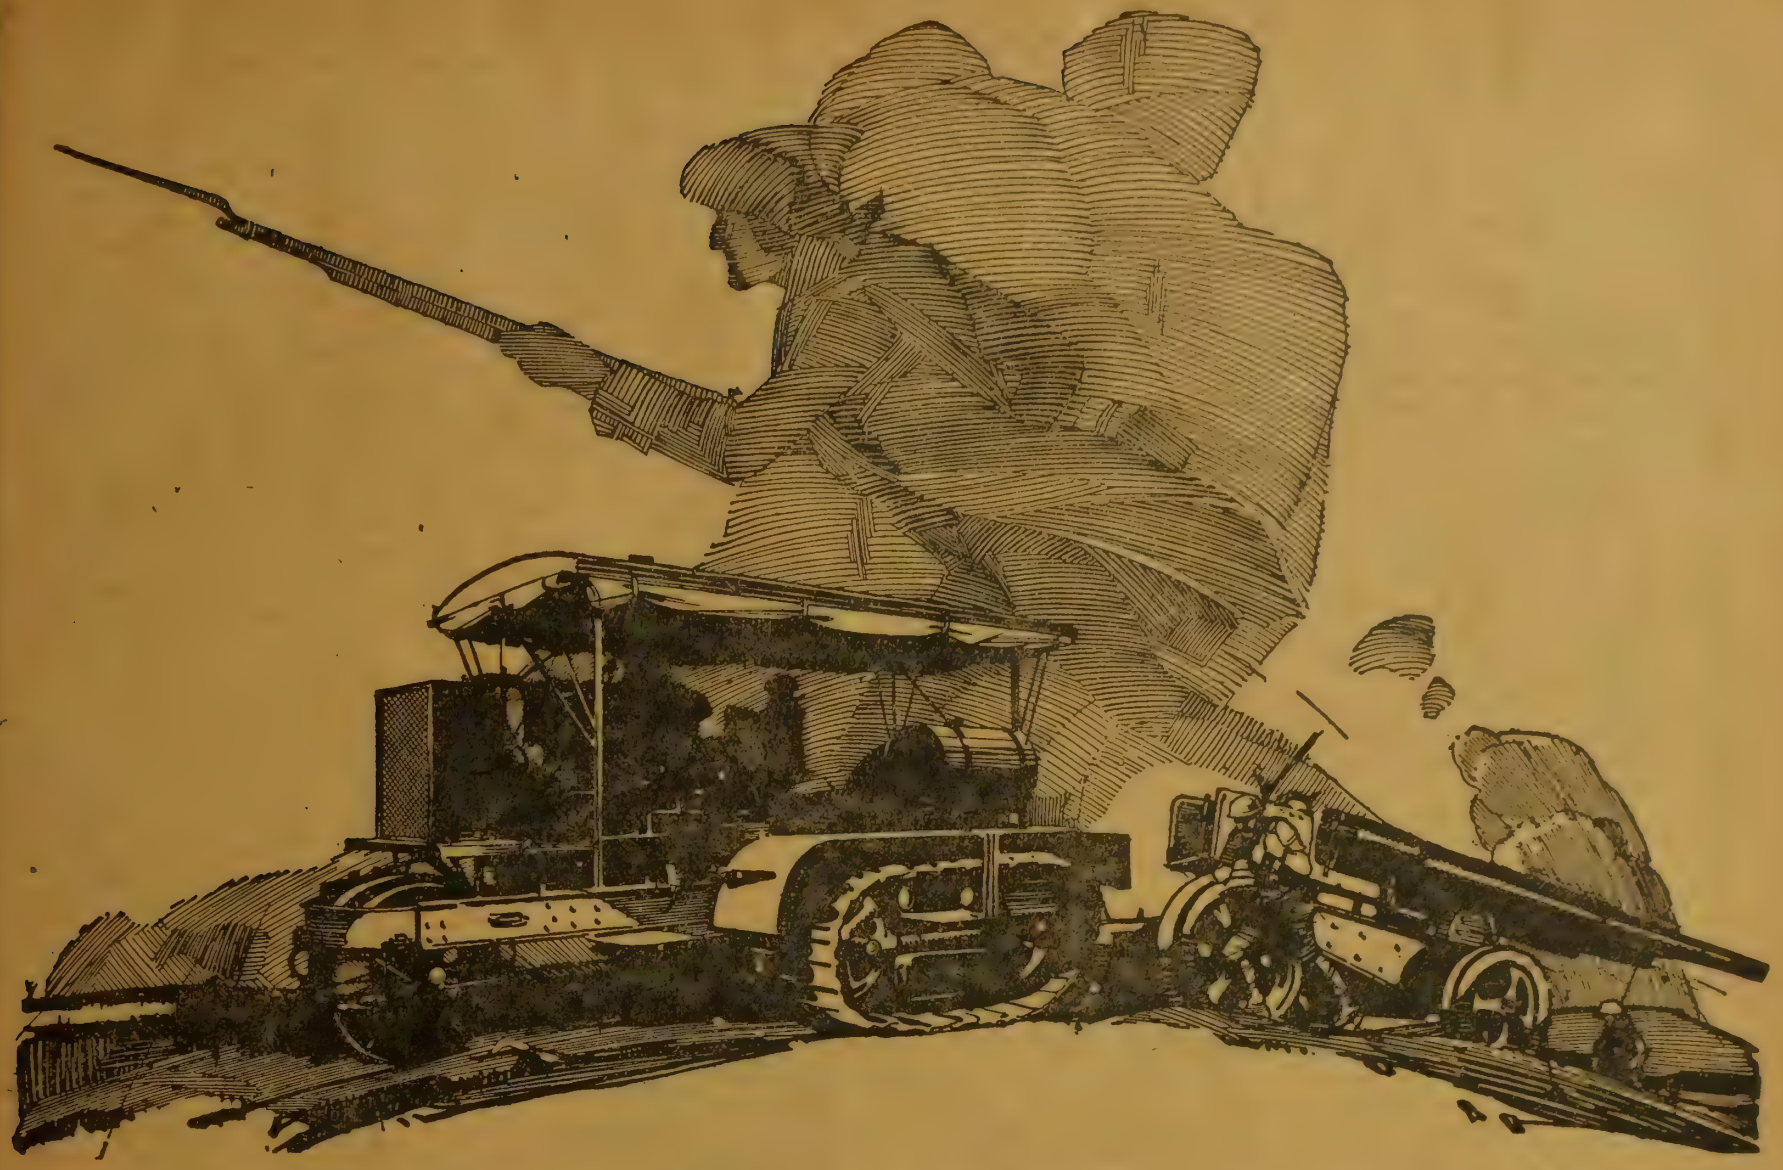
Preventing Bees From Swarming

IN reply to a request for information as to the cause of excessive swarming of bees and the way to remedy it the following suggestions were recently furnished by letter to the inquirer, by Dr. Charles T. Vorhies, entomologist, University of Arizona:

Unfortunately the problem of bees swarming is one which cannot be met by any one remedy in all cases. Bees swarm for a variety of reasons, and consequently a number of possible deterrent measures should be known to the bee keeper, one or more of which he must select according to the probable conditions which lead to the trouble in his case. I will attempt to post briefly for you the several means which are used.

Swarming often seems to result from crowding, and the remedy is to provide more space. A general change to larger hives in a whole apiary may sometimes be desirable, but a particular hive may be enlarged at the time a remedy is needed by the addition of supers, or even by the addition of a second hive body on top of the original, and this latter may even be allowed to become a second brood chamber. That extracted honey producers have almost no trouble from swarming is due to the additional space provided by the large supers of foundation or empty comb on which the bees can work.

Too warm a hive may lead to swarming. Hives should be in fairly well shaded locations, and good ventilation should be insured if bees are seen to hang on the outside of the hive in masses, by giving a large entrance opening. The hive may even be raised in hot weather by placing a small block under each corner, permitting ventilation and entrance on all sides of the hive. Masses of bees hanging on the outside of the hive do not always indicate that swarming is about to occur.



Clipping the wings of the queen some time before the swarming season is often resorted to, but does not always prevent swarming. However, the swarm cannot get away if this has been done, and the queen can be picked up from in front of the hive and placed in a new hive on the old location.

Inspecting the hives every eight days and killing the eggs or young found in queen cells is often, but not always, a successful preventive of swarming.

It seems to be pretty well agreed, that swarming is more likely to occur from hives having old queens than from hives having young queens. Therefore requeening with young queens is frequently a successful remedy.

Caging the queen or removing her for a period of ten days is another method used to prevent swarming. In case this is done the queen cells which the bees will at once produce must be sought and destroyed at the end of eight or nine days.

Removal of some of the brood and its replacement with frames of foundation or empty comb, or, what amounts to the same thing carried further, removal of the colony to another hive when it is preparing to swarm, is still another method. The latter may be done all at one time by placing a new hive containing frames of foundation or empty comb in the old location, removing the old one to one side, and shaking the bees down in front of the new hive. When the brood has hatched in the old hive it

The Farmer of '17 and the Farmer of '76

Each went to war in defense of his country and of the ideals which he held dear.

The farmer of Revolutionary Days beat his plow share into a sword with which to carve out a free America.

The modern farmer performed a similar and an even more important service, for by patriotically yielding to the priority of Government orders which limited the output of the Holt factories available for domestic delivery, he contributed one of the greatest mechanical agents of the war—the "Caterpillar" Tractor.

Through the genius of the military experts of this country and its Allies, this *peace-time* machine, designed to till the soil of a million farms, was adopted for the most strenuous *war-time* uses.

Adopted in armored form as the mighty armored "Tank," which is conceded to have saved 20,000 lives on the Somme in the Fall of 1916 alone.

Adopted as the standard heavy hauling machine by America and its Allies, being used to move guns and caissons and supply trains, making sure that no matter how fast the dough-boys might move, or how muddy or rough the terrain might be, their artillery would be right behind them, ready to lay a protecting barrage at a moment's notice.

Of course, only the "Caterpillar" Tractor would do for the armies' most strenuous work. That is why, when The Holt Manufacturing Company in 1914 put its facilities at the disposal of the Allies, the English and French took practically the entire output of its eastern factory. And that is also why the U. S. Ordnance Department, when it launched the most complete motorization plan the world had ever known, after severe tests adopted "Caterpillar" Tractors exclusively for all the heaviest and most severe work, taking not only the output of the Holt eastern factory, but also engaging scores of other eastern factories on the production of Holt tractors, assemblies and parts.

But at last the stress of war is ended and Holt factories are again on a pre-war basis, strengthened by their war-time service and experience, now again making immediate delivery of "Caterpillar" Tractors and parts.

The same efficiency of principle; the same rugged construction; the same self-track-laying design, turning engine power into draw-bar power with a minimum mechanical loss—all the qualities which won the "Caterpillar" Tractor honor upon the battle-fields of Europe—are at the disposal of American Agriculture as in the days before the war.

Reconstruction time should be tractor time. Write today for full information regarding the "Caterpillar" Tractor. Ask for Catalog 401.

"Caterpillar" Tractors—built only by Holt or under Holt contracts and patents—the only track type of tractor adopted, after rigid tests, for the severe war service of America, England and France.

is added by shaking to the new one. This change may be accomplished in two operations by removing half of the brood frames from the hive and replacing them with empty comb or foundation frames, after which the bees are shaken from the removed frames in front of the hive entrance. After work has been well started on the newly added frames replace the remaining half of the old brood frames in the same way. Give the frames of beeless brood to colonies that can use them.

Remember that there is no single infallible remedy, and select the remedy or remedies that judgment dictates as most likely to meet the conditions in a particular case.

Do not permit excessive swarming in any case if a profitable honey crop is expected, and try to prevent any swarming whatsoever. A larger number of colonies is really needed in the apiary.

State Engineer Thomas Maddox of Arizona, states that the federal appropriation for good roads is based largely on the 1910 census which gives Arizona 204,354 population, while the soldiers were furnished on an estimated basis of a population of 409,203. He has asked the Arizona delegation in Congress for legislation which will give the state a larger portion of the road funds.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Turks Dying

Am losing lots of my young turkeys. They seem to have no get up, droop around and finally die. I feed clabbered milk, young onion tops and crumbs. They have plenty of range in 40 acre peach orchard, plenty of good drinking water. I keep housing quarters clean and in first class shape. Is there anything I can do to remedy present conditions?—Subscriber, Delano.

It is possible your turkeys are lousy. Have you dusted their heads and under their wings with buhach powder? If not, that is the first thing to do. Dust them well and dust the hen also. Lice are deadly foes of young turkeys. If there are no lice we must conclude that the turkeys are dying of blackhead, though you do not mention diarrhoea, which is nearly always a symptom of this disease. In that case the only thing to do is to feed less. Your ration is all right, except that bread crumbs are not as safe feed as rolled oats. If your turkeys have good range they need very little besides. It would be a good plan to feed nothing but cottage cheese in addition to the greens they get on range until you are sure they are all right. Most little turkeys die from overfeeding, and once they are sick there is no cure.—J. A. K.

Incubation at Fault

What is the matter with my little chicks? They are dying very fast and not two weeks old? They become pasted up with a substance that was of a creamy color. I washed them off with warm water with lysol in it, but they eventually died; they had buttermilk and sour milk to drink, so it does not seem that it could be white diarrhoea. There are others with no signs of any discharge. They stand with their wings out like a fly, eat little, drink little, do not move much, some times they live several days, some times only a few hours. The brooder house is new on new ground. The hatch was a poor one; one incubator began to hatch between the eighteenth and nineteenth days and all were out by the twentieth. The other one did not begin until the twentieth day. Only ten per cent eggs were unfertile, but many died in the shell. My hens are three years old, some of the roosters also, others are young. Out of 100 eggs only 49 chicks came out. Some of them were weak and crippled. Incubators had not been used for two years, but there were no weak or sickly ones in the last batch before they were put up for the season.—Subscriber, Dos Palos.

A positive diagnosis of white diarrhoea can be made only by a careful bacteriological examination of a dead chick. If they continue to die it might be well to send one to Agricultural Experiment Station, Berkeley, and ask for an examination. Meantime continue the buttermilk diet and remove sick chicks as soon as they show signs of the disease. There was evidently something wrong with the incubation of these chicks, and that may be at the bottom of the trouble. The fact that there were cripples shows that the temperature ran too high at some time during the hatch. If the incubator had not been used for two years how do you know the thermometer was accurate? If it was just a little out it might easily have spoiled the hatch. Any druggist will test your thermometer. It is possible, too, that your brooder does not keep the chicks warm enough or that you have been running the temperature too low. Forty chicks in a 100-chick brooder need a higher temperature than 100 chicks would. The only test is, are the chicks comfortable? Do they lie comfortably around on the brooder floor, or do they huddle and peep? If they do not act comfortable, give them more heat.—J. A. K.

Smut

Herewith twigs covered with smut or sooty appearing deposit. What is it, and what will cure it?—Subscriber.

This smutty deposit, or rather growth on trees and plants, is an indication of insect infestation. There are many insects which induce the growth of this fungous trouble, and the remedy is to spray or fumigate so as to remove the insects. The most common of these are the black scale, aphis and mealy bug, and there are many others. Hence the remedy has to be fitted to the particular insect which causes the trouble. Presumably the trouble in this case was the aphis because the twigs indicate no infestation with scale. These twigs were sent to Professor H. S. Fawcett, and he says: "I think you are correct in assuming that the twig contains the ordinary black sooty mold which usually follows or accompanies the presence of some of the honey dew secreting insects."

Growing Orange Nursery

I would like to have some advice on the care of young orange trees. I planted a nursery this spring and they are just budding out. Some of them appeared to have dried up after transplanting but are now shooting out from the bottom. Should I cut off the dried tops? When can I expect to bud? Can you tell me the name of a book that will give general information for a beginner?—Subscriber, Porterville.

The most complete nursery book we know of is "The Nursery Book" a complete guide to the multiplication of plants, written by Professor L. H. Bailey and published by the Macmillans of New York, at $1.50 net. This, however, is not written from a California standpoint although there are several pages given to citrus fruits, stocks for, and to other phases of orange tree production, but the book is most complete as to the general nursery practice. As to the specific questions above these plants should be given sufficient cultivation and fertilizer to push out good vigorous growth, and if the top is dying back as suggested then choose one of the more vigorous shoots which will come out near the base of the plant and encourage its growth until the fall of the year when fall or dormant budding may be practiced. The more sucessful buds, however, are produced by the spring buds which should be set in March or May of next spring.

Black Scale

I would like to ask about black scale on orange trees. My three and four year old trees are showing it for the first time. Is there any spray that

will kill it?—Subscriber, Long Beach

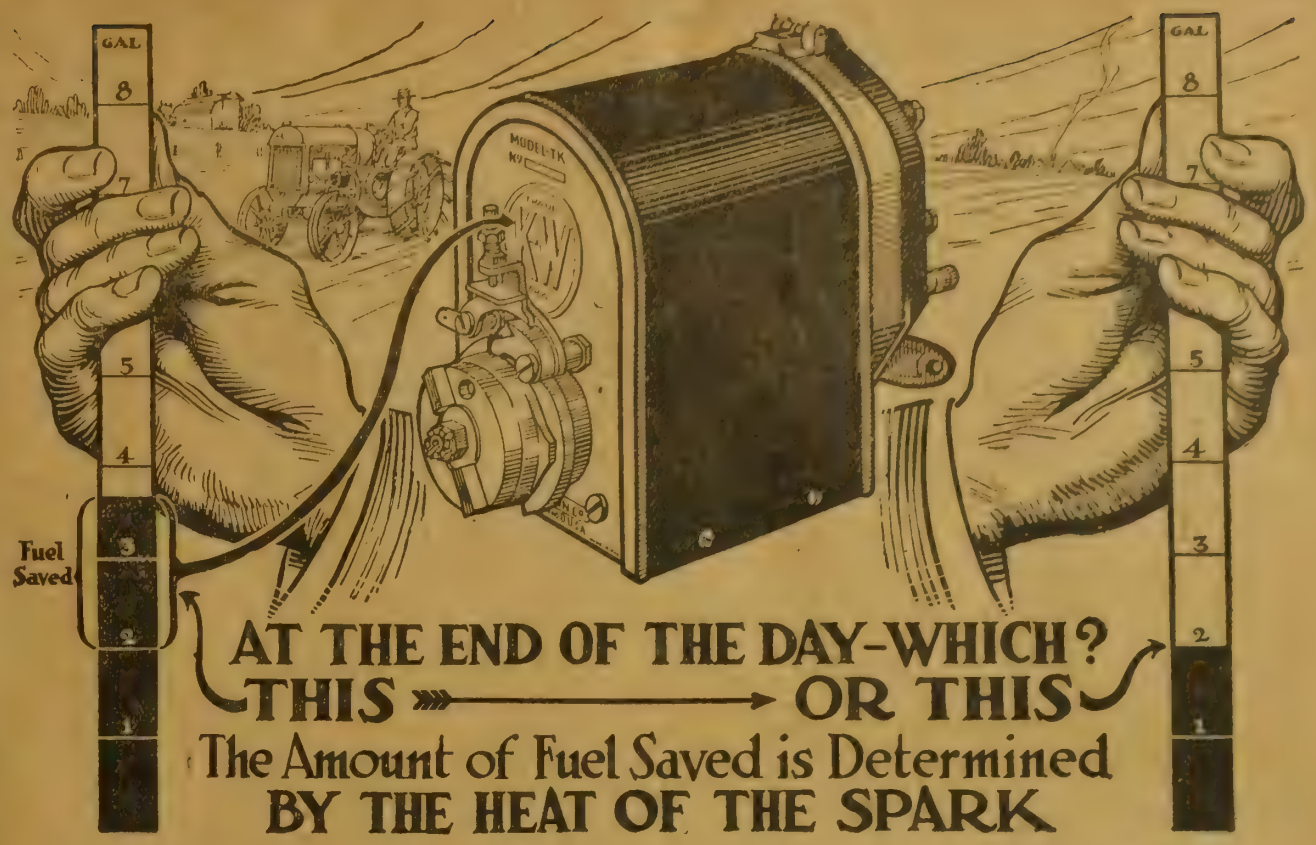
At one time growers worried somewhat over the black scale. It is found to be very easily controlled, however, the best method being through the use of the fumigation tent. If there is no outfit near you however, the best way would probably be to spray with kerosene emulsion or other contact insecticide. These may be had of any seed and plant house with information as to proportion to mix with water. It would perhaps be well not to spray these trees, however, until later in the summer as results from spraying on blossoms or recently set fruit might not be favorable to a big crop this year.

Peach Leaf Curl

I have a number of three-year-old seedling peach trees, and this year six of them are affected with a leaf disease; the leaves thicken and turn red and curl up. What is the remedy? Is it too late to spray?—Subscriber.

We have never observed the ill effect of peach leaf curl to the extent which has been shown this season. It now appears that some vigorous trees will be killed or at least seriously injured by this trouble. This pest has been a serious one for many years and nearly a score of years ago Professor Pierce of the United States department of agriculture, and at that time in charge of the Pacific Coast laboratories located at Santa Ana, issued as a regular department publication, "Peach Leaf Curl: Its Nature and Treatment." This is a 204 page book fully illustrated and discussing from all angles this pest of peach orchards. We presume this book is out of print but if the department still has copies subscribers whose orchards are infested and would like to have this information may secure it by writing to Secretary, United States Department of Agriculture, Washington, D. C. Meantime regarding treatment: It is too late to secure effective results. It should be treated before blossoming time by spraying with a strong Bordeaux mixture. A lime-sulphur wash is also excellent, but we believe according to Professor Pierce and other investigators that the Bordeaux shows somewhat better results. The only thing to do now is to spray with weak Bordeaux mixture; two pounds of copper sulphate, three pounds of lime and 50 gallons of water. The above will answer also nearly a dozen other inquirers who have written and sent leaves showing this disease.

Apple Blight



I have some apple trees on my place that look sickly and some of the limbs are dying. I sprayed them when I sprayed my peach trees. What is the best spray for apple blight?—Subscriber.

There is no spray that will control the apple or pear blight. The only method of controlling this pest is to cut as fast as it appears, removing all dead branches and even the young growth as the blackening leaves indicate the presence of the blight. The tools used in the pruning should be dipped each time a cut is made in formaldehyde or bichloride of mercury solution.

Fertilizer for Roses

I have a number of very large rose bushes, such as General McArthur, Chatenay, Cochets, White American Beauty, etc. They are eight or more years old. Ground always kept in good condition, but practically no fertilizer. What commercial fertilizer is best for them during summer? How applied? How much?—Subscriber, Long Beach.

Poultry manure would perhaps be the best application around these roses. Also use lawn clippings, leaves or other vegetables which will dry on the ground. For commercial fertilizer we assume there are only a few bushes to be fertilized. Any seed house can supply complete fertilizer in small packages. Any "complete" fertilizer would answer the purpose or in the Long Beach section if fertilizer is wanted in large quantities we doubt not bone meal and dried blood can be secured. Apply, say, a pound or a pound and a half of bone meal and a half pound of dried blood, to each bush. Near ocean sections often find value in sea weeds.

The measuring stick tells its own story. Many tractor owners have found a big saving in fuel bills after changing to a K-W High Tension Magneto, due to the hot, fat, intense spark a K-W develops at all speeds. **Your** cost to plow, fit the seed bed and seed one acre depends to a great extent upon the heat of your spark.

Why a Hot Spark SAVES Fuel

Greatest power is obtained from your engine when the hot, intense spark fires the mixture rapidly—that is, when complete combustion takes place in the **shortest time.** Rapid expansion of vaporized fuel develops maximum power at the piston—slow expansion reduces the power at the piston. **Engineers know that the hotter the spark, the more rapid the combustion.**

You can readily see that when combustion takes place the piston is traveling **away** from the driving force of the gas and that the quicker the combustion, the quicker the energy is liberated and greater is the power delivered to the piston, because the full force acts before the piston can get away from it.

The K-W Gives the Hottest Spark Known

As a result owners of K-W equipped tractors can fire leaner mixtures and still get full power from their engines which means a **material reduction in fuel bills.** They are also able to fire the lower and cheaper grades of fuel because a K-W magneto fires all fuels;—and more, it gets maximum power out of every drop used, regardless of how slow or fast the engine runs.

Turn ordinarily wasted fuel into useful work by making sure the tractor you buy is K-W equipped. Look for the K-W Trade Mark. Write today for a list of K-W equipped tractors and free illustrated booklet, "Plow This Additional Acreage Without Fuel Cost." If your present tractor is **not** K-W equipped and you want to plow additional acreage without fuel cost, write us,—a K-W Magneto will do this.

How Union Stock Yards Would Help

FROM time to time the Cultivator has published articles urging that a more modern and efficient plan of marketing live stock is needed by California producers, and we have declared for a properly regulated union stock yard located at the two principal killing centers, San Francisco and Los Angeles.

We are just in receipt of a letter from one of our readers stating that he does not agree that a union stock yard would result in any improvement over existing conditions, but adds that he is open to conviction and would like to have pointed out some specific benefits accruing from such a plan of selling.

Without attempting to point out all the benefits resulting from a more modern plan of selling, we will enumerate a few of the more important improvements that can be expected:

An open market.

Competitive buying.

A graded market based on quality and finish.

Reliable market quotations and reports.

Stabilization of live stock loans.

Development of feeder and stock trade.

An open market is the most vital and fundamental need confronting California live stock producers. Under existing conditions producers in the state are denied such a market. Practically, there are three methods of selling live stock in vogue in California. The producer can ship direct to the killer, standing the heavy shrink and taking whatever price he can get; he can sell to the country representative of the killer who offers him the best price either for immediate or future shipment; or he can sell to the speculator who offers him the best price, and who in turn will drive a deal with the killer.

At first glance it would seem that such methods of selling would be satisfactory—that the stock owner can bide his time at his own ranch and wait the coming of the different buyers who will bid against each other and that he can close with the man offering him the best deal—and do all this business right at home—unless he elects to ship direct. As a matter of fact the system doesn't work quite so smoothly. The buyer has every advantage. He knows the market; the supply and demand; the comparative quality of one lot of stuff with the general average, and usually the financial and feed resources of the seller. Naturally he takes advantage of this information. It may happen that he will delay making an offer until financial and feed conditions force the seller's hand. But the other buyers,—what of them? Country buyers have a happy way of keeping off each others "reservation".

If the seller refuses all home offers and decides to ship direct, what is he up against? Just this: He ships direct to a killer without knowing the ruling market quotations. His stuff is unloaded at the private yard of the packer, miles from home, and with a freight bill on them. The stuff may or may not be sorted. An offer is made. If unsatisfactory, the seller can hardly reload and ship home, nor can he take his stuff to another buyer. He takes what is offered. The stuff is driven over the packer's own scales without a fill.

The statement was just made that the seller shipped without possessing a knowledge of prevailing market quotations. To many that statement may sound strange in view of the fact that San Francisco and Los Angeles papers carry a daily live stock market report. These alleged reports mean little or nothing as compared to the market reports issued on Eastern markets. Eastern market reports are compiled from actual transactions whereas Coast reports, aside from Portland, are furnished by individual firms and are in no way representative or indicative of actual sales.

During the recent meeting of the California Cattlemen's Association and the California Swine Breeders' Association a representative of the bureau of markets of the United States department of agriculture was present and when asked if the bureau planned to issue a San Francisco report, frankly stated that it was impossible to issue a reliable report for California markets inasmuch as there was no way of ascertaining the actual prices paid. A prominent packer who was present admitted as much.

Another intolerable condition prevailing on California markets is the practice of selling live stock without efficient grading. For instance, take a representative California market report. It reads about as follows:

Good steers, 12.00@12.50; medium steers, 11.00@11.50; common steers, 9.00@10.00; good cows, 10.00@10.50; medium cows, 8.00@9.00; common cows, 6.00@7.00; No. 1 hogs, 175-225 pounds, 18.50@19.00; No. 2 hogs, 250-400 pounds, 17.00@17.50; feeder hogs, 13.00@14.00; spring lambs, each, 7.00@8.00; regular lambs, cwt., 15.00@16.00; regular lambs, No. 2, cwt., 14.00@15.00; wethers, No. 1, cwt., 11.00@12.00; wethers, No 2, cwt., 7.50@9.50.

Another report reads:

Cattle — Grass fed, on foot, gross weight, No. 1 steers, weighing 1000 to 1200 pounds alive, 12@12½; 1200 to 1400 pounds, 12@12½; second quality, 11@11½; thin steers, 9@10.

Cows and heifers—No. 1, 9½@10; second quality, 8½@9; common to thin, 4@7.

Calves — Light weight, per pound, 11½@12½; medium, 10½@11½; heavy, 8@10.

Sheep—Pound, gross weight: Wethers, unshorn, 11@11½; ewes, unshorn, 8½@9½; lambs, yearlings, 12@12½; milk, 13@15.

Hogs—Hard grain fed, weighing 100 to 150 pounds, 18½; 150 to 250 pounds, 19; 250 to 300 pounds, 18½; 300 to 400 pounds, 18.

Still another reads:

Quote the following prices for live stock delivered and weighed off cars at their plant in San Francisco: Steers: Choice, 1050 to 1200 pounds, 12½@13; medium to good, 950 to 1050 pounds, 12@12½; good grass steers, 1000 to 1200 pounds, 12@12½; other steers, 950 and over, 11@12. Cows, 1000 pounds and up, 10@10½; medium to good cows, 9@10; canners, 5@6.

Hogs—Hard grain fed, well finished, 175 to 250 pounds, 19¼; 150 to 175 pounds, 18½; under 150 pounds, 17¾; 250 to 300 pounds, 18½; 300 pounds and up, 18.

Confusing to say the least and not at all uniform in range or grade.

One firm quotes "No. 1" steers, subgraded 1000-1200 pounds; 1200-1400 pounds; "second quality"; and "thin steers". Another firm quotes "choice" steers; "medium to good"; "good grass steers" and "other steers 950 pounds and up". A third quotation grades "good", "medium" and "common".

A typical Eastern market report is based on actual sales and established and uniform grades, as follows:

Steers: Choice to prime heavy, 19.50@20.25; medium to good heavy, 18.00@19.50; choice to prime handyweights, 19.00@20.00; good to choice handyweights, 17.75@19.00; fair to good shortfeds, 14.75@16.75; common to fair steers, 12.00@14.75; light stockery steers, 9.00@11.00; good to choice yearlings, 16.50@18.75; medium to good yearlings, 14.50@16.50; common to medium yearlings, 11.50@14.50.

Butcher cattle: Choice to prime cows, 13.25@15.75; fair to choice cows, 10.00@13.25; cutter and plain butcher cows, 7.25@950; canner cows, 6.50@6.85; good to prime heifers, 13.50@16.00; inferior to good heifers, 10.00@13.50; good to prime fat bulls, 10.50@14.00; common and bologna bulls, 9.50@10.25; fair to best veal calves, 14.00@14.50; heavy and medium calves, 9.00@13.00.

Hogs: Bulk of sales, 20.75@21.00; light butchers, 20.80@21.10; heavy butchers, 20.95@21.10; choice light bacons, 20.65@20.95; choice to good mixed, 20.70@20.90; heavy mixed packing, 20.65@20.85; rough heavy packing, 19.75@20.25; good to choice pigs, 17.00@19.20; boars, 13.00@14.50; stags, 18.00@19.00.

Sheep: Good to choice lambs, 19.00@19.65; fair to good lambs, 18.50@19.00; common to fair lambs, 16.75@17.75; good to choice yearlings, 16.75@17.75; fair to good yearlings, 15.50@16.75; good to choice wethers, 16.00@16.50; fair to good wethers, 15.00@16.00; good to choice ewes, 15.00@15.50; fair to good ewes, 11.75@15.00; rams, 10.00@12.00.

Aside from the fact that better bred

stock can be marketed at a younger age and scaling more pounds than common stuff, there is scarce reason for California stock men to institute a systematic plan of stock improvement until our markets recognize the fact that better bred animals are worth more than trash, even at the same weight. From California quotations could one infer that a thin steer weighing 1200 pounds, and a fat steer weighing 1200 pounds would be classed as "No. 1" and sell for the same price per pound?

Contrast the above plan of selling with the system developed in other sections. An Eastern producer knows that the daily market reports are reliable. With this knowledge in hand he has two methods of marketing. He can sell to a country buyer (and country buyers in the East buy on a more "human" margin than California buyers) or, if he has a carload he ships direct to his nearest market with the full knowledge that the market can absorb his stuff. Of course gluts develop in the East from time to time, and the price is often affected. But to proceed — this stuff is loaded, the owner may or may not accompany the shipment. In either case it is consigned to a commission firm. These commission firms maintain an expert corps of salesmen and buyers—men who are in daily touch with the market, who know the various classes of live stock and what each grade is worth.

The stock arrives at the yards and complete charge is assumed by the commission firm. It is unloaded, watered and fed. If it is a mixed lot the agent knows just how to sort to best advantage. He gets in touch with the various buyers and drives the very best deal possible for his customer. There is keen competition among commission firms for business and consequently it is their interest to get every nickel a shipment is worth. A nominal charge is made for the services rendered, and a complete and detailed financial statement of the deal, together with the check is forwarded to the consignor.

The advantages of such a system over the California plan must be obvious. First the producer is assured a market at which all killers are represented; a market based on established and uniform grades and through the commission firms he has the advantage of expert salesmanship by men who are as familiar with every angle of the live stock market as the packer-buyer. Under the established system of the Eastern markets the the shipper has another important advantage over a shipper to either San Francisco or Los Angeles, this advantage is the practice of selling after the shipment has been watered and fed—given a "fill". The argument used against the practice of filling claims that the advantage of a fill is overestimated because the buyer always takes into consideration the amount of fill before making his offer, and that the price is made according- [illegible] Regardless of the merits of such a practice, the fact remains that the fill widens the margin between Eastern markets and Coast quotations. When it is pointed out that Eastern quotations are on a filled basis and Coast prices on an unfilled basis it is clear that there exists a wider margin than first appears. A 20 cent hog at Chicago and a 19 cent porker at San Francisco hides more than a cent difference. The same is true of cattle and sheep.

Union stockyards serve to develop other phases of the live stock industry than simply affording a meeting place for producer and packer. Because of the open nature of the market and the established grades a general buy-and-sell business is developed. Stuff of various grades of quality, particularly cattle and sheep, not meeting with a ready demand from packers are classed as "feeders" or "stockers" as the case might be, and men who make a business of feeding out unfinished stuff, men who are long on feed and men who want to stock their places can come on to the market and bid for such stuff as meets their requirements.

Is such a business carried on out here? No. The only way the speculator can operate is to go to the country, and not many are following such a plan. Once the stuff is unloaded in any packer's yard in either San Francisco or Los Angeles no one else sees it. The speculative element around a union yard forces the packer to pay full value.

There is no denying the fact that occasionally certain abuses have developed in Eastern markets through the fact that the yards are under packer control, but for the most part the system is by far the most efficient and satisfactory yet worked out. What the Cultivator hopes to see develop is the establishment of union yards at San Francisco and Los Angeles and that these yards will be controlled by the producers but that packers and transportation companies be represented in the ownership and management.

As stated last week we believe that

Galls Cured While Horse Works

Don't lay your horse up in curing him of galls and sores! Don't delay and let the trouble get so bad you have to call in a veterinary. Bickmore's Gall Cure is GUARANTEED to *cure your horse while he works.* If you are not perfectly satisfied your money will be returned. Bickmore's is wonderful for collar and saddle galls, broken skin, rope burns, sore shoulder, mange and other skin diseases, bruises, cuts, chafes, mud scalds, grease heel, chapped teats on cows and other wounds on horses, cattle, pigs, and poultry. W. R. Pearson, Oakville, Kentucky, says: "I had a mare with an awfully bad shoulder but have worked her every day since I received your remedy and it has healed up nicely. I will never be without it as long as I have stock." Get Bickmore's from your druggist, harness dealer, hardware or general store. Accept no substitute; watch for the famous "Old Gray Horse" trademark—known for 34 years all over the world. Or send 10c for liberal trial sample and helpful Farm Account Book, giving valuable pointers to farmers and showing how to keep track of all expenses and receipts. Bickmore's is now being refined and put out for human use. It is called "Bickmore's XYZ Skin Ointment," and will soon win as big a reputation as Bickmore's Gall Cure. At your dealer's—or direct from us. The Bickmore Company, Dept. 315 Old Town, Maine.

Grand Champion Berkshire Blood

Ames Rival 70th

(Grand Champion) Sacramento, 1918

Introduce this blood into your herd at small expense. Buy pigs and grow them out. Mills Berkshires are utility Berkshires — bred for constitutional vigor and prolificacy. We must be satisfied they are good pigs before we ship them. Price very reasonable. Write today.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam ALBA SADIE CORNUCOPIA CRIELTA has just completed official records of 30.25 pounds butter from 736.1 pounds milk in seven days. Her previous records were as follows:

At seven years—
Milk 365 days.....18,849.40
Butter 860.28
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

Santa Anita Rancho

Anoakia Breeding Farm

Santa Anita, California

Anita M. Baldwin, Owner W. H. Taylor, Supt.

His Calves Are Beauties

Every one who is fortunate enough to own a son or daughter of KING KORNDYKE PONTIAC 20TH our $6500 herd sire, is enthusiastic about the splendid type and beautiful marking of his calves. While they are only babies his daughters show great promise of developing into exceptional dairy cows.

King Korndyke Pontiac 20th

His young sons are moving fast, and it will pay you well to see us now about one for your herd, for we are not going to be able to fully supply the demand for some time to come.

Cooperation in Dairying

Point One — Everyone should eat more milk and butter, ice cream and cheese; city people especially, but they don't know it.

Point Two — The dairyman should advertise his product same as other producers advertise theirs.

Point Three — He will sell more and at better prices and will then have more money with which he will get better cows that will give more milk per cow, that will supply the increased demand caused by his advertising that will give him more money to get more cows and so on.

Point Four — For every advertisement for butter substitutes there ought to be one for milk or butter or ice cream or cheese.

Point Five — Not an advertisement for some one's Brand but a truth telling advertisement about the product itself.

Point Six — You say you are too busy to attend to it yourself; then combine with others in the same line and who are also too busy.

Point Seven — Subscribe a small sum of money, have someone on the job for you ALL THE TIME, telling the truth to the public, contradicting erroneous and false statements putting up YOUR side of the case and all under your own control.

Point Eight — The National Dairy Council and several State Dairy Councils are doing this.

Point Nine — California Dairy Council will be ready to do it too as soon as its membership and income are large enough.

Point Ten — Write NOW. Say you want to join and ask what YOU are expected to pay.

California Dairy Council

2311 Fairfield Avenue, Hollywood, Los Angeles and 268 Market Street (Room 242) San Francisco

union stock yards are coming and we also believe that producers should take the initiative and that now is the time to start.

The live stock industry of this state has tremendous possibilities, but it is all predicated on satisfactory markets and it is not to our credit that California is being held back by our antiquated cumbersome system that broke down years ago.

Live Stock News Notes

Higdon Makes Good Sales

W. J. Higdon of the Tulare Holstein Farm has just sold the first $1000 bull calf to be raised in Tulare County, A. J. Pellerin being the buyer. The animal is Prince Korndyke Walker, son of Prince Gelsche Walker, and his dam is Leda Hengerveld De Kol Korndyke who has a seven day record of 30.87 pounds of butter from 648 pounds of milk. The bull is 14 months old. Mr. Higdon also has sold a 10 months old son of Prince Riverside Walker to J. H. Portress of Fresno for $450.

Tulare Cow Testing Association

The monthly report of the Tulare Cow testing Association for April shows 13 cows which produced more than 50 pounds of butter fat during the 30 day period. The amounts ranged from 50.40 to 78.79 pounds, produced by a Jersey belonging to A. A. Jenkins, the milk production for the cow being 1876 pounds.

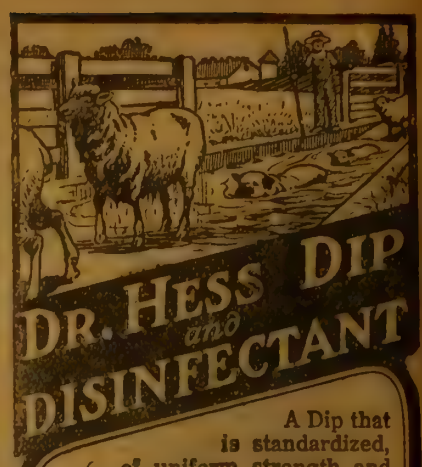
A Correction

In the issue of May 3, the statement was made that Walter Donders of Fresno had sent a very promising daughter of Prince Aralia De Kol to W. J. Higdon's herd to be put on test. The ownership of the heifer in question should have been credited to Mrs. Annie Donders of Fresno. Holstein interests will be glad to know that on April 18, this heifer, Dora Walker, broke the state record for combined milk and butter production in the senior two year old class.

Berkshire Breeder Buys Holsteins

J. Francis O'Connor, proprietor of Castleview Ranch, Santa Rosa, has recently purchased a small herd of high grade Holsteins that he will maintain as an adjunct to his Berkshire herd. O'Connor believes that there is nothing so good as milk for developing young pigs. He has secured a son of Prince Gelsche Walker out of a good producing dam and expects to eventually keep only pure bred Holsteins.

Shorthorn Sale During San Francisco Show



The California Shorthorn Breeders' Association recently met in San Francisco and decided that the association would sponsor a sale to be held at San Francisco during the live stock show scheduled for November. This association has done much to spread the propaganda of the red, white and roan, and has found the public sale one of the best mediums.

Stock in Fine Condition

J. L. Thatcher of Riverside, western representative of the Purity Biological Laboratory, Sioux City, Iowa, is planning to establish a northern office at Sacramento. Thatcher has just returned from an extended trip through the principal live stock centers of the state and says that he does not recall a year when stock in general was in better condition than this season. Feed is abundant in most sections and he says that cattle will move to market rather early. Thatcher found unusual interest in the state fair and believes that this year there will be a record beef cattle show.

Will Sell Shorthorns in August

There will be more auctions of registered Shorthorns held in California during the next six months than in any previous two years. The Butte City Ranch, Butte City will hold a calf sale early in August. Manager Guilford states that since their initial sale a few months ago many of the buyers have insisted that a fall offering be made and that the demand for registered Shorthorns is developing so rapidly in the upper Sacramento

Valley that he finds it necessary to expand the herd.

In addition to the Shorthorn offering, Shropshire sheep and Berkshires will be sold.

Can't Raise 'em Fast Enough

Mrs. Ruth Hardy, manager of the Anchorage Farm, Orland writes that the demand for Berkshires has been unusually good the past 60 days—as a matter of fact the last few months have been the most prosperous of any since the establishment of the herd. Mrs. Hardy states that the demand for bred sows and gilts greatly exceeded the supply and that the herd is quite sold out of females and that only boar pigs are for sale now.

The Anchorage Farm Berkshire herd is headed by the great boar Star Leader, reserve grand champion at the P. P. I. E.

State Fair Judges

Secretary Charles W. Paine of the State Agricultural Society states that the list of judges who will officiate at the forthcoming state fair is about complete. In addition to list recently published, Paine has secured Professor R. F. Miller of the Texas A. & M. college to judge sheep. Miller was formerly in charge of the sheep work carried on by the University of California and is regarded as one of the best authorities in the country. Guy Putman of Tecumseh, Nebraska will judge Duroc-Jerseys. Professor J. I. Thompson of the University of California will judge in the swine department. The Berkshire and Poland-China judges have not been selected.

The other judges who have accepted the invitation to serve at the 1919 state fair are: Professor E. A. Trowbridge, University of Missouri, who will judge light horses; Professor John C. Burns, Texas A. & M. College, who will judge beef cattle and draft horses; Hugh G. Van Pelt, editor of Kimball's Dairy Farmer, Waterloo, Iowa, who will judge the dairy cattle.

Secretary Paine is enthusiastic over the prospects for a record live stock show and is making every effort to secure the best judcial talent available.

Berkshires Sell Well

The dispersal sale of registered Berkshires owned by the estate of Theodore Weisendanger, Sacramento, May 6, proved to be one of the most satisfactory sales of the season.

The top of the offering was an aged sow purchased by John McCormack of Rio Vista for $200. A number of other sows sold around $150. The entire offering of 47 head, including 19 pigs, averaged $51.

The principal buyers were: Haley and Morrison, Sacramento; John McCormack, Rio Vista; Calac Orchards, Martinez; T. G. Meckfessel, Davis; Frank B. Anderson, H. C. Maddux, T. Calligon and A. J. Leifer of Sacramento; Gus Olson, Clarksburg and H. H. Cannon, Suisun. Col. Ord L. Leachman of Sacramento was the auctioneer.

Dairy Council In South

The branch of the California Dairy Council, recently organized in Los Angeles by State Manager S. H. Greene, is succeeding in getting dairymen and milk handlers into line in the advertising campaign. A regular southern representative has been appointed in C. J. Brown, whose headquarters are at 2311 Fairfield Avenue, Hollywood.

HIS BRIGHT IDEA

"Please, can you give a poor man a little something to eat? But I don't want no bread, please."

"You don't want no bread, eh? I guess you ain't starving. You can jist get along out of here."

"Wait till I explain, madam. You see, the woman next door just now give me a piece of paving stone for bread, and as she said she was the best bread maker on this street—"

"The best bread maker on this street! Jist come right in here, my poor man, and I'll show you what good bread really is. Lor', how some people does brag!"—Pittsburgh Chronicle-Telegraph.

NON-FULFILMENT OF CONTRACT

Two growers of Blackeye beans of San Bernardino County, Andrew Davis and Ernest Burris, have entered suit against the Pomona Milling Company for non-fulfilment of contract in the purchase of Blackeye beans. The suit comes off in one of the courts of Los Angeles County this week. Messrs. Davis and Burris had each contracted to deliver their crop of beans to the defendant, for which he was to pay six cents per pound less cost of grading in case of rain damage. The beans were delivered and Mr. Davis informs us that no notice of rejection of the crop was received for two months. Other growers of Blackeyes agreed with the purchasing company on a two cent pound basis. Messrs. Davis and Burris prefer, however, to leave the matter to a decision of the courts: hence the suit.

The new board of governors and members of the council of the Salt River Valley Water User's Association, Arizona, took the oath of office May 5. The Water User's Association is now an important institution, representing property worth some $20,000,000.

The Pacific Silo—Your Ideal

If all the farmers could get together, exchange ideas and agree upon an ideal silo, then start in and build it as they wanted, the result would be the Pacific.

The Pacific Silo is just the one you have always wanted. Talk to the farmer who owns one, or better still, talk to the man who owns two—a Pacific and some other. See what he says about it. His word is our best advertisement.

The Pacific is built of Redwood—that long-lived wood of everlasting qualities. Coming as it does from forest giants this wood makes a perfect silo lumber. We use nothing but selected 2-inch Redwood staves.

Heavy round steel hoops, doubled at the bottom where pressure is greatest, tightly bind and lock the staves into place. Interchangeable doors, hingeless and secured by four corner clamps. Self-supporting, water-tight cover fitted with hinged ventilator and manhole.

The Pacific is a long-lived Silo—a permanent landmark. Build it now. Your children will use it after you're gone.

No other one word in the English language describes "**Service**" such as "Pacific."

Mail the coupon today for descriptive matter and prices of Pacific Silos and Tanks. Tell us your needs and we will gladly supply any special information desired.

Water All The Time

Water is the second greatest worry of the man who owns stock. Stock need water all the time—day and night, spring, summer, winter and fall.

A PACIFIC REDWOOD TANK will provide them with plenty of water when they need it—just like a spring.

Made of heavy Redwood. Bound with large steel hoops, fitted with patent non-shrinking feature that keeps the tank always tight. Will not leak, shrink or burst. Will last a lifetime and give service every day.

Write for information about our non-shrinking feature. Find out why the Pacific is always tight and never leaks.

FISH MEAL PROVES ECONOMICAL PROTEIN SUPPLEMENT

During the annual meeting of the California Swine Breeders Association at the University Farm, Davis, April 10, Professor J. I. Thompson made public the results of a recent hog feeding test conducted to determine the relative values of certain protein supplements when fed in conjunction with barley. The test was similar to a trial carried on last fall and the results were practically the same. In giving the results Professor Thompson stated that it should be borne in mind that the figures may vary under different conditions, but that apparently they did indicate in a comparative way the relative values of the different supplements.

Four lots of ten pigs each were used. All were fed in dry lots and self feeders were used for the barley, tankage and fish meal. Lot number one received barley and skim milk. Lot number two received barley and Milkoline, a concentrated form of buttermilk. The Milkoline was fed as directed by the manufacturers, and the same amount fed as in lot number one. Lot number three received barley and tankage, lot number four barley and fish meal. The trial lasted 43 days. Below is given a table indicating the results of the trial:

Lot	1	2	3	4
Ration—	Barley. Skim Milk.	Barley. Milkoline.	Barley. Tankage.	Barley. Fish Meal.
	Lbs.	Lbs.	Lbs.	Lbs.
Initial weight	1112	1120	1115	1110
Final weight	1842	1720	1760	1789
Total gain	730	*540	645	679
Average daily gain	1.70	1.26	1.50	1.58
Average daily feed—				
Barley	6.93	7.05	6.31	6.98
Supplement	11.84	11.84	.42	.29
Feed per pound gain—				
Barley	4.08	5.61	4.54	4.42
Supplement	6.96	9.41	[illegible]	.18

*Due to substitution.

From the above figures, and knowing the local costs of the various feeds, hog raisers should be able to work out a satisfactory and economical ration.

The showing made by fish meal is particularly interesting inasmuch as this meal is a comparatively new source of protein that will undoubtedly increase in importance.

WASHINGTON WOOL SALES

Only three sales of Yakima Valley wool have been reported so far this season, and most of the buyers, who have been in Yakima from Boston, Portland and Philadelphia for several weeks past, have quit the field, the growers preferring to consign. The Ernest Berg clip was secured at 35 cents by George F. Gish of Denver, Colorado, representing George J. Webb & Company of Philadelphia. This totaled 40,000 pounds. The Stice Sheep Company clip of 12,000 pounds was purchased at a figure not announced by Charles Green, representing Hallowell, Jones & Donald of Boston, who shipped it to the Pendleton Woolen Mills for their Indian blanket trade. William Wilson's clip of 20,000 pounds went to the Dalles (Oregon) Scouring Mills to fill an Eastern order, at 35 cents. It is stated that close to 750,000 pounds of wool have been consigned. The clip is about half over and will total about 1,000,000 pounds.—G. N. Angell.

BARLEY AS DAIRY FEED

Professors Woll and Voorhies give report of extended investigations of the influence of barley on the milk secretions of cows, and the results are now issued in Bulletin 305 of the University of California, Berkeley. Barley is one of the standard feeds for all live stock in Western states, and this investigation is of material value. The summing up of the lessons of the bulletin are given in its last paragraph, which is:

"In view of the results and discussions presented in the preceding, there is every reason to utilize barley for feeding dairy cows when it is not needed for human food and whenever its price is not too high in comparison with other concentrates to make it an economical stock feed. During the past two seasons the insufficiency of the wheat supply has made it necessary for our people to use substitutes in bread making and for other household purposes, and barley was the best known substitute available. Under normal conditions of the grain market, however, and when the attention of the civilized nations shall again be turned to peaceful pursuits, the main market for barley in this country will again be for stock feeding, unless a demand for brewing barley should be reopened. In either case, barley growers may look to our stockmen to use a very large proportion of their crop, and it should be kept in mind that this cereal is well adapted for feeding different classes of farm animals, including dairy cattle."

NAPA GRADE HOLSTEINS SELL HIGH

Following closely the McGillivray sale of grade Holsteins at Sacramento, the Napa State Hospital sold 95 head of grade Holsteins for an average of $125. That average while seemingly low does not indicate that the offering included but few mature cows. As a matter of fact the bulk of the sale consisted of heifers just bred for first calving and at least 35 head ranging in age from two weeks to nine months. Only eight cows were listed. In view of the many young things it is safe to say that this sale was one of the most remarkable sales of the season and a record breaker in some respects.

A feature of the sale was the selling of the twin daughters of the famous grade cow N. S. H. Monte, which produced 20,596 pounds of milk and 762.28 pounds butter fat. One of the twins, just bred, was sold to Henry Struve of Watsonville for $300, the record price for a bred heifer, and the other, just fresh, sold for $295.

Nine pure bred bulls, yearlings and calves, sold at average prices of $335. The top bull was N. S. H. Hazelwood Netherland Korndyke, which sold to A. W. Foster of the Hopland Stock Farm, Hopland, for $600. This youngster is a grandson of the 33-pound Bonnie Lass Pauline, dam of Bonnie Ormsby Lass, grand champion at the P. P. I. E.

The sale served as another practical and forceful demonstration of the possibility of herd improvement through the use of superior bulls and careful herd management. One who is in touch with sales in general could not fail to note how the buyers appreciated this well bred lot of young things as compared to average grade offerings. It costs no more to raise the better kind and the better they are bred the more valuable and practical they are. There is no more certain way in which to increase dairy profits than through the use of well bred bulls. The men who are making the real money in the dairy business are the men who have applied that fact.

Among the heaviest buyers were George Dierson of Sacramento, Albert Meister of Sacramento, Henry Sturve of Watsonville, A. W. Foster of Hopland, and representatives of State Land Colony at Durham. Nevada buyers were represented by Professor Scott of the University of Nevada, Reno.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, and Col. Ben A. Rhoades of Los Angeles served as auctioneer.

LIVE STOCK COMMISSIONER TO SOUTH AMERICA

The bureau of markets, United States department of agriculture, has perfected plans to investigate in South America the possibilities for pure-bred stock from the United States and to stimulate interest in importations from this country. David Harrell of

Austin, Texas, who until recently was representative of the war trade board in Spain, has been appointed as live stock commissioner to perform this work, and he plans to sail about the middle of June.

MILK AND CREAM

Here are some definitions which have been adopted by the committee on definitions and standards working under the food inspection act:

Milk is the whole, fresh, clean, lacteal secretion obtained by the complete milking of one or more healthy cows, properly fed and kept, excluding that obtained within fifteen days before and five days after calving, or such longer period as may be necessary to render the milk practically colostrum free.

Skimmed milk is milk from which substantially all of the milk fat has been removed.

Cream, sweet cream, is that portion of milk, rich in milk fat, which rises to the surface of milk on standing, or is separated from it by centrifugal force. It is fresh and clean. It contains not less than 18 per cent of milk fat and not more than two-tenths per cent of acid-reacting substances calculated in terms of lactic acid.

Whipping cream is cream which contains not less than 30 per cent of milk fat.

Pasteurized milk is milk that has been subjected to a temperature not lower than 145 degrees Fahrenheit for not less than 30 minutes. Unless it is bottled hot, it is promptly cooled to 50 degrees Fahrenheit or lower.

Buttermilk is the product that remains when fat is removed from milk or cream, sweet or sour, in the process of churning. It contains not less than eight and five-tenths per cent of milk solids, not fat.

Homogenized milk or homogenized cream is milk or cream that has been mechanically treated in such a manner as to alter its physical properties, with particular reference to the condition and appearance of the fat globules.

ANNUAL MEETING OF A. J. C. C.

The rapidly increasing development of the dairy cattle industry is reflected in the year's work just finished by the American Jersey Cattle Club. In addition to recording the greatest number and percentage of registrations and transfers in its history, the breed will also be able to point to the largest number of new breeders that have ever gone into the Jersey business within one twelve-month.

The annual meeting takes place on the first Wednesday in June this year, as against the first Wednesday in May in previous years. It will be held June 4 in New York City. A "Victory Banquet" will be held the night before the meeting.

OREGON JERSEY MEN TO JUBILATE

Oregon Jerseys have been doing things and now hold four of the eight Jersey records, by ages, with prospects good for copping a third.

In honor of their achievements, and especially the two new records, those of Vive la France and Old Man's Darling II, the Oregon Jersey Cattle Club are inviting their outside brethren to join in a regular Jersey jubilee, May 20-25, when a number of Jersey herds from Portland to the state agri ultural college 100 miles to the south will be visited and inspected.

HAWAIIAN TERRITORIAL FAIR

Arrangements are being completed for the Second Territorial Fair to be held in Honolulu, Hawaii, June 9-14. The awards to be made by the live stock section show full list on Aberdeen-Angus, Herefords, Shorthorns, Ayrshires, Brown Swiss, Dutch Belted, Guernseys, Holsteins and Jerseys. In hogs, Berkshires, Durocs, Hampshires, Poland-Chinas and Tamworths, all have places on the list.

Prof. John T. Kane, extension animal husbandman of the United States department of agriculture recently visited a number of ranches in the Salt River Valley, particularly those where range steers are being finished, upon leaving he said "I believe that Arizona is the beef cattle nursery of the whole Southwest. There is a very great opportunity for the further development of the beef cattle industry, beth breeding and feeding for beef."

Care of Pigs Before Weaning

The fastest and cheapest gains by pigs are made before weaning time, so ordinarily it will pay to keep the small pig growing as rapidly as possible. The sow should, of course, get some good milk producing feed, and she should be fed to her full capacity as soon as the pigs are old enough to take all the milk she will give. It will not pay to limit the feed at this time, according to L. A. Weaver of the Missouri college of agriculture, since the pigs make the most economical gains from feed fed through the sow. When the pigs are about a month old, they will be able to use more feed than that obtained from the sow even though the sow is properly fed and a good milker.

As soon as the pigs will eat, which is usually at four or five weeks of age, they should be fed separately from their dam. They should have access to a small pen where the sow cannot go to receive their feed. Skim milk fed in a shallow pan is very good for them. The pigs may also be taught to run into the creep for feed by allowing them some shelled or ear corn. As soon as they begin to eat well, a slop made of milk, some shorts, a little bran, and some linseed oil meal or tankage, fed along with the corn, will make a ration which, with proper exercise, will prevent thumps or scours.

A good ration for young pigs is made up of four parts by weight of corn, four parts of shorts, one part of bran, and one part of tankage. As the pigs become older the corn may be gradually increased until the amount has been doubled.

In addition to proper feed, however, the pigs must have plenty of sunshine and exercise. These things cost little to supply and are absolutely necessary for best results.

FEED MINERALS TO HOG

Watch the mineral part of a hog's ration.

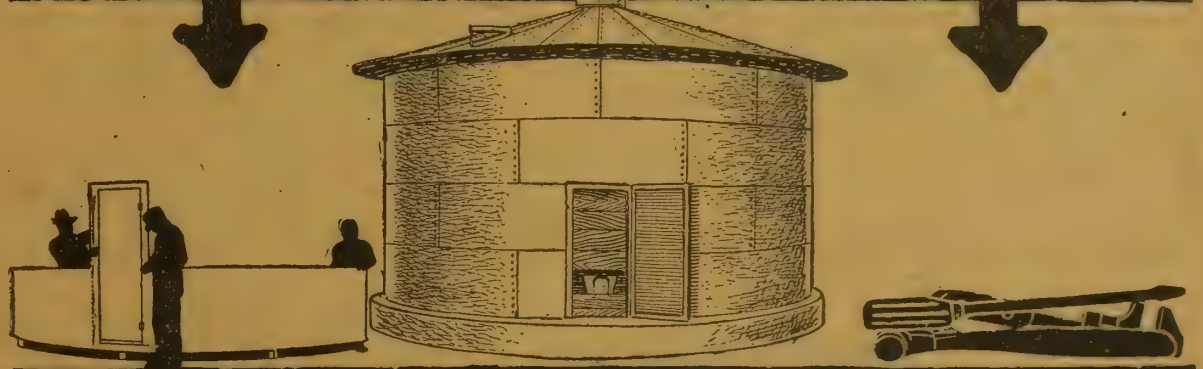
This is the advice of specialists in the Kansas state agricultural college. A hog requires a continual supply of minerals, contained in feeds, if its bodily functions are to be kept in healthful operation.

If proper minerals are not supplied a hog is compelled to draw on his own body for them. This is dangerous. Weakness in the legs, cramp, and excitability, are some of the symptoms that develop. Unless the condition is corrected, death results. It has been found that hogs given absolutely no mineral matter in food die more quickly than if given no food at all.

Minerals contained in the body of a hog include potash, soda, lime, magnesia, oxides of iron, phosphoric and sulphuric acids, and chlorine. This is shown by an analysis of ashes from a burned carcass.

Young Pigs Need Attention

Chlorine and sodium help in the digestion and assimilation of food. Sodium chloride makes many feeding stuffs more palatable and promotes the flow of digestive juices. Potassium is found in cell walls, in muscles, and in blood corpuscles. Sodium is present in blood, lymph, saliva, and gastric juice. Lime, magnesia, and phosphoric acid are in bones and other parts of the body.



Hogs, and especially young pigs, need more attention along this line than other kinds of stock, because they are limited in variety of food. Horses, cattle, and sheep eat more "roughness" and so have better chances to acquire the mineral constituent.

Here are some of the feeds which will supply mineral matter:

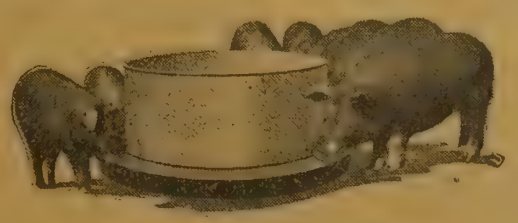
Lime—clovers, hay, and legume seeds; phosphoric acid—straw, chaff of cereals, pulped mangels, potatoes, bran, and slaughter house products; inorganic phosphorus and lime—precipitated calcium phosphate, burned bones, or ground rock phosphate.

If lime alone is needed, chalk may be fed.

Three men and these tools

will put up a CALCO BIN quickly

ERECTING a Calco Grain Bin is simplicity itself. A book of instruction, illustrated, accompanies each bin. Every piece of the Calco Bin fits—exactly. No skilled labor is needed, three men and three tools can do it quickly. From laying out the guide stakes to fastening on the ventilator cap—every operation follows naturally—the result is a permanent investment on your farm.



The free booklet "Calco Grain Bins" tells of many ways of saving money with the Calco. Write for it today.

Model 244

Calco Hog Trough

Popular because practical. They help raise healthy hogs; they are sanitary, strong and durable. Built of Armco Iron and Cast Iron. Lengths from 24 to 120 inches. Ask for price list of this profit increasing trough.

Model 252

Calco Automatic Hog Watering Fountain

Constant fresh water, without overflowing. Connects to water supply pipe—works automatically. Bottom and trough of cast iron, reservoir of galvanized Armco Iron. Write for circular with complete specifications and prices.

Model 250

Calco Automatic Grain Feeder

Gives plenty of feed—without waste. Feeding trough and bottom of cast iron, storage bin of galvanized Armco Iron. Capacities from 2 to 10 bushels. Write for details and price list.

When Dairying and Cooperation Combine

TO MAKE dairying mean more prosperity instead of drudgery has been the notable achievement in the Grove City community of Pennsylvania. Unprofitable methods with inability of local farmers to gain more than a meager living from the soil had distributed seeds of discouragement throughout the community.

Under such conditions the United States department of agriculture induced the business men and others of Grove City to establish a creamery. Built and equipped by home capital, this plant is operated by the department as a part of its experimental and demonstration work. In three years Grove City has developed into an advanced dairy community. The first day the creamery opened its doors 20 patrons marketed 78 pounds of butterfat. By June 30 of the same year the number of patrons had increased to 106, a year later to 338, the next year 579, and at the end of the third year, or June 30, 1918, it was 614. But the increase in the income is even more remarkable. The first fiscal year, or from July 1, 1915, to June 30, 1916, inclusive, the gross income of the creamery was $82,432; the second year it had increased to $212,904, and the third year it was $375,596. Last year one of the Grove City banks increased its deposits $450,000 of which approximately one-third resulted directly from dairy farming improvement.

City Helping Country

The Grove City community has followed the principle that "In union there is strength," and at the present time is admirably organized for profitable results. The local commercial club of 200 members has been of great assistance in winning the confidence of the farmers, in making them feel at home, in entertaining them and in strengthening the bonds between them and their town neighbors. The club rooms are now used as headquarters by farmers and their families when they are in town and twenty of the most progressive farmers are now members. Often the club has been active in obtaining help for the farmers during busy times while occasionally the members themselves have assisted the farmers in urgent work.

The two local banks have supported the "better agriculture" movement and one of them has aided in financing the purchase of pure bred dairy sires and cows. It has brought in eight carloads of high producing animals and distributed the cattle at cost among the farmers. In addition it has loaned money for the purchase of better cattle and for general farm improvement. The bank publishes a monthly paper which circulates among the creamery patrons and deals with community development problems and other topics of interest. Each month it publishes the names of farmers receiving the largest checks from the creamery and the names of the owners of cows whose average production exceeds 40 pounds of butterfat a month. The lists stimulate friendly rivalry among dairymen and benefit the local industry.

More Good Cows Brought In

Today Grove City is a region of profitable dairy cows, due to the intensive work of the home cow testing association which has worked for the shipping in of better dairy animals and the shipping out of low producers. Farmers have heeded the evidence of the milk scales and the Babcock test. One dairyman found that nine of his eleven cows were "loafers." He immediately sold them to a local butcher and purchased profitable stock to take their places. The Grove City Cow Testing Association records for 1917 and 1918 show that it cost an average of $74 a cow to feed the 262 cows that completed a year's test—approximately $50 to feed the lowest producers, and $97 for the cows whose average production was 400 pounds or more of butterfat a year. One cow in the 400 pounds class yielded more income over cost of feed than an entire group of 25 cows that averaged only 100 pounds of fat a year.

Work of the Bull Association

Two cooperative bull associations, Jersey and Holstein-Friesian, have been organized since the development work began. Each of these organizations is divided into four sections or blocks, with one bull to each block. The Holstein-Friesian Bull Association consists of 25 farmers who subscribed $75 each for the purchase of four registered Holstein sires of meritorious breeding. To avoid inbreeding, the sires are changed from one block to another every two years, and according to this plan the bulls now will be serviceable for the next eight years. Thus each member of the club gets the use of a fine sire while the organization is able to keep its bulls at a maintenance cost of about one-sixth of what it would be if each herd were headed by a separate bull. The Jersey Bull Association was organized along similar lines. This campaign for better breeding has brought about the establishment of more than 40 pure bred herds in the community during the last year.

The Guernsey Breeders' Association at Grove City consists of 28 members, owning 71 registered Guernseys, each member owning either outright or

Redwood Tank Outlasts 4 Towers

Prior to American occupation in California (1846) a ranchman near Cayucos erected a Redwood Tank on a tower of other wood. Since that time he and his son, who succeeded him, have put four towers under this same tank, replacing towers that had decayed.

Four years ago the owner built a redwood tower under this famous old veteran tank and both are now good for many years to come.

He also installed a Remco Redwood Silo.

There are hundreds and thousands of Redwood Tanks in California that are from 30 to 40 years old.

jointly a carefully selected registerd sire.

In the main, the dairy cattle in the community are free from tuberculosis; more than 100 herds have successfuly passed two annual or three semi-annual official tuberculin tests. As a result they have been included in the tuberculosis-free accredited herds listed by the United States department of agriculture.

Boys and Girls Working Too

The Boys 'and Girls' Pure Bred Dairy Cattle Club was organized more than a year ago with 53 members. In addition to the cattle club there are pig clubs, garden clubs, canning clubs, and a club recently organized under the direction of the county agent known as "The Young Farmer Club", in which eligibility to membership requires the winning of a prize in some "worth while" contest.

In spite of the high price of building materials last year, 25 new silos have been built while 57 old barns have been remodeled and equipped with such improvements as concrete floors, up to date stanchions and better lighting and ventilating facilities. In the Grove City district, dairy development has made such rapid progress that many dairymen have had to keep their cattle in barns not designed for such a purpose. However, using these old barns has allowed the dairymen to devote more of their capital to the purchase of high producing cattle.

Another organization, known as the Grove City Federal and State Accredited Dairy Cattle Show and Sales Association, encourages the development of healthy herds and the exhibition and sale of dairy cattle. Each member must furnish the secretary-treasurer with an extended pedigree of all animals he offers for sale or exchange. Once a year the county holds a round-up picnic and dairy cattle show. Last year 1500 people attended.

Example for Other Communities

The creamery fieldman aids the farmers in building silos, remodeling and rearranging their barns, tuberculin testing their herds, detecting and disposing of undesirable cows.

Under the supervision of a qualified man, practically any farming community, it is believed, can improve its organization, farming methods, market operations, and similar activities. Whenever such a community tackles the business of self advancement energetically in the proper manner, a spirit of confidence will prevail and work well begun will go forward to still further success.

The foregoing information comes from a recent publication of the department of agriculture. "How Dairying Built Up a Community."

HOW PURE BREDS PAY

Not long ago there appeared in the Cultivator an article setting forth the results that had been obtained through the use of pure bred bulls in the herd of cattle maintained on the great Parker ranch in the Hawaiian Islands. The figures were for dressed carcass weights over a period of years and indicated a steady increase in weights, most of which could be credited to the policy of using high class bulls.

One of our valued readers was inclined to discount the value of better blood on the range. For his especial benefit, and other doubting cattlemen, we take the liberty of quoting the following story by Will C. Barnes, of the Forest Service, which appeared in a recent issue of The Breeder's Gazette. Mr. Barnes wrote as follows:

"Some months ago one of your California subscribers wrote inquiring as to the 'feeding and fattening of pure bred cattle in comparison with inferior grades,' his idea evidently being as he frankly put it 'to prove that the policy of the Forest Service in advocating pure bred cattle is not wise.' Dr. True of the University of California answered the question admirably from the feedlot standpoint, but the inquiry was perhaps quite as much tied up with range fattening as with the feedlot. Running over some reports recently I came across one from the supervisor of one of our northern Utah forests in which some figures were given that answered this man's question so nicely that I can not refrain from giving them. They show how well-bred cattle will make good when placed in competition with scrubs, and grazed entirely on range grasses and forage.

"Near this Utah forest two neighbors owned about the same number of cattle, wintering them partly on open public domain ranges supplemented with some roughage near spring. The two herds then entered the forest ranges for the summer season at about the same time, used them for the same number of months, and grazed on practically the same kind of grasses and forage plants while there. Each man paid exactly the same grazing fees and each herd received the same attention from its owners, which I may say was very little. In the fall the steers from the two herds were cut out and shipped the same day on the same train to the same commission house in Omaha, where they were sold the same day under identical market conditions. Both bunches were fat. The pure breds, well-bred Herefords, brought $2 per cwt. more in cash than their scrubby brethren, averaged 200 pounds more in weight and netted their owner exactly $40 per head more than the scrubs netted their owner.

"They say that 'money talks.' That extra $40 did some talking for improved stock. I fancy that to the owner of the pure bred steers it talked with soft and kindly accents all the way back to his Utah ranch."

At Public Auction, Tuesday, May 27, 1919

State Fair Grounds, Sacramento, Calif.

In this history making sale Mr. Clifford F. Reid, president of the Northwestern Trust Company, Portland, Oregon, will disperse his entire herd of famous producing and show winning registered Jerseys. The demands made upon his time by his several large commercial enterprises led Mr. Reid to the decision to sell this splendid herd, and other breeders will profit themselves if they take full advantage of the opportunity to buy from this offering.

The Goldie's Nehalem Beauty Group

There will be 50 head of males and females in the sale, of which number the wonderful cow Goldie's Nehalem Beauty, her dam, two sisters, one daughter, two sons, fourteen granddaughters, and six grandsons, account for 27 head. The balance are choice cows, some of them imported and some with good Register of Merit records, together with their offspring

Who Will Own Goldie's Nehalem Beauty?

What Jersey breeder is going to own this great young cow and add to his herd one of the very greatest cows the Jersey breed has yet produced? No Jersey cow in the world ever sold in public sale with as high a record as she has, and she is looked upon as a candidate for even higher honors after her next September freshening.

Who Will Own Her Two Sons?

What breeders are going to be far-sighted enough to own her two sons that will be in this sale. Think what it will mean to the two California herds, assuming that these two bulls both stay in California, to have at their heads the two highest record Jersey bulls in the state! Surely it is THE opportunity for someone to get on the Jersey map BIG and QUICKLY.

Goldie's Nehalem Gold
One of the sons of Goldie's Nehalem Beauty in sale

Goldie's Catillon Beauty
Daughter of Goldie's Nehalem Beauty in sale

Come to this great sale, whether you want cows, heifers, service bulls or bull calves. It will be worth while if you want the good ones.

Sale Begins Promptly at 10 a.m.

REMEMBER—This herd is now and has been for a long time under Federal supervision for health and not a suspicious animal on the last tuberculin test.

FOR
Your Poultry Products

Ten Reasons Why the National Poultry Co., Inc. Should Receive Your Poultry Products

First: The National Poultry Company has set a standard and established a reputation which must be maintained. It will be maintained, because the same principles that have given character to our establishment since we were doing business in a 25 foot, one-story building are maintained in our modern plant.

Second: The National Poultry Company's reputation is built on fair dealings, honest weights, and quick remittances, covering a period of ten years. Ask your own banker about us.

Third: This explains why the National Poultry Company's methods stand out so strongly, why we were unanimously chosen by the Poultry Producers' Association of Southern California, a body of 530 leading poultry men, to exclusively handle 100,000 of their broilers.

Fourth: This is why thousands of California, Arizona, New Mexico and Nevada producers ship us regularly every season.

Fifth: Because we are the largest exclusive wholesale poultry plant on the Pacific Coast. Our capacity is 32,000 live broilers on feed at one time. We have our own cold storage plant on our premises. The only poultry firm in Los Angeles having trackage to the door for handling carload lots.

Sixth: It has been our conviction that in the poultry business, as elsewhere, patronage will always go where it is best treated.

Seventh: It has been our conviction also that the more the producer gets out of his shipment, the better showing we can make for ourselves in increased sales. The new business method is the increased volume of business on a small margin of profit.

Eighth: The National Poultry Company realizes its obligations to continue this same method with increasing usefulness to producers.

Ninth: It is unthinkable now that we should imperil our position by abandoning the policy that has made us.

Tenth: The above methods have always been the standard which J. Will Blackman, president of the National Poultry Company, has applied in building up this business.

Treatment for Roup

By Jean A. Koethen

ROUP is rather a fall than a spring disease, and yet there are some cases even now, especially in those sections where fogs are of frequent occurrence. It may affect the head, in which case there is a discharge from the nostrils, thin at first, but gradually growing thicker and more putrid, often a swelling of the eyes which are sometimes stuck together, and sometimes an abscess, or more than one, in the eyelid or between the eye and the mouth. It may affect the throat, in which case a diphtheretic membrane forms and the bird may choke to death. Happily these diphtheretic cases are rare at any season.

It is always difficult to tell just when a cold ceases to be a cold and becomes roup. Some poultrymen are inclined to call every cold roup. Salmon describes "non-contagious catarrh," or cold, as a disease which usually affects only a few individuals in the flock. "They are disinclined to move, appetites are diminshed, they sneeze and the mucous membrane is thickened, causing some obstruction to breathing through the nostrils. There soon appears a thin, watery discharge which later becomes thicker and glutinous, the eyes are often watery, the eyelids swollen and sometimes held together by a thick, viscid secretion." In roup, "the first symptom of the disease is usually a putrid catarrh from the nostrils, the affected fowl is generally restless, separates from the other members of the flock becomes dull, cowers in the corner of the coop or mopes in the corner of the pen, with its head close to its body and often covered with its wings, and the eyes often shut, the lids being glued together by the sticky discharge from them."

Whether the symptoms are those of roup or only of cold, the sick bird should be removed from the flock and put in a warm, dry place. If it will eat, give it all the greens it will consume and nourishing food such as bread and milk or chopped cooked meat. Unfortunately, a very sick bird will not eat, and this makes treatment more difficult.

The simplest treatment for roup is what is called the permanganate treatment, and this should always be tried first. Into a lard pail full of tepid or warmish water drop a few crystals of potassium permangante—just enough to make the water a deep pink. Into this solution dip the head of the sick bird after pressing with the fingers between nostrils and eyes to loosen the discharge and hold it under a few seconds. This cleanses the nasal passages and eyes, and if it is repeated twice a day, with the solution fresh each time, usually cures all but the most serious cases.

When there are abscesses in the face or about the eyes, they must be opened and cleansed with some antiseptic application, such as two per cent boric acid in a decoction of chamomile flowers, or one-half per cent solution of corrosive sublimate. Sometimes these abscesses are inside the mouth or in the throat, when they should be opened and the cavity sprayed or washed. Salmon recommends washing cavities of nose and throat with peroxide of hydrogen diluted one to three times with water. Sanborn recommends spraying with the following mixture: Extract of witch hazel, four tablespoons; liquid carbolic acid, three drops; water, two tablespoons. He applies the spray twice a day, squeezing the bulb five times for each nostril and twice for the mouth.

POULTRYMAN'S CALENDAR—MAY, THE TURKEY MONTH

Lice, overfeeding and dampness are the three great enemies of baby turkeys, but the greatest of these is overfeeding.

Dust all poults on the head as soon as they are put in the coop with buhach powder. If the hen has not been dusted before the hatch came off, dust her well. There is no excuse for lice on turkeys.

Move the coop in which the poults are brooded to new ground at least every week. They should be on the ground, but the ground must be clean.

The more green range poults have, the less they should be fed.

Clabbered milk and cottage cheese and greens, especially onions and onion tops, are the safest feeds for poults, but whatever you feed, never let them have all they want. It is not what you feed that matters so much as how much.

The second month is the critical one, for it is then that blackhead most frequently appears. Turks can stand overfeeding for a while, but in the second month they are quite sure to succumb if they have been overfed.

Let the first grain feed given be rolled oats and do not be in a hurry to add other grain. This may seem an expensive ration, but it is less expensive than losing the turkeys.

To Preserve Eggs

By Jean A. Koethen

Of all sad words of tongue or pen,
The saddest are these—"I have no hen".

So writes a would-be humorist, but what he says is no joke at all. It is the plain, unvarnished truth. Especially true is it in this spring season, when every hen is shelling out eggs, for the hen owner may not only have bacon and eggs every morning, but he may prudently provide for a continuous supply of fresh eggs for seven or eight months to come.

The preserving of eggs in waterglass has become so common that it is hardly necessary to give directions for it, and yet there are always those who are beginning, and others, perhaps, who have tried and not had the best success. Only last week a friend said to me: "Mrs. B— says she tried preserving eggs last year, and when she came to take them out of the solution they were all rotten."

If waterglass eggs are rotten, it simply shows that sufficient care has not been exercised in putting them down. The art of preserving eggs is made up of apparently insignificant details, but ignoring one of these details may easily cause the loss of many dozen eggs.

The principle on which sodium silicate or waterglass is used for the preservation of eggs is simply this, that the solution makes a coating over the pores of the egg, excluding the air. If this coating is absolutely clean the egg is kept comparatively fresh for a long time. If the coating contains germs of any sort these germs find their way through the pores to the inside of the egg and work dreadful havoc there. Now if the sodium silicate is poured directly from the bottle into boiled water, and the solution covered and kept covered there is only one way in which germs can contaminate it, and that is from the eggs themselves. Eggs that are put into waterglass must be fresh. They should also be infertile. A fertile egg will rot sooner or later, and one rotten egg in a five-gallon jar of infertile eggs might easily spoil the whole. Not only should they be fresh and fertile, they should be clean. One never knows how many germs there may be in the dirt on the outside of a dirty egg.

But if the eggs are dirty, don't wash

them. Washing removes the delicate coating on the outside of the shell, and while the immediate application of the silicate coating lessens the likelihood of air or bacteria entering the egg, it is best to take no chances. In egg preserving, as in surgery, absolute cleanliness is the one essential. If eggs are dirty, wipe them with a slightly damp cloth. If this does not clean them do not try to preserve them.

The preserving solution is prepared by boiling nearly enough water to fill the jar or keg that is to be used, and then letting it cool before the waterglass, which may be bought at any drug store, is added. Some of the published directions give one part waterglass to ten of water as the correct proportion. Others make the proportion of water a little greater. One to ten is certainly safe; one to 11 or 12 may be equally so. Whatever proportion of water you use, remember that the solution will gradually thicken as it stands, on account of evaporation, hence more boiled water must be added from time to time.

When the sodium silicate has been well stirred into the boiled water, the solution is ready for the eggs. "Why must it be stirred in?" is sometimes asked. Just to make sure that the silicate is uniformly distributed through the whole solution. Now bring in your eggs, fresh laid, wipe the dusty ones, and discard all that are cracked, fertile, or cannot be wiped clean. Drop them in and cover the jar. Every egg in the jar must always be completely immersed in the solution. If one side of one egg is out of water there is a chance for germs to enter. Keep the jar (a stone one is best) in the cellar or in some other cool, dark place, and in six months from now, if you have been careful to follow directions, you may fry the eggs from that jar and hardly know that they were not laid the day before.

POULTRY SCHOOL

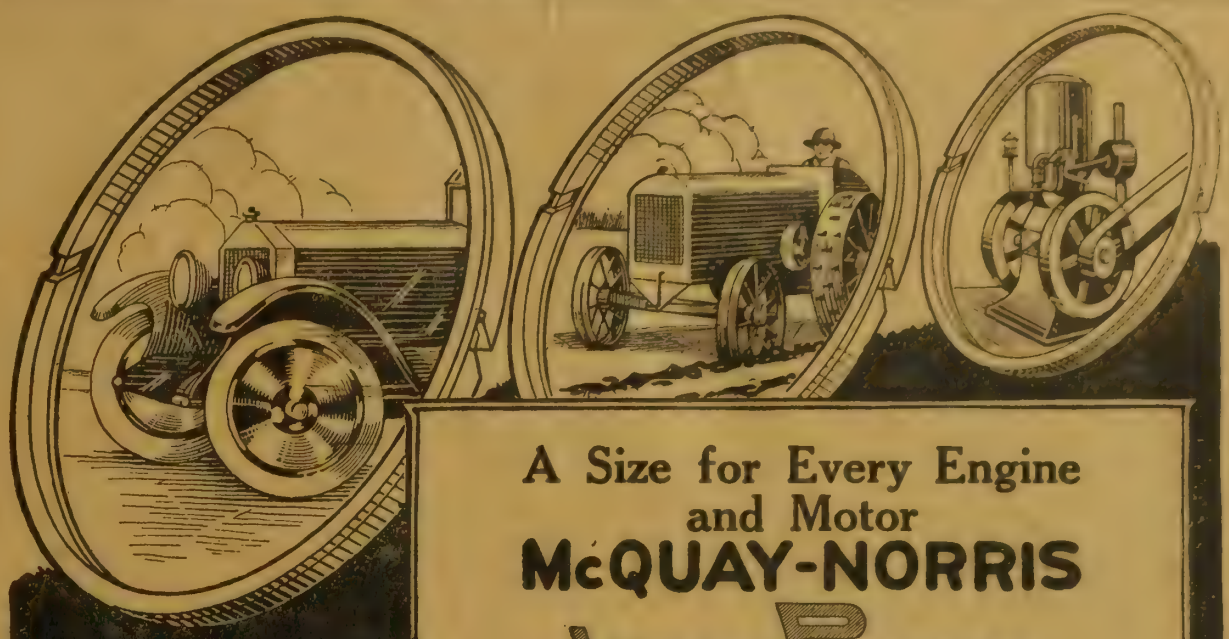
The University of California will hold its Southern California school this year at San Gabriel Mission Play house near Los Angeles. Former schools have been held at Riverside, Pomona, Van Nuys and Gardena.

More romantic or historical setting could not have been chosen for this school which will begin Monday morning, May 26, and continue to and including the 29th. It will be under the direction of Professor J. E. Dougherty who will be assisted by E. J. Hauser.

POULTRY KEEPING FOR THE BLIND

Blind Edward Jones of Jefferson City, Missouri, has made a record in keeping poultry which many who have eyes have not equaled. Moving among his birds, which seem to understand how he is handicapped, and guided only by his sense of touch, he performs his daily work. He has built his own poultry house and brood coops, and has hatched and raised all his chicks. Blindness does not prevent him from culling his flock. The birds not intended to be kept are marketed as broilers, and the others are kept for the production of winter eggs.

Mr. Jones attended every poultry meeting held in his section last fall. He is now trying to organize a poultry club for blind people, and the home demonstration agent in the county has volunteered to read to the members the publications on poultry sent from the United States department of agriculture.



HURRICANE SERVICE EXTENDED

The weather bureau of the United States department of agriculture is arranging to install at Fort Myers, on the southwest coast of Florida, about 150 miles south of Tampa, a special meteorological station to aid in the detection of the tropical storms that appear at intervals from June to November. The new station is expected to be in operation about June 1. The weather bureau already has in operation in the Caribbean Sea region about 15 stations, most of them located on islands under the sovereignty of foreign governments. These stations furnish the "hurricane service" which gives warning of dangerous weather disturbances in the Caribbean Sea and the Gulf of Mexico. Through the observations cabled or sent by wireless to the weather bureau at Washington "the makings" of great storms often are identified while in the germ stage, sometimes days before these disturbances have developed into the hurricanes that spell danger to shipping and to life on shore. When a storm appears to be brewing in this "breeding place of hurricanes" warnings are sent throughout the endangered region by every possible means, and records show that much life and property have been saved through the service.

THE WRONG END

An irate man rushed into a local drug store the other day and demanded his money back. "You advertised 'No more colds, no more coughs, certain cure'," he shouted, adding "and I've drunk the whole darn bottle and I've got a peach of a cold.'

The clerk answered mildly: "Why didn't you read the label? This is a solution to put on the soles of your shoes to keep them dry."

McQUAY-NORRIS
Superoyl
RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in lower grooves to insure maximum compression and fuel economy.

A Size for Every Engine and Motor

McQUAY-NORRIS

LEAK-PROOF

PISTON RINGS

Increase Power—Decrease Carbon
Save Gas

The design and construction of these rings assures uniform action all around the cylinder wall—power producers because they leave no place for the power to slip past.

Wherever you are and whatever your motor, you can get immediate service on these rings. Complete stocks of standard and over-size rings are carried by over 300 jobbers and supply houses throughout the country. Many thousands of dealers can extend to you our service, which enables them to specify your size requirements for practically every make or model of motor without delay. You don't have to wait.

Send for Free Booklet
"To Have and to Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

HIGH DUTY MARINE TURBINE PUMPS
32ND AND SANTA FE AVE.
LOS ANGELES

Fairbanks, Morse & Co., Feb. 26th. 1919.
Los Angeles, Cal.

Gentlemen;

The record of the 25 horse-power, "Y" Engine, you installed at the Price Ranch, over two years ago, speaks for itself:-

When not irrigating our 65 acres of Valencias, we sell water and the plant runs almost constantly, our longest run being 46 days without a stop.

Fuel-	48 Gal. per. 24 hours-	@5¢-	$2.40
Lub. Oil-	1½ " " " "	@36¢	.54
Man's time figured liberally-			.56
			$3.50

Making the cost of pumping 70 inches of water, from 60 feet- 5¢ per. inch, per twenty four hours.

The man fills the 5 gal. lubricating oil tank (when necessary) the first thing in the morning and inspects the oiling system on his way to dinner and to supper totalling, possibly ½ hour per. day. We have not spent one cent for repairs on either engine or pump since you installed them.

Yours truly,

CEP/3

MULES

For Sale — Twenty-five young mules, one and two years old. Chas. Hubbard, Riverdale, California.

HOGS

NICK GENTRY
Dean of the Berkshire Breeders, breeder of Baron Duke 201st, Grand National Champion, says: "I never saw a better width of loin than he has. If more breeders would produce the type of Baron Duke 201st there would be many more Berkshires raised and sold. Every animal on both sides in pedigree of Baron Duke 201st for many generations back were good ones; every one of them. His great size, good heart girth, very smooth shoulder, back and loin, legs and feet are hard to equal in one animal. If he is not a good one and a well bred one there is no other. I am glad to give you my opinion of Baron Duke 201st." N. H. GENTRY.
You can buy his three months' old weanling pigs from 650-pound prolific sows for $35.00. They are going fast. Order now.
SANDERCOCK LAND CO.
In charge of Natomas Land Sales.,

FARM LANDS FOR SALE

For Sale—140 Acre Improved Ranch including household goods, crops, live stock, tools, at a price 100 per cent lower than anything of equal value obtainable in Southern California. Poor health compels me to give up heavy farm work. This is the proposition: 80 acres in heavy crop hay, 10 acres in potatoes, 20 acres set to walnuts, 4 to almonds. Large family orchard. New buildings. Crop should net $4000 to $5000—available within a few weeks. Location Fallbrook, state highway, 2 miles from R. R. and P. O. 800 feet elevation. 12 miles to ocean, 105 to L. A. coast route. The peer of any climate in California. No frost. Large portion of land proved highest grade citrus land. (Lemons adjoining). More good walnut and almond land; some for alfalfa without irrigating. Water in abundance and going to waste, at practically no cost. I will retain a small portion of property if a buyer can't handle it all. Price complete, including crops, $19,000 — $12,000 cash. Would take as part payment small, improved, well located ranch to five or seven thousand dollars. At this figure I will guarantee a sale within ten days and if interested suggest quick action. C. E. HOWLAND, Fallbrook, California, Box 14.

For Sale—18-Acre Country Home. Situated five miles from SANTA CRUZ on beautiful Branciforte Drive, among the redwoods. Rural delivery, telephone, living stream, unlimited water supply. Seven acres practically level, ideal for strawberries, poultry or alfalfa. Acre and half family orchard. Balance of land in wooded pasture. New modern house of nine rooms. Has four sleeping porches, attic, concrete basement, furnace and showers. Finest of plumbing throughout. Has own electric light and power plant. Water system, separate cottages for help. Garage, barn and sheds. Beautiful views and scenery. Gardens. All within 20 minutes of Santa Cruz beach. Address "Owner," 221 Branciforte Drive, Santa Cruz, California.

British Columbia—Choice of three mixed farming ranches in Central British Columbia, partly improved. GOOD ARABLE LAND. Plenty grass and extra cattle range from B. C. Government at low rental or for purchase. Owner is experienced British Columbia Land Surveyor in delicate health. He will, in each case, give two years option to purchase at $110. Semi annual rental, in advance, after examination. OWNER WILL PAY TAXES. State in first letter, whether interested in CATTLE, HOGS, SHEEP, Dairy Stock, GRAIN, or a mixture. Also please state your resources. J. H. Brownlee, CANADIAN LAND SURVEYOR, 403 Peoples Saving Bank Building, Sacramento, California.

SAN FERNANDO VALLEY

For Sale—40 Acres San Fernando Valley land just one mile from stores, schools, boulevard and railroad station; water main on two sides; rented for $25 an acre cash rent; no sand or washes, all fine soil. Priced for quick sale at $350 per acre; good terms. H. L. ALLARD, 410 Security Bldg., Los Angeles. Phone Broadway 1696.

For Sale—Ranch of 37 Acres, good buildings; modern conveniences. A good orchard or vineyard proposition. Close to school, store and church. Five miles from Escondido. Might consider some exchange. $2500 cash will handle this property, balance can be arranged to suit. Inquire Cultivator. Box B. A. J.

Mountain Ranch—334 Acres, 90 acres under cultivation, 30 acres Bearing Orchard; balance in Timber, Oak and Pine. Free Water, deep, rich soil, eight-room house, 100 tons hay, barn and out buildings. Will subdivide. Price $7500. Terms. Address, Paradise Ranchita, P. O. Box 123, Paradise, Butte County, California.

For Sale—$1000; clear; 160 acres, 30 miles northeast San Diego; 25 tillable rolling, 15 bottom, three plowed, balance grazing. Small new house, well, spring, timber. Abundance water to irrigate bottom. Fine bee, cow, pig proposition. E. T. Gray, (Owner), Petrolia, California.

For Sale—Good Unimproved Land near Delano. Soil a sandy loam with no hardpan. Easily leveled, water conditions IDEAL. Unlimited supply with lift of only 25 feet. Cheap electric power. Price right. Terms easy. Bidelman, 523 Black Bldg., Los Angeles.

For Sale—320 Acres Alfalfa Land, including water, located in Kings Co. Price, $100 per acre. Will divide, terms. J. A. Elliott, owner, 130 E. 25th street, Los Angeles. Phone 63247.

GIVING THE SOIL A DRINK

(Continued from Page 687)

serve that by ordering an outfit of slightly larger capacity water may be supplied for stock as well, thereby eliminating hand pumping or the drudgery of carrying. In computing the amount of water required when asking for information the following figures are handy to have in mind: Each horse requires an average of 10 gallons per day, each cow 10 gallons per day, each hog two gallons per day, each sheep one gallon per day.

In wrestling with the problems of water distribution it is also convenient to know that a gallon of water weighs eight and one-third pounds and contains 231 cubic inches. A cubic foot of water weights 62½ pounds and contains 1728 cubic inches or seven and one-half gallons; 31½ gallons constitute a barrel. A cubic foot per second equals 450 gallons per minute while an acre foot is 325,829 gallons. When finding the velocity in feet per minute necessary to discharge a given volume of water in a given time multiply the number of cubic feet of water by 144 and divide the result by the area of the pipe in inches. Doubling the diameter of a pipe increases the capacity four times.

A type of pump that has been developing with rapid strides of late is the centrifugal. These are now manufactured in horizontal and vertical types and embody principles of construction and operation that make them highly dependable.

In California, the State of Paradoxes, conditions vary so widely that a separate treatise could be written upon the methods of irrigation most adaptable to each locality. There are many who can give reliable advice because they have passed through bitter and expensive experiences while others have been fortunate enough to hit upon a practical equipment and system with their initial investment.

Very few places in the state offer a dependable supply of irrigation water that can be distributed without a pumping plant. The man who relies entirely upon surface supply and gravity, as did his unenlightened ancestors, is destined to come to grief unless unusually fortunate. With an individual pumping plant installed the agriculturist can irrigate whenever necessary and put on exactly the proper amount of water. As is the case with all modern farm appliances he will discover that the first cost is soon erased by efficiency, dependability and convenience.

RABBITS

Raise Rabbits for us. We supply the breeding stock. Send stamp for particulars. H. E. Gibson Co., Arcadia, California.

For Sale — Rabbits, New Zealand and Flemish Giants, young stock. Paul Kruger, Watsonville, California.

For Sale — Thoroughbred rabbits, all breeds. G. O. Tetley, 190 Edgwood Place, Riverside.

"Wouldn't take anything for my Auto-Wheel"

—and you'd feel just like this fellow, too, if you owned an Auto-Wheel.

YOU have no idea what an Auto-Wheel means to the boy on the farm. A boy can't make much headway if he has to do his hauling with a heavy, clumsy wheelbarrow—but just give him an Auto-Wheel! It's a fact, he can bring up stove-wood, gather apples, sack and haul in potatoes, go down in the field for corn, or do a dozen other jobs as easy as playing if he has an Auto-Wheel.

And when his work is finished—he can have the time of his life playing with the Auto-Wheel. It's the ideal wagon for work or play. Has genuine roller bearings, steel axles and tires and a solid ash body built like an automobile.

Send For Booklet and FREE Felt Pennant.

Write us the names of three firms who sell coaster wagons (mentioning which handles the Auto-Wheel) and we'll send you beautiful Felt Pennant Free, also catalog and full particulars of Auto-Wheel Coaster and Convertible Roadster.

Household Department

CHEER UP!

A feller has his worries, an' the world looks mighty black,
He kind of feels discouraged, there's a big load on his back;
He ain't got no ambition, an' he heaves a hopeless sigh—
But there'll always be a rainbow when the clouds drift by.

When the world is lookin' darkest, an' there's nothin' round but gloom
Then a feller gives up hopin' an' there's nothin' left but doom;
But he shouldn't let his troubles cause his mind to mortify—
For there'll always be a rainbow when the clouds drift by.

Straighten up an' sing a little, just brace up an' wear a grin,
For old Trouble hates a smiler like the good Lord hates a sin;
An' remember that the blacker an' the gloomier the sky—
There will always be a rainbow when the clouds drift by.

—Luke McLuke.

THE NEW RUSSIA IN ASIA

FROM the old Russia in Europe, a new Russia is rising in Asia, organized on many of the better elements of the old Russian civilization and containing many potential elements of strength which may later result in a new government knocking at the door of nations for admission as an autonomous state, said Charles W. Holman, representative of the United States Food Administration in the Far East during the war, in speaking on conditions in Siberia before the Civic Forum of the War Camp Community Service in Washington recently.

Mr. Holman has recently returned to this country after a stay of 11 months in Siberia and Manchuria, during which time he traversed both countries from Vladivostok to the Ural mountains and back.

Freed from contact with the old order of the czar, Mr. Holman said, Siberia is removed also from the disorganization and chaos that prevails in Russia. The present government, located at Omsk, while provisional, is liberal and sane, and gives many promises that Siberia will be the new Russia of the future.

Mr. Holman's address was given in connection with the series of lectures dealing with foreign political conditions which have been delivered recently before the Civic Forum of the War Camp Community Service in Washington. Continuing, he said:

"The Ural mountains are a natural dividing line between Siberia and Russia. In the crisis of the last two years they have been the barrier between Bolshevism on the West and liberal but sane government in the East. If Bolshevism continues its hold on the Russian people in the West the present Siberian attempt at self-government will gather added strength as time passes.

"Nurtured and fostered under proper influence, it is reasonable to look forward to the formation of a new national entity in Siberia.

"There are approximately 15,000,000 people in Siberia. Of these, 2,000,000 belong to the original tribes. The rest are Russians who have immigrated there with a minor per cent of political exiles among them. In general they are happy in their mode of life, rapidly becoming prosperous, and have quite good business ability. There is plenty of land for all, although it is nationalized; but then it has always been nationalized in Siberia, and the peasant is contented with use and occupancy rather than ownership.

"Their city systems of education are particularly well developed along cultural lines. There are several universities in Siberia, the oldest being at Tomsk with about 6000 students.

"The body of the Siberian people have never favored Bolshevism and are not in sympathy with the political conditions that exist in European Russia. The Russians of Siberia welcomed the return of the Czecho-Slovak army from Vladivostok to the Urals, and large numbers of Russian officers rallied to the support last summer of General Gaida, the Czecho leader, fighting however as independent units under their own generals. Since the Bolsheviki were pressed back, the Siberian people have measurably increased their army, and after some factional attempts to gain control of the provisional government have generally accepted Admiral Kolchak as temporary dictator. They are making strong efforts now to adjust their institutions to a new era of activity based upon stimulation of individual effort along lines of peaceful organization and promotion of trade with the outside world.

"Siberia is looking to the outside world for relief and support at this time. Its people do not want charity. They have a surplus of raw materials to sell. They want assistance from America in rebuilding their economic life. They desire instruction in railroading, in reorganization of education, in stabilizing currency, and advice in the formation and conduct of popular government.

"The Siberian people have already secured the assistance of the Allies in running the railroads. That is an opening wedge for other similar assistance. America has troops now guarding the railroad line that is the key to the economic rehabilitation of Siberia. These troops have been welcome, and their presence, and the presence of other Allied troops serve as a moral support in resisting Red Guardism.

"The most practical way for helping these people at this time is to continue and strengthen the present policy of friendly policing and economic assistance. If this requires more soldiers, they should be sent. There is a high duty falling upon the American people to give assistance—economic or military—which distance does not lessen.

"The Siberian people believe in the idealism of America, but they are restless wherever Japanese armies police their territory. They have not forgotten the Russo-Japanese war, and they fear now that Japan not only desires to obtain possession of the Russian built railroad in Manchuria, but also an economic stronghold on eastern Siberia. A series of unfortunate incidents following the movement of Japanese armies into northern Manchuria and eastern Siberia last summer and fall have agitated the Siberian people and increased their suspicions of Japanese intentions.

The Allied powers may well extend sympathy to the present efforts of the Siberian people. Their cities are growing rapidly—as fast as western cities in the United States have ever grown, and they are superbly located at the junction of rivers and railroads which destines them for even greater development.

Omsk, the present capital, is a great distributing center that, like many other Siberian cities, has more than doubled in population in recent months as a result of the influx of refugees from European Russia. Many of these refugees will continue to live in Siberia.

The foundation stone of a new Russia in Asia is friendly support from outside nations. Unselfishly given, Siberia holds the potential possibilities now a great and prosperous nation in years that are to come.

THE RED TERROR IN RUSSIA

In September, came the culminating act of the Bolshevist government, the manifest of September, written by Carl Radek, the most terrible document of which the brain of man was ever guilty, says Arno Dosch-Fleurot in the World's Work.

I will not attempt to quote it as I have not the manifest before me, but the sense of it was that every workman or peasant was immediately to kill without parley any one whom he suspected of counter-revolutionary tendencies. This threw down every bar, laid the way wide open to personal vengeance, plunder, and anarchy. The death and suffering that has occurred in Russia on account of this sweeping manifest passes all possibility of reckoning. It ended the last bit of justice between man and man in Russia. It turned loose anarchy in a situation filled with hate. It turned every man against his neighbor, made every house a fortress, and assured the deaths of tens of thousands of the only people who could possibly reconstruct Russia.

The actual deaths from the Red Terror must surpass all estimates. By one kind of terrorism or another, the deaths in Russia in the autumn of 1918 must have averaged a thousand a day. As the deaths of the French

revolution from the fall of the Bastille to the beheading of Robespierre was only about ten thousand, the difference is noticeable.

The Terror is having a certain success. It is gradually killing off all the culture there was in Russia, and, if it could go on long enough, there would be simply an aggregation of villages, some at peace, others at war. The cities have steadily disintegrated, and, after a year in power, the Bolsheviki have not one constructive act to their credit. But they are still in power late in November, as I write, and while they remain in power, the Red Terror will continue.

WHAT MARRIAGE IS—AND ISN'T

In most revues and musical comedies a young couple meet in some hotel garden, "fall in love," and are married in the last act, writes W. L. George in Harper's. Charge me not with lack of humor if I suggest that many marriages are so made. In my notebook are several confessions. Among them is that of a young girl who pledged her hand on board a liner because there was nothing else to do. (She was wrong; she could have jumped overboard.) People do marry as casually as they learn to play golf; but they take more pains with golf. In that negligence hides the nightmare that shall haunt them; they blunder into marriage; they think to conduct it without travail or diplomacy into the detachment of mature years. Therein they go astray, for marriage is a tool with many edges, and none shall use it with impunity that treat it without regard. For it may close as many doors as it can open.

That marriage can close doors none should deny, and it is folly to overlook its limitations, notably those which bear on individual freedom. No skill or tolerance can make of marriage a state akin to celibacy, and it is well to agree that the married are not free people in the sense of the unwed; this is not a reflection on the conjugal condition, for freedom is a word, and Silvio Pellico in the Spielberg found wings for his spirit that no Austrian peasant could fasten to his shoulders. To be free is sometimes to be derelict, and as in marriage such dereliction seldom arises, the loss is undamning to the state. But the married must, after the ceremony, realize "that they have this day lit a candle which cannot be put out"; accepting a new condition, they must be ready to adopt new manners, which is not easy when creatures are adult, differently bred and nurtured, perhaps rooted out of dissimilar social strata, even brought together across continents. They must abandon the idea that they may, unchecked, change their dwelling, their occupation, the circles of their friendships; all these things they may still do, but only in consultation. Of if they do not consult, if one imposes upon the other his will or the thrall of a nagging tongue, then shall victory turn as dust and ashes in his mouth.

THE CARE OF THE GROWING CHILD'S TEETH

By the end of the second year the baby should have his milk teeth complete and until the sixth or seventh year, when the permanent set will begin to appear, these teeth must serve all the purposes that the final set will serve later. Since this is the time the child is learning to chew his food, a process necessary not only for proper digestion but for the strengthening and developing of his jaws and for the proper growth of the permanent teeth, it is important to keep the first teeth in the best possible working order. The condition of the teeth is a fair index to the general health of the child.

Until the child is old enough to use a toothbrush himself, the mother should wash his teeth every day; but as early as possible the child should learn to care for his own teeth. If the teeth can not conveniently be cleaned after each meal, the mouth may at least be rinsed. Children should be taught that it is of special importance to wash the teeth and mouth after eating nuts, or any sweet, sticky or pasty food. The teeth should be carefully cleaned at bedtime since the fermentation of food particles left in the mouth, which leads to the decay of the teeth, proceeds more rapidly at night, when the mouth is still.

The child should be taught to brush the teeth from the gum downward or upward toward the cutting edge. When the teeth are brushed crosswise, the tendency is to push whatever is on them into the cracks and crevices of the teeth or under the edges of the gums. The inner surfaces of the teeth should also be brushed up and down, and the grinding surfaces should be scrubbed in all directions; after the scrubbing is finished the mouth should be thoroughly rinsed with warm water.

Some hard food like a stalk of celery or part of a ripe juicy apple eaten at the end of a meal scours the surface of the teeth and leaves a fresh clean taste in the mouth.

Children should be taken regularly to a good dentist once or twice a year after the first set of teeth is complete. If cavities appear they should be filled with soft fillings, and each tooth should be saved as long as possible. If the temporary molars are extracted before the sixth year molars come in, the latter will be apt to crowd forward into the space left vacant, and when the later teeth come they will be pushed out of their regular places, destroying the natural line of the mouth. The first molars furnish the grinding surfaces necessary to proper chewing of the food. If they fall out too soon the child is hardly able to chew hard or tough food, and is likely to swallow such food in chunks.

The care of the child's first teeth is important also because the health of the permanent set is largely dependent upon that of the first set. The second teeth are much larger than the first and consequently need more room in the gum. For necessary development the jaws must be given plenty of exercise. Consequently the child should have a mixed diet, including some hard food which he can not swallow without chewing. Toast, crusts, hard crackers, certain fruits like apples, salad, vegetables and meats should provide the food elements needed for healthy teeth if the child is thriving.

FOR THE CHILDREN'S BASKET LUNCH

1. Sandwiches with sliced tender meat for filling; baked apples, cookies or a few lumps of sugar.
2. Slices of meat loaf or bean loaf; bread-and-butter sandwiches; stewed fruit; small frosted cake.
3. Crisp rolls, hollowed out and filled with chopped meat or fish, moistened and seasoned, or mixed with salad dressing; orange, apple, a mixture of sliced fruits, or berries; cake.
4. Lettuce or celery sandwiches; cup custard; jelly sandwiches.
5. Cottage cheese and chopped green pepper sandwiches, or a pot of cream cheese with bread and butter sandwiches; peanut sandwiches; fruit; cake.
6. Hard boiled eggs; crisp baking powder biscuits; celery or radishes; brown sugar or maple sugar sandwiches.
7. Bottle of milk; thin corn bread and butter; dates; apple.
8. Raisin or nut bread with butter; cheese; orange; maple sugar.
9. Baked bean and lettuce sandwiches; apple sauce; sweet chocolate.

LOVE IN 1919

Ah, the good days of old
When to win a maid's glove
Knights went to the ring
And did battle for love!
How I'd fight if I could!
How my life's blood should flow!
How the huzzas should greet me—
A victor, I know!
But—the year's 1919.
I love her! I wean
I'll hike out and buy her
A washing machine! —Cartoons.

FEEDING THE PRODIGAL

"O father, kill the fatted calf!"
The prodigal, returning, cried.
The old man laughed a scornful laugh,
"Not by a durn sight!" he replied.

"The price o' veal is far too high.
What? Kill a fatted calf? Tush, tush;
But walk right in. Ye're welcome, Si.
Yer ma's jest made some corn meal mush." —Walter G. Doty.

Westclox

IT'S the way you *start* your day that counts. A leisurely, untroubled get-away in the morning usually means a day of many things well done.

That's what a good alarm clock does for you. Millions of men thank their Westclox alarms for smoother-running, more resultful days. They get off to business feeling *right*.

That's because each Westclox does *its* job right. It's built so it will. All Westclox have the same construction that won Big Ben's success.

Wheels turn on needle-fine pivots of polished steel. Friction is lessened. The clock runs easier; lasts longer. Westclox, on the dial and tag, means that kind of a clock.

Belgian hares 14.

LIVE STOCK

The weak condition of the market for beef cattle existing since the middle of April shows no signs of improvement. While several train loads of cattle have gone Eastward to relieve the congestion in Los Angeles its effect as a market stimulant has not yet been visible. Local slaughterers are paying the prices quoted for good steers f. o. b. this city, when this class and grade of cattle is bought, but very few cattle coming into this market will grade up to that quality of steers.

The large markets in the East have recorded sharp declines in prices for beef cattle in the last few weeks, even though the receipts have not been heavy. The bulk of offerings consists of light half fed cattle that does not produce good dressing percentages. The local market receipts are of a medium and inferior grade that does not find favor with anyone.

Hogs appear to be very scarce and prices continue high on all grades. Local killers have reduced their killing quotas of hogs owing to the live price being so high they claim that it is not a profitable investment as the consumer will not pay the price for dressed pork consistent with its cost.

The receipts of lambs are not as heavy as was the case for the past six weeks, Many large shipments have gone Eastward and will continue to do so for another month. Two double decks and fourteen single decks of lambs left San Bernardino last night for Kansas City. Twenty-four decks lambs sold yesterday in Omaha at $18.50 to $18.75, averaging 55 to 65 pounds per head.

The Kansas City office wires that 4000 lambs from California averaging 60 to 69 pounds sold yesterday and today at a price range of $17.00 to $18.35, and the culls at $13.50. Also 1000 shorn ewes averaging 82 to 119 pounds at $10.00 to $10.50. California cattle at Kansas City sold today, 500 head averaging 789 to 932 sold at $10.75 to $12.80.

The local market is firm for lambs, but an undertone of weakness exists for sheep stock.

Omaha wires May 14, 10 A. M., "Three loads California beef steers averaging 1170 pounds sold today at $13.75."

Good steers	12.00@12.50
Medium steers	11.00@11.50
Common steers	9.00@10.00
Good cows	10.00@11.00
Medium cows	8.00@9.00
Common cows	6.00@7.00
No 1 hogs, 175-225 lbs.	19.00@19.50
No. 2 hogs, 250-400 lbs.	17.00@17.50
Feeder hogs	13.00@14.00
Lambs, cwt.	15.00@16.00
Lambs, No. 2, cwt.	14.00@15.00
Wethers No. 1, cwt.	11.00@12.00
Ewes No. 1, cwt.	7.50@9.50

VEGETABLES

These are the actual prices obtained May 13, Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes, doz. .....25@75

Asparagus: Northern, green, extra fancy 9@10½; fancy, 6@8.

Beans: Local Wax 12@13 lb.; Kentucky Wonder, best, 15@17

Beets, doz. bunches 20@25.

Cabbage: Sales to retailers, best, cr. 3.00; poorer, 2 50.

Carloads f. o. b. usual terms demand and movement good, little change in prices. Early Winningstadt, California crates, best 50.00@60.00, mostly 50.00.

Carrots, doz. .....40@45

Cucumbers, bx of 2½ doz. .....2.25@2.50

Lettuce: Sales to retailers, best lettuce in cabbage crates, 65@75

Carloads f. o. b. usual terms—demand and movement moderate, market steady, little change in prices. Best 1.30@1 40.

Parsley, doz. .....15@20

Peas: Local (San Pedro) best, 9@10; northern, 10@11.

Radishes: Round Red 15@20 per dozen bunches. Long White, 40 per dozen bunches. Long Red 25 per dozen bunches.

Rhubarb: Local Winter Crimson, 1.00 @1.10 per packed bx. Strawberry, fy., 1.25 @1.50 per apple bx. Northern Strawberry, extra ch., 2.00@2.45.

Spinach, doz. .....15@20

Squash: Imperial, per 4 basket crate, 75@1.00.

Tomatoes: Quality and condition generally good; Mexico, best 4.00@4.25 lug box; Imperial, 4 basket crates, 3 25@ 3.50.

Turnips, doz. .....35@45

FRUITS

These are the actual prices obtained May 13, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: Yellow Newtons, fy. medium size, 3.50; loose 7@8 lb. Oak Glen, Rome Beauties and Pearmains, 3.75@4.00.

Cherries, northern, supply light, 20@ 25 lb.

Pineapple, lb., 18@20.

Strawberries, 3.25@4.50 per 30 basket crate.

Lemons: Fy. packed, 4.25@4.50; local pack, 3.00@3.50; loose, some tree ripe, 1.75@2.00.

Oranges: Navels, medium and large size, fy., 5.00@5.75; local packed, 2.25@ 3.00; Tangerines, 7@8.

California Wonder Corn

The result of ten years' selection. Produces six times as much as common corn. First prize winner at San Francisco Land Show. Quick and big returns from a small investment. All seed produced from corn bearing 5 to 12 ears per stalk. Grows 10 to 16 feet in height, producing enormous crops of very rich ensilage. Choice selected seed for sale at reasonable prices, shelled, on the ear and stalks with all the ears on them. Our illustrated booklet, giving full history and details of this wonderful money-maker, sent free on request.

E. C. FRAZEE

Corn Specialist

Santa Rosa, Cal.

EARN BIG MONEY

In the auto and tractor business, $100 to $300 a month. Learn in few weeks by our system of practical instruction. All modern equipment. Expert instructors. Free $50 tractor scholarship offer now open. Earn board and room while learning. Write for free catalogue. Shows students at work, tells how YOU can make a big success in this business. NATIONAL AUTOMOTIVE SCHOOL, 802 South Figueroa, Los Angeles, Cal.

The Threshing Problem Solved

Threshes cowpeas and soy beans from the mown vines, wheat, oats, rye and barley. A perfect combination machine. Nothing like it.

"The machine I have been looking for for 20 years." W. F. Massey. "It will meet every demand." H. A. Morgan, Director Tenn. Exp. Station. Booklet 26 free.

Koger Pea & Bean Thresher Co.,

MORRISTOWN, TENN.

Grapefruit: Local fy., 2.25@2.75 bx; poorer, 1.75@2.25.

BEANS

Demand and movement moderate, market steady, no change in prices Carloads f. o. b. usual terms—pool prices, sacked per 100 pounds, choice recleaned basis, Limas 7.50, Henderson Bush 7.00. Warehouse cash to growers—choice recleaned basis, Small Whites best 6.00, Large Whites, sacked per 100 pounds, 5.75@6.00; Blackeyes, sacked per 100 pounds best, 3.00@3.25; Tepary, sacked per 100 pounds, 2.00@2 50.

HAY

Quotations by Nichols - Loomis Company. Following are prices to growers, f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices:

Tame Oat	19.00@24.00
Barley	16.00@19.00
Alfalfa	16.00@19.00

The Alfalfa Growers of California, Inc., 525 Central Bldg., Los Angeles, furnishes the following quotations on alfalfa hay. Below are its selling prices to carload purchasers f. o. b. cars Los Angeles on the new 1919 crop:

No. 1 dairy	26.00
Standard alfalfa	20.00@21.00
Standard alfalfa	20.00@21.00
Stock alfalfa	18.00@19.00

GRAIN

Prices on local Grain Exchange:

Egyptian corn	3.10
Eastern Kafir	3.25
Wheat, mixed feed	45.25
Milo Maize	2.60@2.78¾
Barley	2.60@2.67½
Corn, sacked, No. 2 yellow	3.45
No. 3 yellow	3.40
No. 3 white	3.35

San Francisco Markets

San Francisco, May 13, 1919.

BUTTER

Quotations made daily by the San Francisco wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by wholesalers to producers are eight per cent less.

The quotations on butter are on the basis of solid packed cubes. To ascertain the market price of butter in squares, add to the cubes basis price per pound as follows:

Two-pound squares, parchment wrapped, ½c; 1-pound squares, parchment wrapped, 1c; 2-pound squares in cartons, 1½ to 2½; 1-pound squares, in cartons, 2c to 3c.

Dairy Exchange quotations, lb.:

Fisk Cords—The Wisest Tire Investment

NO part of the motor car has shown more constant development toward better things than the tire; and no part contributes any more to the ease and efficiency of the automobile.

The FISK CORD TIRE, with its sturdy, deep-buttoned non-skid tread, its bigness and its general air of ability to do the work cut out for it, is a distinct step forward in tire building.

It has speed, durability, riding comfort and safety.

Its clean-cut beauty, its long-wearing qualities, its great resiliency, and the protection which its tread gives against side slipping, make it a wise investment to the automobile owner, yielding big dividends in mileage and tire satisfaction.

Your dealer and thousands of others recommend FISK TIRES because they know they are backed by a company to whom "the satisfaction of the user" has always been the first consideration.

(Made also in Ribbed Tread)

"There is now a Fisk Tire for every motor vehicle that rolls"

Protect the Watershed

California cuts nearly a billion and a half board feet of lumber every year. The State has maximum manufacturing and motive power possibilities from its mountain streams of approximately 9,000,000 horsepower. The use of this wonderful energy, greater than that possessed by any other state in the Union, in no way lessens irrigation or navigation possibilities, but all these great sources of wealth are jeopardized by nearly 2,000 forest fires annually. State and nation unite in employing rangers or foresters to protect this wealth; counties and communities unite in organization of volunteer fire departments for protection from field fires. On the part of producers there is general realization of the enormous losses, especially to the irrigationist, caused by fires sweeping the watersheds and lessening the power to retain the winter rains and snow. Most of these fires are caused by carelessness. Pass the word along that the careless camper leaving fires may be suppressed, that the cigarette smoker, gunner and other visitors in national and other forests may become protectors of California's great assets.

Overland
TRADE MARK REG.

"Public Opinion"

The practical utility of the Overland Model 90, shown here, has created a constantly increasing sentiment of approval. In awakening public appreciation to the economical value of the automobile in general, the Overland has played an important part. Over Six Hundred Thousand of these dependable cars are serving their owners efficiently and economically. Model 90 is a car of such attractive appearance and sterling performance that owners everywhere praise its economy and practical value. Public appreciation thus won and expressed is your safe guide in buying a car.

The Value of Watershed Protection

By Arthur L. Dahl

SOIL, sunshine and water are the three elements necessary for successful agricultural and horticultural development. Southern California has millions of acres of fertile soil, an unlimited supply of warm sunshine, and only a fairly good supply of water. If more water were available the garden spots that have made the Southland famous all over the world could be extended and provision made for taking care of the millions of outside dwellers who look longingly upon this favored region and plan some day to live here.

Water is the most valuable asset of Southern California, and every drop of rain that falls on our mountains should be preserved and utilized. With our long dry season, when no rain falls, and when we need the water the most, it is absolutely necessary to conserve and store the winter rains and snows. Artificial or natural reservoirs save but a small portion of the precipitation, but nature has provided a means for holding back the waters that percolate through the soil and seek their way along subterranean channels to the sea.

The forests, or vegetation, have always been the great conservators of moisture, preventing the erosion of the surface and, through a mass of root systems which act as sponges, holding the waters in the ground for long periods and rendering the moisture available for man through live springs, flowing brooks or artesian reservoirs.

In the early days the mountains of Southern California were all practically covered with forests of trees, but gradually, through fires, lumbering and other causes the majority of these forests were destroyed, and there sprung up on the steep mountain slopes a chaparral growth, of no commercial value, but of the greatest use in conserving our water supply. In many ways this chaparral is of more value from the standpoint of water conservation than forest growth, because it grows so densely, and its root systems form such a mat of closely-woven vegetable matter just under the surface of the soil, that the falling rains are held in suspension for a long time, and only escape gradually by percolating through the root systems to replenish the springs that rise to the surface, or else to maintain the water level of our artesian wells. To the extent that this dense chaparral growth can be maintained on our mountain sides will our water supply be conserved.

Fire is the great enemy of the chaparral and constant vigilance is needed in the dry season to prevent its destructive appearance. Chaparral becomes very dry under the continued burning of the sun, and the woody fiber contains a large percentage of oily resins that burn fiercely when once ignited. The federal government has recognized the value of this brush cover in water conservation and practically all of the mountains and foothills in Southern California have been set aside as national forests, supervised and policed by government rangers.

A definite system of fire protection has been worked out, and in cooperation with county supervisors, large water companies and irrigation interests, thousands of dollars have been, and are being spent to maintain permanent trails and firebreaks so that fires, once started, can be quickly reached and easily controlled. Fire fighting tools are cached at various points along the hills so they will be easily available should a fire occur in that vicinity, and every precaution is taken to provide the maximum amount of fighting force with the minimum of delay. But the most important thing is to prevent the occurrence of fires, and in this every dweller or traveler in our mountains should feel a personal responsibility, and be careful to put out camp fires when through, to refrain from discarding burning matches or cigar stumps, and avoiding the causes of brush fires. The careless or thoughtless act of a single individual might cause a fire that will be felt by the water users of a valley many miles away.

Fire-breaks Protect Water Sheds

Showing portion of completed Sturtevant trail which also serves as a secondary fire-break. Angeles National Forest, California.

As it is the function of chaparral growth to form a natural sponge above and below the surface of the earth, the older this growth is the more compact and effective it becomes. When rain falls upon the side of a steep hill the force of gravity will cause most of it to run away along the surface of the ground, and with the merging of many raindrops the speed of the flowing water will increase as it descends the steep slopes. With the increasing volume of water its destructiveness will grow, until the loose soil of the surface will be washed along with the stream and deposited in the beds of the creeks or carried along to the rivers. Where the rainfall is heavy, large rocks are carried along by the force of the water to bring destruction to the lands below, and this erosive force of water will gradually denude the hillsides of their plant nourishing soils and vegetation will be incapable of thriving thereon.

What has been said is true only of barren slopes, for where chaparral grows the destructive forces of falling rains are annulled. Instead of the raindrops beating directly upon the ground they are caught on the leaves and boughs of the plant, the force broken and the water runs slowly down the trunk or drops from branch to branch until it reaches the ground. Here, too, its progress is retarded by the mass of dead leaves and humus accumulated on the surface, and the raindrops must force their way gradually through this accumulated litter before entering the soil. Here again the thick mass of vegetable roots obstruct the passage of the water, holding the soil and acting as a filter for the moisture as it sinks deeper into the ground. On a thickly covered mountain side the scientists of the government have found that it takes days, and often weeks, for surface rains to percolate through the vegetable growth and reappear in springs lower down the mountain. Careful records of water gauges maintained in mountain springs and streams have enabled the government to ascertain definitely the action of rainfall on various types of watersheds, and they are able, after a destructive fire on a particular watershed, to determine fairly accurately the diminution to be expected in the succeeding seasons' water supply.

Rainfall to be of any value to man must be utilized. If all of the moisture produced in a season of light rainfall is saved the results will be better than if only a portion of the fall of an extremely heavy season is preserved. Water which runs away to the sea in surface streams is of no value to the growers, and more likely than not it carries with it the rich silt of the land over which it traveled.

The most striking examples of the value of watershed protection are found in the experiences of China. In the early days of that old country the hills and mountains were covered with tree and plant growth, but gradually, through need of wood, the slopes were denuded until they became absolutely barren of vegetable growth, a condition in which they remain today. When the rains descend upon these barren slopes there is nothing to break their force, and the waters rush down into the streams, flooding the lowlands and rendering homeless thousands of people who lose their all. Famine and pestilence follow in the wake of the waters, and the people of the world are called upon to donate the food to keep the desolated people from death.

If all the chaparral growth on the sides of our Southern California mountains and foothills were allowed to burn up or be destroyed, it would not be long before our beautiful orange groves and our gardens of flowers and foods would die from want of moisture, and the land of beauty and plenty that now attracts the tourists of the world would become as desolate and barren as the land of the Chinese. Nature has clothed the mountains with a garment that will protect them from erosion and conserve the moisture needed in our valleys. All she asks is that man allow it to remain as it is and not cause its destruction through fire.

COTTON CONFERENCE

Call has been issued for a world cotton conference to be held in New Orleans, October 13-16. It is expected there will be present some 3000 delegates from the United States and also representatives from Canada, Great Britain, France, Belgium, Holland, Russia, Italy, Peru, Switzerland, Portugal, Spain, the Czechoslovak Republic, Greece, India, China, Mexico, Japan, Brazil, and Scandinavia

Subjects under discussion will include:

Buying and selling of cotton, with all that pertains thereto.

Growing and handling of cotton, with due consideration of the best methods of insuring long needed improvements in ginning, compressing and standardizing of bales.

Transportation of cotton with discussion of means to put an end to country damage, and to bring about better means for the warehousing of cotton.

World's consumption requirements of cotton, with careful thought for the possible need of a system of apportionment among the nations with which we enjoy reciprocal trade relations.

Means of increasing and improving cotton production in the United States and other countries.

Consideration of machinery needed for replacement and development of the textile industry, especially in France and Belgium, where much time and labor will be required to return it to its old footing.

The part the United States, as a creditor nation, is to play in world readjustment, with special regard to the needs of the future of the textile industry.

Financing and warehousing of cotton, two subjects so closely interwoven that to separate them would be impossible. Special reference will be made in the discussion of this question to the establishment of American warehouses, receipts of which for cotton stored therein will be accepted as collateral for loans, both in this country and in England — "International Warehouse Receipts" they might be called.

Last, and perhaps the most important of all, discussion of international standardization of hours of labor in the textile and other industries, as possibly the only solution of the labor problem.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The cover of this issue speaks for itself through the graphic illustration which brings the snow-clad mountain side into our homes. This photograph was taken in that portion of the state which is not supposed to have any timber in its mountains, and in the usual commercial sense it does not. But these trees have future value and, more to the point, they have present day value in protecting the mountain slopes so that the snows and the rains have much less rapid run-off.

DAIRY COUNCIL

The first annual meeting of the California State Dairy Council will be held in San Francisco July 9. This organization has been formed but a few months but has outlined a campaign of work for a greater consumption of dairy products and appeals to the milk and butter trade and to dairymen of the country to encourage this effort.

DUST THE PESTS

Horticultural Commissioner Kellogg of Santa Barbara County reports excellent success in the control of walnut aphis by use of dust insecticide. A systematic campaign of control has been inaugurated and, so far as can be judged early in the game, it is proving entirely successful. Some growers are combining Bordeaux in order to prevent any fungous trouble. The present year is proving disastrous with various blights or fungous growths. The weather has been favorable to their development.

THE OLD HEN MUST GO

With feed at present prices the down-and-outer of poultrydom must be sent to the block or the profits of the poultry yard go glimmering. It is hardly probable the farmer or poultry man has raised his flock to such quality that his hens are averaging 200 eggs a year, or possibly not 170, or even 160, but to achieve success in these times of war prices calls for attention to the smallest details, and the lazy hen must pass, and quickly, for the larger laying season is now over, and with moulting but a few weeks away and the market for hens fairly good, the block should be liberaly used.

OVERSEAS

The three American airplanes which started for Europe have reached the Azores. The distance covered from the eastern extremity of North America to Europe's western outpost was about 1200 miles, by far the greatest non-stop trip yet made by airplanes. One of the planes was forced to drop to the ocean and made the last portion of the trip on the ocean surface. Another, seriously damaged was towed in by war vessels which were watching over the course. The NC-4 is now ready for the final dash of only a few hundred miles to Portugal.

The flight attempted by Hawker, the Australian, in an English made machine, has resulted in tragedy, he and his lieutenant, Mackenzie Grieve, giving their lives in the effort to make the crossing from Newfoundland to the Irish Coast.

PUT OUT THE FIRE

This will be a pretty good year to follow the plan of putting out the fires before they start. We have preached this doctrine so long that it is becoming trite and possibly even tiresome, but when we consider that 2000 fires annually destroy millions of dollars directly, and a greater number of dollars indirectly, and that practically every one of those fires is started by a human who has been careless, it appears that the preaching must continue. The percentage of fires caused by lightning or other natural causes is so extremely small that it is not worthy of counting, but the number caused by the careless camper causes so much suffering that every Californian, every vacationist, and everyone known to be heading for the mountains should be appealed to to use his influence in educating toward greater care.

POULTRY SCHOOL

Many poultrymen will attend the fourth poultry institute, or school, under the auspices of the state college of agriculture, Los Angeles County farm bureau, Poultry Producers of Southern California, San Gabriel chamber of commerce and San Gabriel Valley Cooperative Association. A local committee of poultrymen has made arrangements for the use of the Mission Play house. Professor J. E. Dougherty will be in immediate charge, and questions covering the range of principles of poultry feeding will be discussed from ten o'clock Monday morning through to a demonstration of chicken pox vaccine, one of the last numbers on the program in the week of school.

The management hopes that every poultryman attending will bring notebook and be on hand early Monday morning for registration. These poultry schools have been held in various parts of the state and have been very successful.

RIVERSIDE

Many a fruit grower will make an early Monday morning start with trailer and camp equipment for Riverside. This is next Monday, May 26, the opening day of the great convention. Riverside tells us that her beautiful park is open for these campers with all kinds of free privileges, including free wood, lights, free bathing and free boating, in addition to free admission to a great six-ring convention.

Some of the country's best authorities in matters cultural and scientific will make Riverside their headquarters next week. It is one of the greatest weeks yet offered California growers.

AGRICULTURAL EXTENSION

Farm bureau people are planing to make a campaign as soon as congress shall convene for correction of the mistake of the last session in not making appropriation for continuance of the work provided for under the Smith-Lever agricultural extension bill. Vast changes will necessarily be made in many of the activities of the United States department of agriculture unless this oversight of the former congress is corrected. The funds which have been appropriated for the work of the department will be exhausted by June 30. The bill to provide funds for the coming year was before the last congress but was filibustered out of existence and the beneficial work of the department jeopardized. Now the call for congress to convene gives opportunity to correct the error, providing quick work is done once the session is opened.

The principal concern of the farm bureau people is not only that an appropriation shall be made but that a sufficient appropriation shall be made. As a war measure agricultural extension work under the county farm agent was given funds far in excess of the maximum amount contemplated by the Smith-Lever extension act, and this excess appropriation is needed to continue the farm bureau work. Its members are hoping that for at least a few years this larger activity may be encouraged by congress and ask that congress take instant action.

Interested farm bureau people are writing congressmen and senators at Washington.

IT PAYS TO ADVERTISE

Last year Tillamook, one of the smallest counties in Oregon, spent over $5000 advertising Tillamook cheese in the city of Los Angeles. As a result the demand for that particular cheese has been such that the same little county now contributes through its dairymen and cheese factories $18,000 for an advertising campaign in various coast cities. The California state council is now pushing a campaign for advertising dairy products in general and will probably appropriate several times over the amount now being used by the Tillamook people.

One step in this campaign is the issuance of a brochure by the California Dairy Council, which affiliates with the National Dairy Council. The slogan on the title page of this attractive booklet is: "Milk is Indispensable to Good Health." Some 30 pages follow, giving scores of reasons why milk should be a greater factor in the diet, not only of the little ones but of all humans. The suggestion is made by the booklet that because of the great reduction in the dairy production of the country during the past year—less by 9,000,000 pounds than the previous year—there must be encouragement for the dairyman in order to secure greater production to meet the real needs of the country. So-called substitutes are finding greatly increased sale—this because of great sums invested in advertising.

Fortunately, the council and others pushing for an enlarged advertising campaign talk to believers in advertising. For example, one of the largest magazines in America in its April issue carried five full pages of advertising of California farm products, placed by cooperative organizations of producers. The advertisements were in color and probably cost in the aggregate somewhat over $50,000 for insertion in that one issue. They were placed by the California walnut growers, orange growers, lemon growers, peach and raisin growers. The dairymen are next door neighbors to these advertisers and have absorbed the advertising spirit.

VOLUNTEERING

The boys are coming home by the thousands, and the war department is offering every inducement to other thousands to join the regular army, the navy or the flying corps in the building up of the standing army of this country. Every large town now has its recruiting officer, and some boys who formed a liking for military life are doubtless taking their honorable discharge from the Guards or the American Expeditionary forces and immediately signing up with the government for permanent war work. There will be need of many thousands of soldiers in Europe and Western Asia, and it now appears that America is to have a hand in supplying a number of these troops which will have police duties to perform.

A LIVE FARM BUREAU

One county of California will watch with much interest the census returns during the next year to learn as to whether she holds first place in the production of crops. Los Angeles County has held the record for the past ten years as the producer of greatest value in her crops of any county in the United States. For a few years all agricultural sections of the United States have produced to their limit, so far as possible with labor shortage that has prevailed. Los Angeles County is no exception save that her crops being largely orchard crops there has been little opportunity for pronounced increase. However, through intercrops and other intensive methods, as advised by a live farm bureau, every possible advantage has been taken of opportunities.

The directors of this farm bureau met recently at a luncheon to celebrate some of the accomplishments of the past two years and to bid Godspeed to the retiring farm adviser, Dr. Coit. Dr. Coit returns to his former work at the head of the department of citriculture and semi-tropical fruits of the University of California, which position he was permitted to leave because of great reduction in number of agricultural students at the university, the boys practically all going overseas. They are now returning, and on June 1 the former farm adviser will be at the head of his department at Berkeley. He will, however, return to Los Angeles for the summer school.

At the luncheon the directors frankly expressed themselves in the matter of Dr. Coit's successor. Robert W. Hodgson, formerly assistant of Dr. Coit in the university work, and also his assistant in the work in Los Angeles County, was recommended by the directors, and the hope is that Professor Crocheron will appoint him to the office.

Sure it is the leaders in the county work have the support of a directorate thoroughly patriotic and alive to agricultural needs.

Science vs. Fertilizer Practice

From an Address by Professor Chas. B. Lipman at San Bernardino Citrus Institute

Scientists who have been making studies of soils admit today that the problems which confront them loom larger than they did years ago when there was less real information as to chemistry, and especially the chemistry — and physics—of soils. As we heard a speaker remark in one convention: "We have found it necessary to unlearn many of the things we formerly believed to be true." Even a few years ago it was a common belief that by the merest chemical analysis of soils and the application of a few chemicals improper soil conditions could be corrected; today the physicist is recognized as an important factor, perhaps even more important than the chemist, and the uncertainty and lack of absolute knowledge in many particulars was never more evident than at the recent citrus institute at San Bernardino. But the attitude shown, that of seeking for more positive information and admitting that present knowledge is inadequate, is most encouraging.

Some of the addresses given at that time have been reprinted in former Cultivators. Professor Chas. B. Lipman of the University of California made an address on "Science vs. Fertilizer Practice". It was far too long to reprint entire, but the larger portion of it, as Professor Lipman expressed it, clothed in language for the novice in soil chemistry, we reprint. This is in the form of dialogue and shows, we believe, wherein science may be somewhat against present fertilizer practice but wherein we hope ultimately it will be in complete harmony with practices which shall be followed. But this cannot be until there is more general education, for there are a thousand and one conditions confronting producers in different sections, and science and practice as used by the farmers must conform to those conditions.—Edit.

SINCE the subject which I have tried to discuss for you is very complicated and difficult for the layman to grasp, I hope you will indulge me if I repeat some of the things which I have said so that you may, perhaps, more clearly grasp the situation. For that purpose, I have decided to put before you an imaginary dialogue taking place between a citrus grower, Mr. A., and a modern soil expert. The dialogue follows:

Mr. A. "I have a twenty-acre orange grove in a certain district near San Bernardino. I would like to fertilize it. What fertilizer had I better use, in what quantities, and when should I apply it?"

To be absolutely honest, the expert must reply, "I cannot tell you, since there is no real scientific basis for fertilizing soils at the present time."

Mr. A. "I thought that was accurately known long ago. Can't you analyze my soil and tell me on that basis what fertilizer to use?"

Expert. "It seems to be the common impression that the exact relationships between soils and fertilizers are scientifically known, but that is not the case. Moreover, soil analysis has little or nothing to do with the case."

Mr. A. "What, then does the chemical analysis of a soil show?"

Expert. "If properly carried out, it shows what chemical composition the soil possesses, but nothing as to whether or not the constituents in the amounts determined are usable by plants."

Mr. A. "By usable, do you mean available?"

Expert. "Yes, in the broadest and most comprehensive sense."

Mr. A. "Then, is there no method for determining the available chemicals in a soil?"

Expert. "None that has yet been found reliable and exact enough."

Mr. A. "What is the difficulty in the way of so doing? Can't the chemist develop a good method?"

Expert. "There is no great difficulty in that respect from the chemist's standpoint. The method of analysis of the soil extract now available, or one which can be arranged easily will doubtless suffice for that purpose. But there is a real difficulty in the way of using such analysis for the purpose in question."

Mr. A. "What is that difficulty?"

Expert. "A soil is not a homogeneous mass, or, in other words, it is not of the same nature throughout a field. In fact, it may show marked variations in chemical and physical nature within distances of a few feet, or even of a few inches. Hence the soil extract obtained from one sample or even from a composite of several samples does not represent the true condition, or the average condition, of a field, no matter how small. But that is not the only difficulty in the way of appraising even the chemical value of a soil through an analysis of the soil extract. The soil and the moisture it contains constitute what to the scientist is known as a dynamic, as distinguished from a static, system. By this, we mean that it does not remain the same constantly, but, on the contrary, changes constantly. Moreover, the changes may vary greatly, due to variations in the intensity of temperature, evaporation from the soil, evaporation from the plant, and perhaps several other environmental factors. In addition to these effects of the climatic complex on the variability of the soil solution, we have others of great moment. Every farm operation may affect markedly the concentration, or even qualitative nature, of the solution. Tillage, irrigation, and rainfall, may do it markedly, but green manuring, ordinary manuring, or fertilizing with commercial fertilizers will do it much more markedly. You must, therefore, see that when one analyzes a soil extract, he merely obtains a picture of the approximate condition of the soil solution in that particular sample of soil at that particular moment, but not of the condition of the whole field at different seasons or even different days within a given season."

Mr. A. "Is there any set of circumstances in which an analysis of the soil extract may be of immediate practical value?"

Expert. "Yes. For example, when the soil extract shows an absolute lack of a certain essential element or an exceedingly small quantity thereof, we know that the soil solution needs enrichment in that respect. But there, again, we have a very difficult problem, because the addition to the soil solution of the missing, or deficient, essential element does not necessarily result in the desired enrichment with respect to that element. In fact, it frequently happens that it does not result in that manner. And yet the addition of the desired element may, and it frequently does, enrich the soil solution in some other element by its chemical effects on the solid soil particles. It not infrequently happens, therefore, that one may be obliged to add some magnesium or calcium salt to the soil in order to set free more potassium in the solution, or vice versa. Such extreme conditions as those in which an essential element may be wholly lacking from a soil solution are not frequently found, if ever, but a very great deficiency in any element may frequently be found in soils. Under California conditions, I have found this to be true for iron and at times for nitrogen, but not ever for other elements. This does not prove, however, that such conditions do exist here for the other elements."

Mr. A. "Then may I understand from your statements that the soil and plant problem is so complicated at present that no scientific rules for soil management, in the true sense, can be recommended?"

Expert. "That is exactly what I mean to say."

Mr. A. "Do you mean to say, also, that the scientist has learned nothing about the relations of soils and plants during the last 60 or 70 years?"

Expert. "I certainly do not mean to say that. Why the very fact that I can answer your questions as I have is an indication that the progressive students of soils and plants have done the hardest kind of work in order to learn how to study their problem. Oh no, we know a great deal about the relations of soils and plants. So much indeed that we are now, for the first time, impressed with the magnitude and difficulty of the domain which still remains unexplored, and with our utter inability to apply what we have learned at this stage of investigation, except negatively."

Mr. A. "Have the several 'long time' fertilizer experiments carried out at different stations in this country and in other countries given us no information of use in connection with fertilizing soils?"

Expert. "They have given us some information of value to the science, but very little, if anything, that is applicable to any specific fertilization problem on any ranch. There is not a single fertilizer experiment of which I have knowledge, which in the first place, was planned correctly enough to enable one to determine the error to which the experiment is subject. Most of them have not used enough control plots, and none of them have either used repetitions of the treatments as well as of the control plots or distributed the latter properly. In spite of all that, however, some of these experiments do actually show that fertilizer treatment in certain ways is unquestionably responsible for bigger crops than no fertilizer treatment. But, they show that only for that particular plot in the first place. Secondly, they do not show which fertilizer combination is the best. Thirdly, they do not show what amounts give the best results. Fourthly, they do not show what is the best time or times of the year to apply fertilizers for maximum results. Fifthly, they give no indication if the same fertilizers used once in two or three or five years are better or less effective than it applied every year. Lastly, and this is the most important practical point, they have never shown profits from fertilizer use as indicated by a correct statistical study of the experiment. All of the work done has never, until recently taken up by me and one of my associates, been studied statistically to determine what true significance, and not what apparent significance, attached to it. Of all the fertilizer experiments which have been and are being carried on, those at Ohio are the only ones which have used enough check or control plots to permit of a reliable appraisal of their significance, and there, as above indicated, they did not replicate their treatments.

Mr. A. "Do you think that we shall ever know how to apply the results of scientific studies on soils and plants to soil management, as regards fertilizer practice particularly?"

Expert. "I would have to guess to answer that question directly, and guessing is not science. As one man to another, however, I may add that I have every hope that we shall be able some day to apply the results of our investigations to the control of crop growth in fields."

Mr. A. "As one who has thought more about soils and plants, studied them more, and seen them under all sorts of conditions, can you suggest a purely practical way for us to determine what fertilizer to use?"

Expert. "The only suggestion I can make on that point is that you try out the fertilizer under properly controlled conditions. The treatment should always be given on a rather large tract, say five or ten acres, and a control untreated plot on what appears to be similar soil conditions should always be allowed. The results of the harvest on these two large plots will show whether or not the fertilizing has paid when all the costs are calculated."

Mr. A. "Such a suggested method, however, allows only for testing one kind of fertilizer. Does that suffice?"

Expert. "No, it does not. Any simple, or any mixed, fertilizer might work well on any given tract of land, and therefore, any of them may be tried. Moreover, the time of applying a fertilizer, and the amount applied, particularly the former, may make the difference between good results and no results at all."

Mr. A. "Is there any general recommendation that you can make along this line for citrus lands in Southern California?"

Expert. "I think it is always safe to recommend the use of as much organic matter as possible. There is probably no doubt that no year should be allowed to pass without at least one cover crop, all the yard or stable manure that can be obtained cheaply should be used, and bean straw, and alfalfa hay if it can be obtained cheaply, should be used in addition. Besides, it is generaly true that some nitrogen fertilizer, preferably sulphate of ammonia, among the minerals, or any organic fertilizer, may be used in small quantities, say 20 to 30 pounds of nitrogen per acre."

After all this, I cannot but admit a sense of failure which pervades me in the task which I have undertaken, that of rendering clearer to you the fertilizer situation. The staggering proportions of the unknown render it peculiarly difficult to clarify the relatively small domain of the known. The subject is so extremely intricate, so complicated, and so difficult that even for those who have given it years of time and constant thought, it is still a puzzle, and yet I have had the temerity to try to explain it to you in a brief paper. I cannot but feel that these remarks are too fragmentary and perhaps too technical to be of much service to you, and yet I have tried to put them in as simple a fashion as my humble powers would allow. Underneath an intensely critical attitude, however, I am filled with much optimism for the future of soil science and the future of soil management. Perhaps if this optimism should steadily prove itself to be justified, I shall have something more than fragmentary, something less technical and more useful to tell you about in the future.

Agricultural News Notes of the Pacific Coast

Northern California

Shasta County wool growers are selling wool at 45 cents.

Lincoln, Placer County, has turned water into its rice fields.

Sacramento contemplates a motor express to run as far north as Red Bluff.

The strawberry crop of the state this year gives promise of being the biggest ever.

The Napa County farm bureau will hold meetings at Mt. George, May 24; Chiles, 27, Union, 28.

Meetings of the Eldorado County farm bureau will be held at Union, May 23; Kelsey, 27.

Grass Valley, Nevada County, farm bureau is arranging dates for fat stock sales through the summer.

Professor R. H. Taylor of the University of California has been made farm adviser of Butte County.

California asparagus sold recently in New York City markets at as high as $8.00 and $12.00 per dozen bunches.

The California Tomato Growers' Association and the Vegetable Growers' Association have merged organizations.

The Northern California Counties Association is pulling for extension of good roads and discussing irrigation matters.

The first carload of cherries from Sacramento went out on May 8. It was shipped by the California Fruit Distributors.

Plantings of cotton will be made next year on the red lands near Oroville, is the announcement of the American Farms Company.

Colusa County Squirrel Inspector Barton is managing a clean-up campaign on ground squirrels. The farmers are cooperating heartily.

Owners of stock in the district of Sutter County that was flooded last winter are warned by the county veterinarian to keep a sharp lookout for anthrax.

Pear growers are watching their orchards closely to detect the first appearance of pear blight that affected branches may be removed and destroyed immediately.

It is announced that all creameries in the San Joaquin Valley from Bakersfield to Merced have become members of the San Joaquin Valley Milk Producers' Association.

B. B. Meek of Oroville has been appointed by the California Olive Association to take charge of a campaign to secure an increased tariff on olive oil and other olive products.

Meetings of the Tehama County farm bureau will be held at Los Molinos, May 26; Proberta, 28. The work of the month will have largely to do with starting a community program.

Sacramento Valley rice growers have word from the food administratin that in all probability the price of $4.32 which prevailed last year will continue during the coming season. This for paddy rice.

The annual meeting of the Almond Growers of Orland was held recently. There are over 40 members. The following officers were elected: President, P. D. Bane; vice-president, A. E. Lindstrom; secretary and treasurer, Dan Sturm; delegate to state exchange, Dan Sturm; directors, P. D. Bane, A. E. Lindstrom, George Sturm, T. H. Hilliard and Mrs. E. O. Royce.

Central California

Cantaloupe buyers are busy in the cantaloupe growing sections.

Kings County farm center meetings: Stratford, May 26; Oakville, 31.

Grasshoppers have destroyed 50 acres of vineyard and orchard in Tulare County.

The San Joaquin Valley reports many sales of lands which are to be planted to raisin grapes.

Stanislaus County irrigators are fencing ditches and canals so as to use inclosure for sheep pasture.

Stanislaus County Farmers' Union recently met and heard reports from the national meeting at Denver.

Many fruit growers believe that dried apricots will reach 20 cents; prunes, 10½; peaches, 15; raisins, 8.

Kings County raisin growers will pack their own raisins this year and they will go out under Kings County brand.

Live stock men of Paso Robles and other sections of San Luis Obispo County will raise a greater number of draft horses.

The Stockmen's Protective Association held its annual meeting and banquet at Livermore, Alameda County, on May 3 and 4.

Water users of Merced County are organizing a small irrigation district, it is alleged, to escape being included in a much larger district.

Kings County fruit growers have sold canning fruit: Elberta peaches, $45; Lovells, $40; apricots, $60; Muscat grapes, $25 to $27.50.

A very successful flower show was held at Gilroy, Santa Clara County, on May 3. Special features were made of wild flowers, hot house plants and roses.

The California Peach Growers', Inc., have named prices on the 1919 output of Practically Peeled brand: Per case of 11 ounce cartons, $6.25; two pound, $8.50.

The Lodi Sentinel reports 60 per cent almond and pear crop, but that the outlook for apricots, apples, cherries, peaches, prunes and plums was never better.

May 24 is Sunsweet Day, to be celebrated at San Jose with great pomp and parade. The day is set apart to spread knowledge of the value of the California prune.

The plans for the construction of a five million dollar meat packing plant at Sacramento are being pushed, and it is hoped a great plant for California producers will be erected there.

Two big dairy ranches were transferred recently in Merced County near Los Banos. A. A. Souza bought a 154-acre tract for $77,000, the other, 158 acres, going to A. J. Alevedo and J. R. Oliveria for $71,100.

Fourteen counties of northern and central California have united in the "Fourteen Counties Protective Association." One purpose of the association will be to secure control of vast acreage and prevent it from falling into the hands of aliens.

Many Stanislaus County grain growers are using caterpillars to bring their grain in for shipment. They hitch on about four trucks and handle about 250 sacks at each trip. Outfits of this kind have been quite common on the streets of Turlock the past week or two since the market revived to some extent.

Southern California

The telephone patrons of Riverside County are wrathful over increased rates.

San Dimas, Los Angeles County, is just finishing its navel season, having shipped 800 cars.

Los Angeles County has the largest sardine cannery in the world. It employs nearly 1000 hands.

The farm bureaus of Chino and Ontario wil unite in a campaign to secure more general planting of windbreaks.

Directors of the Southern California fair held at Riverside are asking the supervisors of Riverside for increased financial support.

Riverside, Imperial and Orange Counties are contemplating uniting in the construction of an inter-county tuberculosis sanitarium.

The Palo Verde section of Riverside County raised 13,672 bales of cotton in 1918. The first commercial plantings were made in 1911.

Yucaipa, San Bernardino County, now has 3300 acres planted to apples, the bearing portion of which promises exceptionally fine crop this season.

Navel orange shipments from Upland this season will total 1700 cars. Manager Myers of the exchange says the returns will be approximately $2,500,000.

Manufacture of potash from kelp has been suspended along the southern coast as the value of potash has dropped back to normal since close of the war.

Orange growers of San Dimas and North Pomona are considering the formation of a new exchange from a portion of the present San Antonio Exchange district.

Members of the Anaheim Fruit Association recently held all day picnic, enjoyed fine lunch and added 54 new members to the roll. The membership now numbers 217.

The labor situation in the Imperial Valley has been serious for some time and now teamsters and others have united in an organization which proposes to still more complicate the situation as to workers.

The federal department of agriculture says that there will be a shortage of sugar beet seed for next season's planting unless arrangements are made promptly by sugar factories, as the European countries which did not plant during the war will now be in the market for heavy supplies of seed.

Imperial Valley cantaloupe growers are conferring with inspectors, ordering supplies and making general preparations for a great cantaloupe shipping season. Nearly 15,000 acres are planted in the valley. The season will last about 50 days. In harvesting this year "half-slips" will be abolished entirely.

Dairymen of Riverside County have organized as a branch of the Southern California Milk Producers Association. Officers of the new association are: D. W. Thomas, president; J. T. Crimmins, first vice president; J. E. Cook, second vice president; R. E. Nebelung, secretary; board members as follows, Mark Worden of San Jacinto, M. O. Pulliam of Ethanac, George Thomas, M. E. Goodereau, J. H. Paulin, J. E. Wherrell, Bert Kenedy, W. F. Eldridge and H. O. Webber.

The Coast and General

Sugar beet planting in Utah entirely finished.

Spot cotton, New York City market 28.75 cents.

Georgia reports material increase in watermelon acreage.

Louisiana is shipping string bean to northern markets.

Texas will grow 20,000 acres of watermelons this year.

Orange Pruning Important Subject

By J. S. Soule

AS AN experienced tree builder, the writer here gives a few fundamental facts and offers a few thoughts on one of the most vital questions confronting the orange growers.

The object in pruning a fruit tree is to put it in proper physical form and healthy condition for the purpose of securing the best quality and most profitable crop of fruit and to prolong the fruit bearing life of the tree.

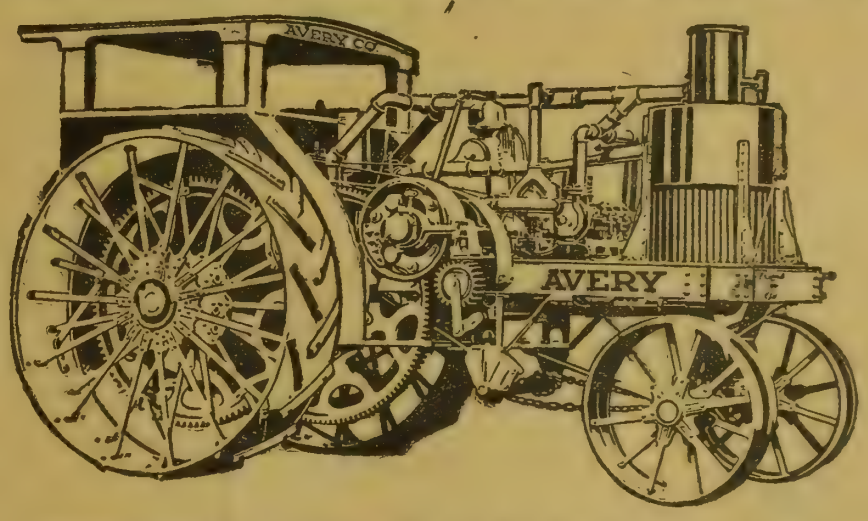
Of all the fruit trees the orange seems to be able to stand the most neglect during the first few years and still produce abundantly, but such treatment is to the detriment of the tree and at the expense of the owner in after years.

Train up a tree in the way it should grow, and when it is old it will not depart from its fruitfulness—if carefully looked after by an experienced tree builder. But you must have healthy nursery stock to build on. You can no more make a good tree out of inferior stock than you can a thoroughbred horse out of a common, half starved scrub colt. Begin right, and then keep right.

To do the work intelligently it is of the utmost importance that the tree builder understand the construction of the tree and what its different parts are to perform. For instance, it is well to know that the stem or trunk is composed of five distinct divisions, viz.: heart wood, sap wood, cambium, new bark, and old (outside) bark. There is scarcely any life in the heartwood; it is simply the bone, so to speak, and adds strength and rigidity to the tree. The sap wood is that through which the water, absorbed by the roots, by capillary attraction passes upward and outward to the leaves of the tree. This water carries the minerals taken up from the soil and is mostly evaporated and passes off into the atmosphere. The minerals carried into the leaves are there converted into plant food for the nourishment, growth and fruitage of the tree. Now an important fact the writer wishes to here emphasize is that sunlight and air are absolutely necessary for the manufacture of this plant food. The healthy leaves of the tree contain millions of microscopic particles, called chlorophyll bodies, which when the sunlight and air acts upon them produce a chemical action that changes the minerals into plant food. This plant food, composed mostly of starch and sugar, then passes down through the cambium wood to the various parts of the tree where it is assimilated by the healthy tissues. Therefore the writer will again call attention to the very significant fact that the conversion of minerals into plant food cannot successfully take place in the dense shade of a tree.

Away from its nativity, and under artificial methods of culture as grown in Southern California, the orange tree has a habit of sending upward a growth of rank shoots. These are generally called "suckers" for the reason that they will absorb and rob surrounding sister branches of much of the life giving elements that belong to them. If permitted to grow these lusty "suckers" will produce a dense, shady inner portion of the tree, shutting out necessary sunlight. Then follows decline and death to many of the robbed and smothered branches. To still further aggravate this condition, each annual growth, with its weight of fruit, bears heavily down upon and covers up that of the year before. Thus generation after generation the outside branches overlap the dead and the dying. Neglect of feeding and cultivation will increase this deterioration; but no amount of feeding and cultivation will ever bring back to life the dead and the dying.

Now in view of these fundamentals the logical conclusion of the intelligent orchardist must necessarily be that the knowledge and skill of the experienced tree builder is indispensable.



To those who are setting out young orange trees we will repeat: begin right, and then keep right.

Orchardists who have not the time or qualifications to do the work themselves should secure the services of an experienced tree builder to look after the setting of the young trees in the ground and then stay with them for a few years at least. Where a single orchard is not large enough to require all the time of the tree builder, two or more owners can club together for this purpose. Then good, healthy nursery stock should be selected, budded from the best of fruit bearing trees. At planting is the time to begin to direct the tree aright by a proper arrangement of its main structural branches. These branches should be selected at equal distances around the main stem and a few inches from one another along the central axis of the tree. These structural branches should consist of from three to five of about equal size. A head thus formed is almost proof against splitting. The experienced tree builder will direct the formation of the tree by skillful disbudding and pinching. At the beginning of the second season the main body branches should be permitted to grow not to exceed three lateral branches and always several inches apart. This should be followed from year to year, only that the number of laterals should be reduced annually. Where a tree is thus judiciously built up there will be but little use for the knife or shears, and but few wounds to heal, and it will come into fruit bearing in good form, and the cost of the tree building will be many times paid for.

But how about the older orchards that have not been properly attended to and are in all stages of decline? This is a problem that is greatly troubling hundreds of orange growers in Southern California. Mistakes of the past are now costing them dearly, and the work now becomes corrective as much as possible. In this attempt much "butchering" has been done, making the last condition worse than the first. Large limbs have been roughly sawed off, leaving stubs to rot and carry decay into the heart of the tree. Limbs have been stubbed back regardless of where the cut should have been made; cut back in the middle of the space between buds or small branches, causing the end of the stub to tassel or die back to the bud or limb. In many cases the center of the tree has been cut out, fruit bearing wood and all, leaving it in a vase or cup shape, and the remaining branches in an overlapping, matted, shady condition, permitting but two narrow fruit zones, consisting of the extreme outer and inner sides of the cup shaped tree. The work of the intelligent, experienced tree builder greatly differs from this. He works with the object of retaining the health of the tree and making every branch throughout its entirety fruit bearing. This is accomplished by forming all of the tree into both a semi-sunlight and semi-shade condition; thus avoiding sun scald and supplying sufficient air circulation and sunlight to all the leaves to enable them to perform their natural function in chemically changing the minerals into plant and fruit food. Such a tree builder will always make smooth, short cuts, and he will not leave stubs to finally carry decay into the vitals of the tree. A tree thus formed will have its fruit

TYPE Y OIL ENGINES

MAKING WASTE LAND PRODUCTIVE

THE FIRST NATIONAL BANK
SANTA ANA, CAL.

May 3, 1919.

Fairbanks, Morse & Co.,
Los Angeles, Calif.

Gentlemen:

We are in receipt of report on a test made on our two 50 H. P. Type "Y" Semi-Deisel Oil Engines, which were purchased from you some two years ago, and we believe this report will be as interesting to you as it is to us.

These engines were installed for us on our property at Cantil, California, which is 25 miles North of Mojave in Fremont Valley, and are used for pumping water for our large acreage in that locality.

Mr. Van Winkle, our Manager, reports that he made a careful test, particularly on the No. 1 plant, during a nine day's run, and found the fuel consumed to be on the basis of 3-1/9 gallons fuel per hour. The fuel used was about 29 gravity and is purchased from a refinery at Bakersfield, being the low grade fuel which you recommended us to use.

The lubricating oil used during this nine day's run was approximately 1/4 gallon per hour.

The above refers entirely to the No. 1 plant which is using practically its full horse-power and which, during the entire test, operated perfectly.

We operated the No. 2 plant at the same time which is using some less horse-power and found the fuel consumed to be proportionately the same.

These plants are being operated by unskilled mechanics and from our experience of the engines operations we can highly recommend their use to anyone who is looking for the highest degree of satisfaction with oil engines.

Trusting that this matter will be of as much interest to you as it has been to us, I am

Yours very truly,

AJO:D

Owing to cancellation, we have to offer Two Thousand Valencia, One Thousand Eureka Lemons and Five Hundred Grape Fruit to caliper three-fourths of an inch and up.

The bud-wood of this stock has been very carefully selected.

We have also Two Thousand Valencia and One Thousand Eureka Lemons, caliper one-half an inch and up from California Fruit Growers Exchange buds.

Walker-Hubbard Nursery Company
First National Bank Building San Fernando, California

evenly distributed throughout its branches, inside and out, and carry a larger amount of fruit, and will not have to be supported by the usual expensive method of propping.

JUNE DROP

At a recent meeting of the Los Angeles center of the county farm bureau Dr. J. Eliot Coit, farm adviser, discussed from practically all standpoints the matter of Washington Navel June drop. This abnormal dropping of oranges, and sometimes prunes and other fruits, was so serious as to cause loss of many millions of dollars to growers of California in 1913. It is a trouble which affects Washington Navel orchards in all sections, especially in the hotter dryer valleys. Nearer coast sections have never been so seriously affected. The trees may blossom heavily, may set fruit which grows to size of peas or even hickory nuts, when suddently they begin to lose their luster, turn yellow, and drop. Formerly the trouble was alleged to have been caused by the usual June hot wave, and the dropping, which may occur four or five days after such extreme heat which sometimes comes after a long cool spring, is definite proof that the heat and aridity have large place in the cause of this trouble. However, the trouble has been investigated from other standpoints, and Dean Hunt of the agricultural college detailed Professor Coit and Mr. Hodgson to make investigation. A detailed and valuable publication has been issued by the university press giving of their findings. Dr. Coit in his address referred to three things which doubtless have to do with the trouble. First, the weather conditions, which have been referred to; second, to a smaller extent, lack of irrigation, or moisture at the roots; and lastly a fungus known as Alernaria citri. In this last mentioned trouble the fungus is the same as that which causes the black navel or navel rot which sometimes does not appear until the fall or toward ripening time. The effect of the fungus trouble does not cause a premature drop but results in the navel rot instead. It is not known to affect any other orange than the Washington Navel. There is no spray which will in any way save the fruit from this fungus, although several experiments have been made in this respect. About the only remedy suggested for handling this trouble is to give best of cultural conditions, optimum moisture in soil, with culture to give proper growing conditions so that tree can readily gather needed moisture when extreme heat wave increases transpiration through leaves. During the last couple of years it has also been suggested that material aid might be given the trees through a strong growth of cover crop either of buckwheat, cow peas or other summer legume, thus shading or keeping soil in better condition. The cover crop must, however, not be used unless there is sufficient water for both trees and cover crop. Pruning is another remedy suggested. Where the tree is carrying a mass of needless foliage the additional leaf surface makes vastly greater evaporation, hence much greater demand on the roots for more moisture. If the hot wave may be anticipated by a few days in this pruning it is probable much fruit may be saved. Another condition which aids in preventing the trouble is an abundance of vegetable mater in the soil or at least sufficient nitrogen for the use of the trees.

FLOUR PASTE AS A SPREADER

O. E. Bremner, horticultural commissioner for Sonoma County, furnishes through the News Letter directions for the use of flour paste for more effective spraying for many fruit pests. He gives the detailed directions for the preparation of flour paste as follows:

The object of the flour paste is to form a body for the spray materials which do not spread easily or which have a tendency to settle in the tank or run after being placed on the foliage or fruit. We find that the flour paste prevents all of these. It causes lime-sulphur or Black Leaf "40" to spread readily; it increases the covering and sticking quality of arsenate of lead and sulphur pastes. In fact, we advise it in all these cases. Care must be taken, however, not to use it too strong as it is apt to cake on the foliage and may, in damp climates, produce mould. For that reason we advise the commercial flour paste, using from six to eight pounds to the hundred gallons. This commercial flour paste is a jelly-like substance and is handled by most paint stores. It is used principally by bill posters and paper hangers. It is cheaper to buy it in this form than it is to make your own. (Costs from two to three cents per pound.)

If the commercial product is not available, flour paste may be made as follows: Carefully sift three pounds of wheat flour and mix into a thin batter with cold water; boil for at least ten minutes or until clear, being careful not to allow it to stick. This should be strained into the spray tank and is sufficient for 100 gallons of water or is equal to six pounds of the commercial paste.

A little better quality of paste may be made by adding one ounce of nitric acid to the water with which you mix the flour. It will be found that the paste will not stick so badly in cooking but will require longer (about 20 minutes) to cook. We sometimes add a bar of ivory soap to the flour paste, especially when it is used as a thrips spray. We have found that the flour paste as given above in conjunction with one-half pint of Black Leaf "40" to each 100 gallons gives perfect success in cleaning up both the adult and larva of the thrips.

CALIFORNIA NURSERYMEN

The association of California nurserymen will hold its eighth annual meeting at Riverside next Monday and Tuesday, May 26 and 27. In addition there will probably be business sessions during other days of the week, for presumably the nurserymen will remain during the great convention week.

President Max J. Crow will preside and make annual report as to the transactions of the association Monday afternoon at 1:30. There will be addresses by A. D. Shamel, "Bud Selection"; Prof. W. L. Howard

THE ACTION OF HUMUS IN THE SOIL

By R. R. Snowden

AT the present state of agricultural knowledge it must seem superfluous to extol the virtues of humus as a soil amendment, yet this might prove interesting in its detail and perhaps instructive to some.

Its addition to all but humus soils improves the same in many ways.

Not only are the plant foods in humus easily made available for plant use, but it also renders those of the soil itself available; therefore, adequate addition of humus to soils already containing these is in a measure the equivalent of adding a complete fertilizer.

Soils rich in humus are warmer, other things being equal, than other soils, and this is an important fact to the fruit and vegetable grower since it advances maturity of the crops.

In the arid regions perhaps the greatest usefulness of humus is in increasing the power of the soil to hold water, which it does in a remarkable degree. For instance, while a sandy loam will normally retain 10 to 15 per cent of its weight of water and a clay 25 to 35 per cent, humus will retain 200 to 300 per cent of the same. Now, where water is rapidly removed by evaporation the value of this property is beyond dispute.

It increases capillary action by improving the structure of the soil, and hence, moisture efficiency, facilitating the movement of water and plant foods toward the feeding roots, replenishing these when removed by absorption in to the plant body.

In Southern California conditions the maintenance of adequate supplies of humus and humus forming materials in the soil is of the first importance as this increases the efficiency of all fertilizer materials and keeps the soil in the best condition for the operation of every agency favoring production.

A relatively large amount of organic matter is required to produce a given amount of humus; therefore as a matter of fact a given amount of humus represents a much larger amount of ordinary organic matter.

TO CONVENE AT RIVERSIDE

Among those who will take an active part in the Riverside conventions, the following list of interstate visitors is noted: C. L. Marlatt, chairman, federal horticultural board, Washington, D.C.; E. P. Meinecke, pathologist, forest service, United States department of agriculture, San Francisco; A. W. Morrill, state entomologist, Phoenix, Arizona; Charles A. Park, president, Oregon state board of horticulture, Salem; A. L. Strausz, state horticulturist, Missoula, Montana; W. T. Swingle, pathologist, United States department of agriculture; S. C. Mason, pathologist, United States department of agriculture; A. D. Shamel, United States department of agriculture, Citrus Experiment Station, Riverside; E. J. Taylor, director of extension, Tucson, Arizona; O. M. Morris, head of horticultural department, State College, Pullman, Washington; E. Cantu, governor, Lower California, Mexico; E. R. Bennett, field horticulturist, Boise, Idaho; R. A. Cooley, state entomologist, Bozeman, Montana; M. L. Dean, chief division of horticulture, Olympia, Washington; S. B. Doten, director, agricultural experiment station, Reno, Nevada; Geo. M. List, chief deputy state entomologist, Fort Collins, Colorado; Harold R. Hagan, state inspector, Utah state crop and pest commission, Salt Lake City; W. H. Lane, inspector of imported fruits and nursery stock, Vancouver, B. C.; W. W. Mackie, state leader, cereal smut eradication campaign, University of California, Berkeley; De Lore Nichols, county agricultural agent, Flagstaff, Arizona; M. B. McKay, department of botany and plant pathology, Oregon Agricultural College, Corvallis; W. W. Henderson, Utah crops and pests commission, Logan; E. E. Kaufman, field agent, bureau of crop estimates, United States department of agriculture, San Francisco; Samuel Fortier, chief of irrigation division, United States department of agriculture, Berkeley; Harris Weinstock, state market director, San Francisco.

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Gas

How is a gas bag made and what kind of gas is lighter than air? How long will a gas bag stay up in the air without refilling?—Subscriber, Phoenix.

Our gas bag editor is on a vacation so we are unable to give very definite answer on the subject of lighter than air machines. We may say in a word, however, that hydrogen is the lightest of all gases, having specific gravity compared with air of 0.0695. Common illuminating gas made from coal or from oil is much lighter than air and is often used in balloon work. Length of time a gas bag will stay up in the air depends upon the construction and the material used. This material is usually silk which is treated with rubber or some solution which makes it practically gas tight.

Soldier Settlement Plan

Where can I obtain information concerning land open for homesteading by discharged soldiers? Is the land of sufficient value to make it worth while for an able bodied young man, with sufficient capital to tide him over the first year, to take it up? What would be the probable cost?—Subscriber, Berkeley.

We doubt not the inquirer refers to Secretary Lane's soldier settlement plan regarding which it would be best to write to Secretary of the Interior, Washington, D. C. It is said there are already 35,000 applications and they are now coming in at the rate of 600 daily.

Indian Runner Duck Eggs

Is there any limit to the market for Indian Runner duck eggs or is there any market for them at all?—Subscriber, Porterville.

Considered by their weight, Indian Runner duck eggs should command a market price above hen eggs. They have a fine flavor and weigh much heavier but as a rule the retail trade discredits and sells them much lower. However, there are consumers who maintain that they are not as nicely flavored as the hen eggs and until this feeling is changed on the part of the consumer these eggs will be handicapped.

Aphis—Mildew

My rose bushes are covered with some green insects and the bushes are badly blighted. Could you give some information as to how to destroy these pests?—Subscriber, Reedley.

This is a case of plant lice or, more correctly, aphis which may be controlled by spraying with tobacco extract which may be purchased of any seed house with directions as to amount of water in a working mixture. Also kerosene emulsion or strong soap suds will destroy the pests. The "badly blighted" condition is probably due to mildew which is best controlled by scattering dry sulphur on the bush when the leaves are somewhat moist.

Whippets

A subscriber of the Cultivator is anxious to learn as to whether there are kennels in the state of California devoted to breeding of whippets.

Swelling on Turkey

One of my turkeys has a swelling larger than a turkey egg back of the hip. It has a scab on it—another turkey has a swelling as large as a walnut on its jaw. Can you tell me what these are and what to do for them?—Subscriber, San Dimas.

The swelling on the hip is probably due to a bruise or some other injury. You can tell by its looks whether it contains pus or not. If it does, it should be opened and washed out with witch-hazel or a bichloride solution (one table bichloride to one-half pint of water). Then paint around the incision, taking care not to touch the inside of the sore, with tincture of iodine. If the swelling does not contain pus painting with iodine twice a day will probably reduce it.

The swelling on the jaw may come from an injury and may be due to swellhead or roup. If there is pus, open, and wash the cavity with peroxide of hydrogen or spray twice a day with this solution: four tablespoons witch-hazel, three drops liquid carbolic acid, two tablespoons water. Instead of the liquid you might use campho-phenique antiseptic powder, which may be bought at any drug store, but it is more expensive. If there is no pus, but merely a swelling, in sympathy with roupy symptoms in the nostrils, you might try the potassium permanganate treatment, which has often been described in this column. Dissolve a few permanganate crystals in a lard pail of warmish water, and dip the head of the bird in it for a few seconds. This washes out the nasal passages, and often effects a cure. The solution should be prepared fresh each time it is used and used twice a day.—J. A. K.

Turks Overfed

Occasionally I have trouble with my turkeys. Their craws puff up and seem full of air. I first notice they do not eat and seem languid. Even the small turks, not over a month or so old, are sometimes afflicted, while the majority of the flock will be all right. They have range, skimmed milk—soured—but fresh each day, grain, etc. They usually die after three or four days.—Subscriber, Willows.

It is the old story of turkeys that have been overfed or wrongly fed for weeks or months, suddenly dropping off with blackhead, euphemistically called "liver trouble". It is the little turks from three to six weeks old that most frequently die in this way, but sometimes a turkey will be apparently healthy till it is five or six months old and then begin to show symptoms. As soon as a single turkey refuses to eat or ceases to act hungry, stop feeding anything but cottage cheese or sour milk and green feed either chopped or on range. There is nothing else to be done, for the sick ones are already past help, but a cutting down of the ration may save the rest. We shall never be able to raise our turkeys successfully till we learn how very little they must have from the beginning. Turkeys should not have hard grain till they are about three months old, but they may have rolled oats from about the end of the first month, possibly earlier. For poults that are on good range a diet of sour milk and cottage cheese exclusively, in addition to what they get on range is a safer ration than one containing grain.—J. A. K.

Shavings For Mulch

I have a city lot all set to fruit trees and other plants. The ground lacks humus and dries out very hard after it is watered. I am not financially able now to put on enough manure

to help it much. I have thought of putting a large quantity of planing mill shavings around each tree, extending out several feet. Then when I water them I could simply throw the hose down to the tree and let the water run slowly enough to soak in and not run outside of the shavings, and the shavings would prevent the ground from dying out with a hard crust. I can get the shavings without any expense. What do you think of the plan? Of course I understand there is practically no fertilizer value in the shavings; they are simply to keep the ground from drying out. Would they have any bad effect on the trees? I have heard that redwood shavings should not be used. If so, why not? How do they differ from pine?—Subscriber, Long Beach.

Shavings are excellent as mulch, if of the right kind, but as suggested they carry no fertility to the soil, at least not for years. In any case avoid redwood shavings because of the tannin they contain "poisoning" the soil. That is the case at least if they are put on fresh from the mill. Where they have been exposed to the sun and rain and air for months they sometimes lose their objectionable qualities and may be used. Pine, cedar and other shavings do not have this objectionable feature but if they are going to be worked into the soil care must be used not to apply too heavily or they will give a physical condition to the soil which induces it to dry out much more quickly than a mulch which more readily decays. In this case we would use lawn clippings, leaves, weeds, wild oats which may be mowed from adjoining lots, or any other vegetable matter which can be thrown into a heap, wet down and composted with small quantity of dirt so as to make a fine application for the garden or around plants.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Property Disposal

Husband and wife purchase property partly from earnings of wife prior to marriage and partly from joint earnings. The title stands in the name of both husband and wife. The wife dies leaving five children, the husband remarries and dies leaving no will. There is no property other than the above mentioned home, the title to which is in the same condition as above stated. What of the rights as to the succession to the property?—Subscriber, Watsonville.

The code provides that in case of a conveyance to a married woman and her husband, the presumption is that the married woman takes the part conveyed to her as tenant in common. If such was the case the first wife would have an undivided one-half interest in the whole of the property. Upon her death as she died prior to the husband, leaving five children, her one-half interest would be distributed: one-third to the estate of the husband and two-thirds to be divided equally into fifths among the five children. The estate of the husband would therefore have an undivided one-half interest plus an undivided one-sixth interest. Upon death of the husband, that estate being his separate property having been acquired prior to marriage with his second wife, would descend one-third of the one-half, plus one-sixth to the second wife and the two-thirds of the one-half plus one-sixth to be divided into fifths equally among the five children, assuming that there are no children by the second wife.

Homestead Title

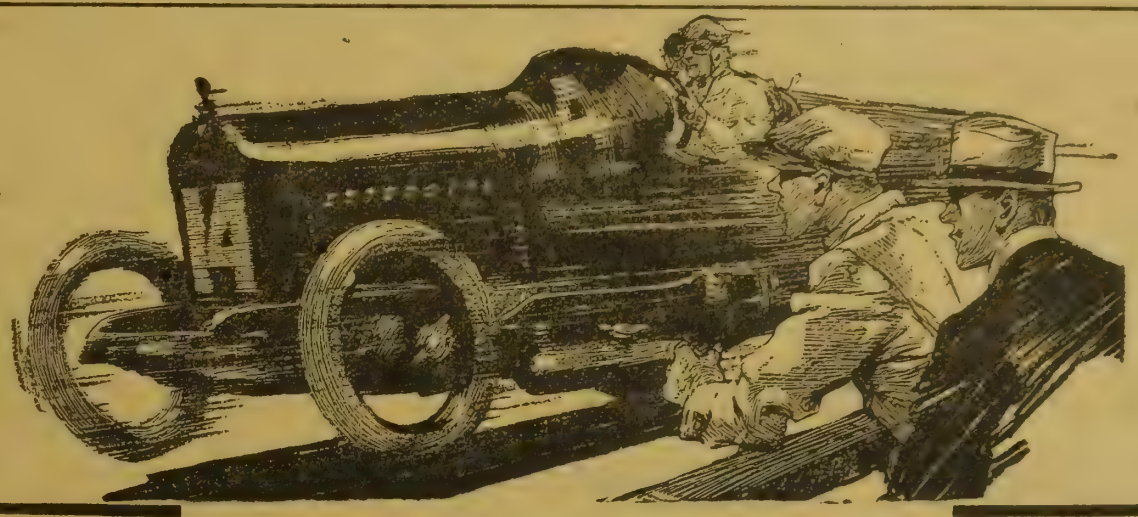
A homesteads 160 acres of land several years ago. A long time since he has given B to understand that he would leave it to B when he died. B takes care of A for a number of years, redeems his property from taxes and generaly looks after it. A executes a deed to B and also gives B his patent. A dies and B has his deed recorded. Six weeks later there is a deed recorded in the name of C to the same land. It is difficult to state the date of C's deed. Who was entitled to the land, B or C?—Subscriber, Oregon House.

B having first recorded his deed to the land, is legally entitled thereto. It is quite apparent that he is entitled not only by virtue of a deed of gift, but also by reason of a contract for services.

Cattle Trespassing

A number of us have taken up land in San Diego County, around which there is no fence. A non-resident cattleman runs his cows on our land. Can we collect for pasturage? Can we make him keep his cattle off our land? What course shall we pursue?—Subscriber, Verdugo.

As your land is unfenced, you apparently have only the right to take up the stray animals and impound them with the county pound keeper, filing and recording notice thereof, as several times heretofore outlined under the proceedings of the estray act.



First Mortgage

A sold property to B and permitted a first mortgage to be placed upon the land for $2500 for improvements which B was to place thereon. This mortgage was for three years. A took a trust deed for the purchase value of the land for six years. The title has changed hands twice. A portion of the land has been sold to C. The three years expired and A consented to an extension for three years of the mortgage. C now contends that A by this extension may forfeit his lien under the trust deed, and demands that A declared default for non-payment of first mortgage. Is it the fact that A forfeits any right by this extension of the first mortgage? What will happen if C starts proceedings? Can the loan company be compelled to pay off the first mortgage?—Subscriber, Lancaster.

Where a first mortgage grants to the mortgagor an extension of the time for payment on the mortgage but without any actual discharge of the mortgage or taking a new one and without any fraudulent intent as regards the second mortgage the latter cannot claim to be preferred to the first mortgage merely on the ground of such extension. Under this statement of the law it does not appear that A would in any wise forfeit his right, nor after he has made the extension could he compel the loan company to pay off their mortgage. It is difficult to see what proceedings C could start.

HOLSTEIN-FRIESIAN ANNUAL

The thirty-fourth annual of the Holstein-Friesian Association of America will be held in Philadelphia June 4 There will be election of officers, transaction of general business of the association, and voting upon various amendments to the by-laws. The secretary is F. L. Houghton, Brattleboro, Vermont.

Who Shall Find the Limit of Hudson Endurance?

We Have Tried By Most Gruelling Tests—
60,000 Hudson Owners Continue the Search

There must be some point at which a piece of machinery is taxed beyond its power of endurance.

But that point has not yet been found in the Hudson Super-Six.

Why We Tried the Speedway

It was in search of that point, rather than to demonstrate speed, that the Super-Six has won more records and made faster time under the gruelling strain of long sustained effort than any stock car ever built. Calling for superlative endurance under the stress and pressure of tremendous speed, by their very violence, these contests crowd scores of miles into one. They impose a strain that could be equalled under ordinary condition only by years of driving.

How Hudson Made Its Records

We decided to test Super-Six endurance on the speedway. We drove at highest possible speed for an hour—and beat the world's best time. We tried 100 miles without even approaching the limit. Then we tried 150 and 200 miles, setting new records. Next the Super-Six made 250 miles at the rate of 101 miles an hour. Such speed even for a single mile would send many stock cars to the junk pile. But at the finish the Super-Six has the same rhythmic pulsing purr as when it started.

The Final Test—60,000 Owners

Those records of endurance were shown by the same Super-Six motor that is in the cars of more than 60,000 Hudson owners. Theirs is the final test—the test of satisfactory service under all conditions; the test of contented ownership. Each one of those 60,000 knows he has a car that holds more worth-while records than any automobile ever built—and proves its right to them by its everyday service.

Hudson Makes Motor Mode

And in addition to these proofs of endurance Hudson makes a line of body types, the distinction and beauty of which is acknowledged by everyone. What greater evidence can there be of Hudson leadership? And need one ask for more assurance in deciding what car will best meet his requirements?

Hudson production has always been under the demand. This year shows a repetition of the shortage of former years. Even now immediate deliveries for the most part are out of the question. So to get a Hudson at all this year calls for early decision.

HUDSON SUPER SIX

Hudson Motor Car Company

Detroit, Michigan

Cooperation in Dairying

Point One — Everyone should eat more milk and butter, ice cream and cheese; city people especially, but they don't know it.

Point Two — The dairyman should advertise his product same as other producers advertise theirs.

Point Three — He will sell more and at better prices and will then have more money with which he will get better cows that will give more milk per cow, that will supply the increased demand caused by his advertising that will give him more money to get more cows and so on.

Point Four — For every advertisement for butter substitutes there ought to be one for milk or butter or ice cream or cheese.

Point Five — Not an advertisement for some one's Brand but a truth telling advertisement about the product itself.

Point Six — You say you are too busy to attend to it yourself; then combine with others in the same line and who are also too busy.

Point Seven — Subscribe a small sum of money, have someone on the job for you ALL THE TIME, telling the truth to the public, contradicting erroneous and false statements putting up YOUR side of the case and all under your own control.

Point Eight — The National Dairy Council and several State Dairy Councils are doing this.

Point Nine — California Dairy Council will be ready to do it too as soon as its membership and income are large enough.

Point Ten — Write NOW. Say you want to join and ask what YOU are expected to pay.

California Dairy Council

Lookingbill's Combination

PUBLIC AUCTION

DAIRY COWS, BEEF CATTLE, HOGS, HORSES, MULES, FARM MACHINERY, GRAIN AND REAL ESTATE AND LUMBER

Tuesday, May 27th, at 10 a.m., Sharp

At the Lookingbill Sale Yards, on Magnolia Avenue,

Riverside, Cal.

112 head of cattle. 50 head of CHOICE HOLSTEIN and JERSEY DAIRY COWS, EVERY ONE of which has been tubercular tested. This is an EXCELLENT bunch of cows, a number of which are 7- and 8-gallon cows. Some choice family cows. Good cows do not sell as high at RIVERSIDE as at other places—a mighty good place to buy. Six head of grade Angus heifers, with 8 little calves, 11 head of 2-year-old steers, 5 head of 2-year-old Holstein heifers, 30 head of yearlings, grade Angus, mostly steers, 6 little calves, 8 to 10 weeks old, 2 grade Angus bulls, 3 PURE BRED Holstein bulls, some pure Holstein cows and heifers being consigned.

41 head of HOGS, 1 pure bred Poland-China gilt, 3 grade Poland-China brood sows, 18 head of feeding hogs, 18 pigs, 10 weeks old, 1 Duroc boar, other hogs consigned, (possibly one car fat hogs).

There will be some good horses and mules consigned.

Ranch machinery, such as hay baler, wagons, harness, light wagon and tools.

200 bushels of good white Indian corn, in quantities to suit buyers.

REAL ESTATE AND LUMBER

Will offer the 1½ acres, with the privilege of 5 acres, where the sale yards are now located, at intersection of L. A. & S. L. R. R. with the P. E. R. R. at Magnolia Signal Station, all building materials that have been used in the construction of yards. Also OUR HOME, at 350 Jurupa Avenue.

TERMS: $100.00 and under, cash; sums over $100.00 one-third cash, one-third in three months, one-third in six months, on approved notes at 8 per cent. Two per cent discount for cash.

Good Free Lunch at Noon

The Need of a Live Stock Show at Los Angeles

By R. P. Royce

FOR a number of years the live stock interests of this state have been making strenuous efforts to establish one or more live stock shows aside from the state fair. Last year San Francisco and Los Angeles scheduled shows. The history of those shows is too recent to recount. Whether or not both cities will undertake to back a show this year is not, at this time, certain; but it is quite certain that San Francisco will have a show. Plans are being worked out now looking to the establishment of a permanent show for San Francisco. As yet nothing definite has been announced from Los Angeles. Whether or not Los Angeles' experience last year is too recent to forget remains to be seen. We hope that Los Angeles will decide to hold a show. As a matter of fact we feel quite certain that Los Angeles cannot afford to let the opportunity go by.

California is destined to be numbered among the leading live stock states of the union and this being true it is inevitable that live stock shows will come to occupy an important place among the established institutions of the state. Note that the word "institutions" is used. It is used advisedly, for a great live stock show is an institution.

The idea that such shows are run for the sole benefit of the exhibitors and that they simply serve to provide a meeting place where breeders can forgather, compete with each other and divide the premium money on the basis of the merit of their exhibits must be discarded. Likewise the view entertained by many business firms that a live stock show is a good thing for a city because it attracts a good crowd of buyers for the things that the city man has to offer must be discarded before a real show can be developed. Live stock shows serve a vastly different purpose and should be regarded as having an important function in the upbuilding of the resources of a community rather than being just an attraction to bring visitors to the city.

The prosperity of any community is directly dependent upon the prosperity of the tributary territory and such being the case it is quite obvious that any factor affecting the general prosperity of a section will in time reach the city. Therein lies the value of a properly located and managed show. Fairs and shows are of really great educational value. Go into any community where successful shows have been established for a period of years and inquire as to the value the community attaches to these annual exhibitions and it will be found that they are regarded as genuine assets.

The educational value of a show consists in the assembling of the highest type of the representative breeds, thus making it possible for the established breeder or the man about to enter the business to carefully study the merits of the various breeds, and at the same time to hold out an inspiration to all to produce a more efficient class of live stock.

The value of the improved breeds of live stock is generally recognized and there is slight need for an argument on their behalf, but the lamentable fact is that with the great majority of producers the propaganda must be carried to them and the show is the best medium for accomplishing this end.

California, as stated, has a great future as a live stock center. In this state, because of the superior natural conditions, it is admitted by all that the very highest type of live stock can be produced—and produced much cheaper than in any other state, but as a matter of fact California stands far down the list of the important stock producing states. The general average of our cattle and hogs, particularly, is such that it is cause for comment from Eastern men. Such a condition sould not be permitted to exist for the reason that the continuance of such a condition affects the prosperity of the entire state. Any factor that holds a possibility of improvement should be developed, and it is a proven fact that live stock shows and fairs are the most effective means of working such improvement.

Take the case of Oregon, for instance. For a number of years there has been a live stock show held at Portland, and today Oregon is counted as perhaps the leading live stock state of the West—this is certainly true so far as beef cattle are concerned, and the general average of Oregon stock is above that of California. We do not mean to convey the idea that Oregon has better individual herds than can be found here, but there are more of them. That the annual Portland show is given large credit for the improvement is evidenced by the fact that Oregon and Washington breeders and the business interests of Portland have raised a fund of $250,000 to provide a permanent home for the Portland show. Denver has had the same experience, likewise, Wichita, Tulsa, Fort Worth and Dallas—not to mention other cities, including Kansas City and Chicago, homes of the two greatest shows in America, and, in the case of Chicago, the greatest show of the world. There is not a city, now the home of a successful show that would consider abandoning these events. Furthermore the influence of these shows on the general average of live stock tributary to them is most marked. Consequently the producers in those sections are more prosperous than in sections with poorer quality of stock.

Geographically, California is so situated that one show, in addition to the splendid state fair, can not serve the entire state. There is a vast territory tributary to both San Francisco and Los Angeles that is essentially and distinctly the "property" of each city, therefore each city is a logical point for a show. Another point that is important is that a show at each city, one to follow the other closely, will help the other for the reason that exhibitors are attracted to a circuit and in the event that Los Angeles, San Francisco and Portland would arrange their shows so that one would follow the other it is certain that many of the best herds and flocks of the Middle West could be induced to come West.

Los Angeles is particularly fortunate in having an established fair plant to begin with. Exposition Park can, with moderate expense, be developed into a highly satisfactory home for a live stock show and with such a plant to start with a successful show can be conducted far cheaper than in other coast cities. If Portland can raise a quarter of a million dollars and San Francisco the necessary money, Los Angeles should experience little difficulty in financing a show.

The value such an exhibition would be to the territory tributary to Los Angeles can in no way be estimated. Almost immediately there would be developed a quickened interest among live stock producers, and with each succeeding year the influence of the show would be increasingly noticeable in the quality of the cattle, hogs and sheep reaching that market. Better stock insures a profit to the producer and if the producer is prosperous the community is prosperous.

If Los Angeles plans a fall show, definite action should be taken as early as possible in order that the exhibitors may order their operations accordingly. So far as the Cultivator has been able to learn there is a genuine sentiment among live stock interests for a permanent show at Los Angeles, and the majority of the breeders are anxiously awaiting an announcement that Los Angeles will stage a real show along with San Francisco and Portland.

HAD HIM THERE

"Deacon Simms 'low he doan' approve o' churches advertisin'," remarked Shinbone; "but when A ast him, in dat case, wuffo' he ring the church bell fo' service, he jes' had nuffin' to say."

Commercial Improvement of Dairy Herds

From Address by Dean H. E. Van Norman, University Farm, at Western Dairy Products Show.

AS I SEE IT the great problem is to make a cow owner aware of the fact that some or many of his cows are actually producing only 150 to 200 pounds of butterfat per cow per year, and that even at the present good prices of milk this amount hardly pays for the food eaten and the labor of caring for the cow; that, while this is true, the farmer might, by the use of the facilities within his reach, have cows that are producing from 250 to 300 pounds of butter fat a year and be getting $1.50 to $2.50 worth of milk for every dollar's worth of feed consumed.

The experience of most of us is that when a farmer is once actually convinced that a cow or several cows in his herd are kept at a loss and that other cows are making a good profit, he doesn't need to be told what to do with that unprofitable cow, and our problem is to convince him that there are these differences between his cows.

I can only urge that leaders use their ingenuity to bring this aspect of the problem before the attention of the farmer. One of the most effective means of doing this that I have seen is the work of the federal government representatives at the National Dairy Show, where with the cooperation of the show, a dozen cows with known records were exhibited, representing the three types; unproductive and yet of dairy conformation, highly productive and lacking in dairy conformation, and highly productive and having dairy conformation. The spectators were asked to look these over and pick out the highest producing four or five. Behind each cow on a double card so that the figures were not in plain sight was each cow's record. After the visitor had made his list, he was invited to separate the cards and see the record. This was usually very effective in arousing the genuine interest of the farmer who thought he could judge a cow by her appearance, as in selecting cows for this work attention was given to picking cows that were deceptive in appearance just for the purpose of teaching this lesson, as the greatest need in the commercial improvement is to jar the supreme faith that the average owner of unprofitable cows has in the correctness of his own judgment. Once we have done this, he is on the high road to improvement.

In the matter of the future of the dairy industry I have no fears, especially for that great rank and file of cow owners who are growing the bulk of their own feed and furnishing most of their own labor and who will keep good cows. There is an assurance of a steady market, and I believe personally at remunerative prices.

Half of the babies born in the United States would not live six months if it were not for the milk they get from the dairy cow—sometimes called "the foster mother of half the human race."

Scientific investigations show that all children should have milk, a quart a day at least, from the time they can walk till fully grown. Bow-legs in growing children are due to lack of milk, not to walking too young or too much, said the professor quoting eminent authorities.

Need we fear for the future of an industry so vital to human welfare as the dairy industry? Particularly with the public's growing appreciation of its importance. In an irrigated country where five to eight tons of alfalfa can be produced annually, the dairyman who feeds it to cows that produce 300 to 400 pounds of fat per year need not worry over the future. When war and reconstruction discouragements are driving out the unprofitable cow and the incompetent cow owner, there is a better chance than ever for the aggressive, resourceful dairyman who has good cows, a pure-bred bull of proven ancestry, and is growing most of his own feed and not wholly dependent on hired help and purchased feed.

With a world's shortage of butter and a great reduction in selling price, I anticipate an increase in demand that will maintain remunerative prices for the rank and file of successful cow owners and those dependent on her product for their business.

SECOND BERKSHIRE PROMOTION SALE

The second promotion sale backed by the Western Berkshire Congress was held at Dixon, May 17, and resulted in a general average of $43 on 30 head of boars and gilts. While the average indicates most conservative values a large number in the offering were young pigs.

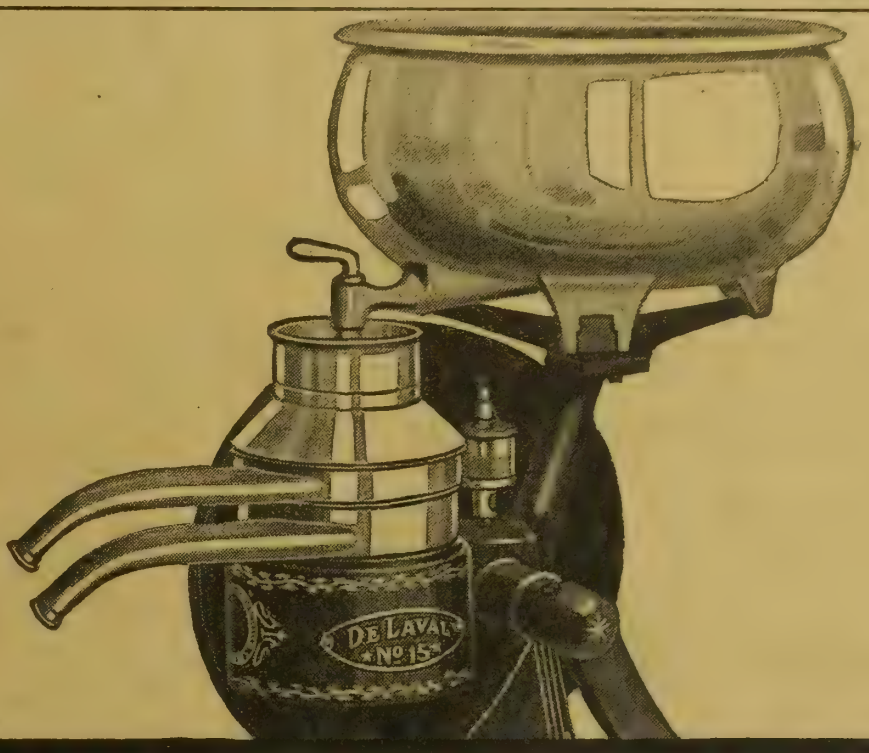
A number of exceptional bargains went through the ring. C. Harold Hopkins, manager of the Conoway Ranch, Woodland made a particularly good buy when he secured the April junior yearling boar, Winona Champion Rival, for $70. This boar, sired by Winona Champion 13th, and consigned by R. J. Merrill and Son, Morgan Hill, is one of the best boars sent through a public sale during the past year. Hopkins also secured five of the choice gilts.

The consignors to the sale were: R. C. Gruhlke, Dixon; J. Francis O'Connor, Santa Rosa; A. L. Stephenson, Los Molinos; A. B. Humphrey, Escalon; Geo. M. York, Modesto; E. H. Whiting, Ukiah; R. J. Merrill and Son, Morgan Hill; Sandercock Land Company, Sacramento; Geo. A. Murphy, Perkins; Geo. P. Upham, Martinez; Frank B. Anderson, Sacramento; Anchorage Farm, Orland.

The sale was managed by W. F. Sandercock and Frank B. Anderson. Col. Ord L. Leachman was the auctioneer.

The next sale will be held at Santa Rosa, June 7.

VERMONT IS STRICT



The commissioner of agriculture of Vermont is very rigid as to his rulings on importation of cattle into that state. All cattle imported into Vermont except for purposes of exhibition, public sale, pasturage or immediate slaughter shall be held in quarantine under the direction of the commissioner of agriculture for an official tuberculin test to be applied at the expense of the owner, not less than sixty days after arrival. Cattle admitted for public sale shall be subject to the above requirements if they are sold to remain in the state of Vermont.

This order shall not apply to cattle which have originated in federal or state officially accredited herds, and shall in no wise invalidate rules and regulations regarding imports already in effect.

A Salt River Valley, Arizona, farmer has suggested a plan for naming the roads of the country and numbering the farms in a manner similar to the system of numbering the houses and streets in the city. This plan has been approved by the Phoenix chamber of commerce and a committee appointed to put it into effect.

A big rodeo has started in Harqua Hala Mountains, Arizona, under the direction of Range Inspector A. C. DeWitt. This will cover the Agua Caliente country and work up along the Gila River into the White Tank Mountains of the Estrella Range. The county sheriff's force and the state live stock sanitary board will assist.

Arizona Field Agent L. M. Harrison of the United States bureau of crop estimates, states that the condition of this year's crop of wheat on April 1 was 97 per cent of normal.

The cream of cream separator prosperity goes to De Laval users

There was never greater need than right now for the best separator, skimming cleanest, having greatest capacity, turning easiest, requiring least care, and producing the most perfect product. In all these respects the De Laval has no equal. Take nothing for granted, simply let it be demonstrated to you. See the local De Laval agent or address the nearest general office.

DE LAVAL DAIRY SUPPLY COMPANY

EVERYTHING FOR THE DAIRY

61 BEALE STREET SAN FRANCISCO

Richly Bred Jerseys

at Public Auction

State Fair Grounds, Sacramento, Calif.

Tuesday, May 27, 1919

A complete dispersal, without reserve or limit, of the famous producing and show ring winning herd of registered Jerseys owned by Clifford F. Reid, Portland, Oregon.

50 Registered Jersey Cows, Heifers and Bulls 50

As President of the Northwestern Trust Company and other large commercial institutions Mr. Reid finds his time and energy too strongly drawn upon to permit the personal attention to which he believes his great Jersey herd to be entitled, hence his decision to sell.

The herd has been the feature of the show circuit wherever shown, and has to its credit production records up to world's records. There is only one cow over seven years of age in the herd and she produced a world's record daughter and is now only just past nine years old.

GOLDIE'S NEHALEM BEAUTY, the highest record Jersey cow ever sold at public auction, is of course conceded to be the star of the sale, and with her will be sold her dam, two sisters, one daughter, two sons, fourteen granddaughters, and six grandsons. Who will be the lucky owner of this great cow on the evening of May 27th?

EIGHTEEN COWS AND HEIFERS IN THIS SALE are bred to the two sons of Goldie's Nehalem Beauty, a wonderful opportunity for the buyer of high class foundation stock.

THE TWO SONS OF GOLDIE'S NEHALEM BEAUTY will make a fortune for their owners if given an opportunity in good herds. If they stay in California they will bear the distinction of being the two highest record Jersey bulls in service in the state.

There are fourteen beautiful young granddaughters of Goldie's Nehalem Beauty in the sale, good enough to go into any herd. Every breeder can own one of these with profit to himself, for granddaughters of world's record cows are not often offered for sale.

AND IF YOU WANT A REAL QUALITY YOUNG BULL just come to the sale and select one from among the six young grandsons of Goldie's Nehalem Beauty that will be offered.

REMEMBER—That this herd has long been under Federal supervision for health, and that not a single suspicious animal was found on the last Federal test.

SALE BEGINS PROMPTLY AT 10 A. M.

Live Stock in Imperial

By A. N. Nelson

DOWN in Imperial Valley, where superlatives never surprise, there is under way a live stock movement to Eastern markets which is declared the greatest of its kind in Pacific Coast traffic history.

During May and June, 1600 carloads of sheep and steers, valued at more than $3,500,000, will be shipped from this one producing district to Kansas City. Were the cars spotted on one track they would cover a distance of 12 miles, or a distance about equal to that between Los Angeles and Mt. Lowe. A census of the cars would show about 90,000 spring lambs, 60,000 ewes and wethers and 9000 prime steers. These are the number of animals which the Imperial Valley Cattlemen's Association and the Imperial Valley Sheep and Wool Growers' Association have assigned for immediate and early shipment to Kansas City.

The movement follows trial shipments to the Kansas City market covering a period of a year and a half, which have demonstrated, say the valley stockmen, that the Imperial, with its climatic advantages and green feed all year round, can ship its sheep and cattle a distance of over 2000 miles and successfully compete with the Middle West stockmen who can lay their stuff down in the big stock yards adjacent by short hauls.

The live stock industry of the valley, whose development was threatened a few years ago by great increases in cotton acreage, is now being widely extended. The valley with its 100,000 acres in alfalfa has always ranked as the first alfalfa county in the country but this year the acreage is greatly increased. According to the statistics of the county horticultural commissioner, alfalfa seed sufficient to plant 30,333 acres has been brought in to the valley since September. The estimates of cotton planting on the American side of the valley range from 30,000 to 40,000 acres, approximately half of last year's acreage.

During the last year when milkers were scarce, feed high and good prices prevailing for beef, many dairy cows of the genus "boarder" were sent to the block. The valley's butter production as elsewhere in the state, fell slightly, but the dairymen say the herds now are of a much higher standard. The demand for dairy cows in the valley is heavy and herds are being increased. The importance of the dairy industry in the valley is shown by a comparison of the valley's 1918 production of 5,154,808 pounds against the 358,478 of the other Southern California counties combined.

The newest development in live stock is the large number of ranchers who are turning to sheep husbandry. It is not altogether surprising in view of the figures which the sheepmen quote. One plan is to buy up on the outside flocks of ewes, bucked to lamb in November and December. The sheepmen ship them into the valley, run them on barley and alfalfa pasture and by April have a milk lamb weighing between 60 and 70 pounds which has been bringing prices around $15. The ewe, bought for $8.00 or $10, brings about $14 and a wool clip of eight pounds at 40 cents brings in $3.20 additional.

The Drovers Telegram, the Kansas City stock paper, the other day took notice of the valley, in an interview with a Calipatria grower, as follows:

"'A. D. Mackenzie of Calipatria, California, who sold a large string of clipped lambs at Kansas City this week, told of how these lambs are handled and what a great advantage the mild climate of the Imperial Valley is in this industry.

"'When a lone lamb, which will shear over four pounds of wool in December, weighs 82 pounds early in April and brings $12.70 a head, without having had a bit of grain, sheep husbandry is profitable,' Mr. MacKenzie said. 'That is just what our lambs did. These lambs are run on barley and alfalfa pasture. They grow fast and fatten at the same time and make choice mutton. Figuring the wool at 50 cents a pound these lambs bring close to $15 each at less than ten months old.'"

There are now 230,000 sheep in Imperial Valley, according to the estimate of I. T. Sparks, commercial agent for the railroad administration, the man who is directing the traffic end of the big movement, with its multitude of details. It is part of his job to keep contact with the live stock industry.

"Within a few years there will be 800,000 head of sheep in the valley" Sparks predicts. "That is based on the rate of growth of the last few years and the fact that big sheep operators from all over the West have been here to look over the country, of which they have been hearing so much. They are coming in because there is no winter feeding place like the valley in America."

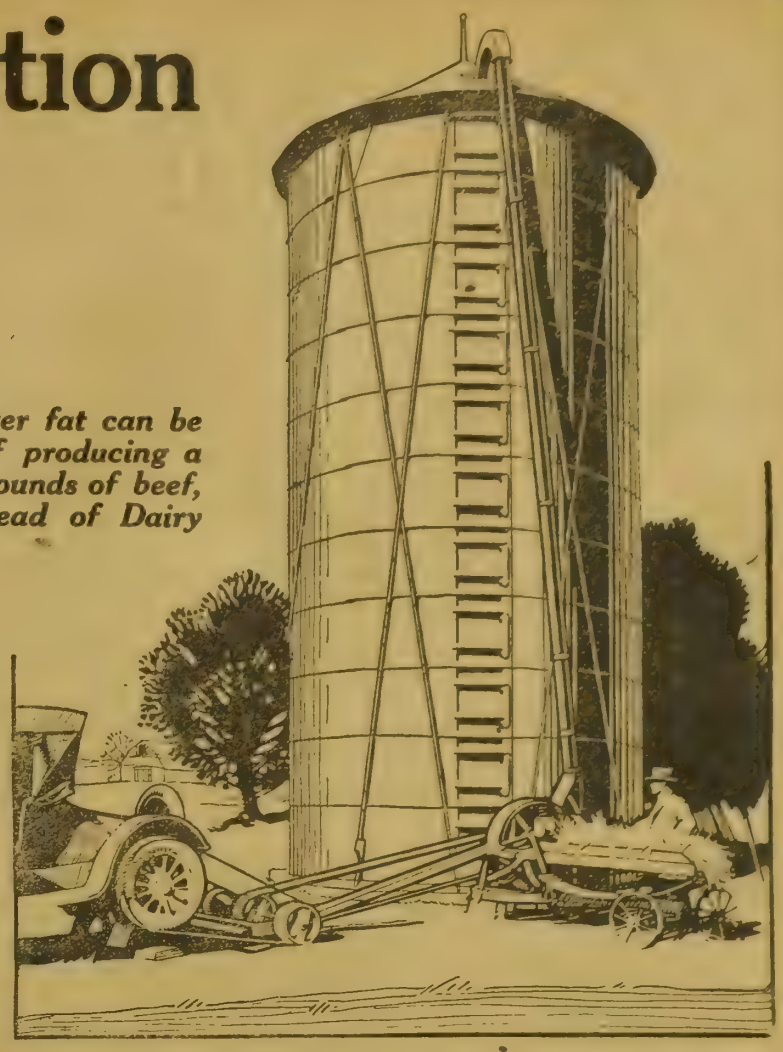
The beef cattle going to Kansas City are steers weighing around 1200 pounds. There are 44,000 head in the valley. At a recent meeting of the valley cattlemen's association were listed 9000 head as being ready to meet the demands of the Kansas City market and be shipped within the next six weeks. The local Coast markets are being supplied with grass fed cattle which are bringing from eight to ten cents while the Kansas City market, for such steers as the valley is sending, is running 15½ to 17 cents.

Starting a Dairy Herd with Calves

Young calves from good dairy cows are a satisfactory foundation for starting a dairy herd. Ordinarily the method advocated is to grade up common cows with a pure bred bull, requiring a number of years of patient selection and breeding, a period sometimes discouraging to energetic dairymen. Frequently this causes farmers, who want results too quickly, to change breeds.

It is expensive to buy mature dairy cows that are free from disease, that have good breeding and show desirable productive ability. Often, especially in new dairy sections, a farmer buys mature stock without being properly prepared to care for it, and many discouragements follow. To a great extent most of this difficulty can be avoided by buying good grade heifer calves from herds of well established milk production. In some dairy regions it is a common practice to sell the heifer calves for veal. These calves, while only grades, are usually from good producing ancestors and carry a productive ability much greater than common cows.

The buying of such calves to start dairy herds has been tried in several states with excellent results. Of course the cost of small calves is much less than mature animals, and the danger of disease is also greatly lessened. In general, shipping is simpler. Calves may be shipped by express at from two to four weeks of age, depending upon the distance, with good results if they are properly cared for upon arrival.



In buying it is important to deal only with dairymen. Do not buy from men who purchase calves at stock yards to ship back to the farmers, because it is not always possible to determine the breeding of the calves; and calves that are physically unfit may be shipped.

In some cases shipments are made c. o. d. which enables the buyer to see the calves before paying for them. A man who sells calves in this way makes a special effort to please his customers. It seems desirable, especially in sparsely settled sections, that more attention be given to perfecting a satisfactory system of distributing dairy calves to farmers.

Advantages in buying small calves as a foundation for a dairy herd are summarized as follows:

Small investment; better breeding; greater freedom from disease; in case of accident loss is smaller; raising calves stimulates interest and in consequence causes better care of live stock; a satisfactory herd can be established more rapidly than by grading up common cows.

Increase Production Reduce Costs With Silage

"It is safe to say that with silage, the cost of butter fat can be reduced six to twelve cents per pound and the cost of producing a hundred pounds of milk thirty to fifty cents, a hundred pounds of beef, a dollar to two dollars."—A. L. Haecker, formerly head of Dairy Dept., University of Nebraska.

Prof. Haecker further states:

"The silo should be considered a part of the necessary equipment for a dairy or stock farm, for it has to do with the success of the business.

"The largest item of expense in keeping a herd is the feed bill. Labor comes next but the feed bill is generally twice that of labor and the silo strikes directly at the overhead, making a big saving in the cost of feeding.

"It also produces better young stock and increases production.

Record Yield Due to Silage

"Practically all of the great milk and butter records of the country are held by cows that have been fed silage.

"Large, growthy, vigorous young stock are easily and cheaply obtained by the liberal use of silage.
"It is surprising to find on our best stock farms not one but five or six silos.

"It is difficult to determine accurately the saving made by the silo, when cost of ration is considered, for so many conditions enter in which make a variation in the result, but it is safe to assume that from ten to twenty-five dollars can be saved in the cost of feeding a cow one year by the use of silage.

One Man Feeds 40 Cows in 30 Minutes

"By properly arranging the silo and barn, it is possible for one man to feed forty cows in thirty minutes. The work can be done with ease and without the use of horse or wagon.

"The silo is the most economical equipment for storing forage. Eight times more feed can be kept in a silo than a haymow.

"There is less deterioration in holding over silage than in holding dry fodder.

"I have seen excellent silage that was six years old and this same silage was fed successfully to cattle, who seemed to relish it more than new silage.

Silo Insures Your Feed Crop

"The silo stands ever as insurance against forage failures, especially damage by frost or drought.

"Any kind of feed that can be grown can be saved in the silo though it might not mature a grain crop.
"It makes farming more secure and warrants a cheap and excellent forage for all kinds of stock in both winter and summer.

"Six times more feed can be furnished on pasture ground, if it is put in the form of corn and siloed.
"It is not uncommon to see corn fodder produce as many as twenty tons of silage per acre.

"The pasturage of land worth a hundred dollars and up per acre is questionable, especially in sections where summer droughts are frequent.
"The summer silo in many sections is needed more than the winter silo.

"The silo will lower the cost of digestible carbohydrates, it will make your acres earn more, your work easier, your storage greater, the production of your cows higher, your farm richer."

Live Stock News Notes

Holstein Records at Tulare

At the Sturgeon stock ranch at Tulare last week some interesting official records were made by Holstein-Friesians under the inspection of experts from the state university, the results showing in the character of dairy stock which is being bred to a great extent in the Tulare section.

Clothilde Beauty Pontiac Veeman, a granddaughter of the great sire Sir Veeman Hengerveld, freshened on her third birthday and was put on test, making 20.83 pounds of butter from 492.7 pounds of milk, her 30 day record showing being 83.33 pounds of butter from 2251.9 pounds of milk. A bright future is predicted for the heifer.

Princess Hengerveld Arizaba, freshening at six years, made 23.66 pounds of butter from 605.3 pounds of milk, giving as high as 90 pounds of milk in one day. The cow was in poor flesh for the test and is expected to greatly exceed her record by next year.

Lady Legathend, a three year old, made 18.78 pounds of butter from 513.6 pounds of milk. The Sturgeon ranch has received the first of the calves from their new herd sire Segis Pontiac Abbekerk, bought at Sacramento last June for $3200, and they are a uniform and well marked bunch. Six of the first seven were heifers and it is remarkable that three of the cows brought heifer calves last year.

Lookingbill's Combination

Col. W. C. Lookingbill is offering at public auction at his sales yards in Riverside, May 27, 112 head of dairy and beef cattle, also hogs, horses, mules, farm machinery, etc. He will offer 50 choice Holstein and Jersey cows, every one tuberculin tested. He also has a fine bunch of feeder and pure bred hogs.

Rough's Pure Breds

Mr. Rough, owner of Rough's Pure Bred Stock Farm, Arlington, states that he is now placing on test a number of his Jerseys, 32 of which are now in milk. At the head of his herd is Merry Maiden's Conquest, son of Merry Maiden, the grand champion cow at the St. Louis World's Fair, and grand son of Financial King, the $50,000 bull in the Van Pelt herd.

Fine Hampshires

Hampshire swine are being developed on Fairbanks Ranch, Redlands, and A. E. Harvey, manager, states that in developing this herd he is paying particular attention to size and bone. The herd now consists of 15 sows and about 25 young gilts, headed by the boar, Harvey's Choice, out of the grand champion sow at the Panama Pacific Exposition. The show herd this year will be made up of young animals unless some mature stock is added to the herd a little later.

Some Jersey

J. E. Wherrell, breeder of Jerseys, Riverside, announces the finishing of test of Verde of Willowood, making 591 pounds fat as junior three year old, which, he states, is the record for the state. Recent sales were two heifers for shipment to Hawaiian Islands.

Gatton Gone East

Walter R. Gatton, manager of the swine department at Diamond Bar Ranch, is in the East purchasing several cars of Duroc-Jerseys. It is Mr. Gatton's intention to select several boars and sows of show caliber as additions to the present show herd now being fitted on the ranch.

Buying Guernseys

Alex Bengestorb, manager Hollow Hill Farm, breeders of Guernseys, is in the East selecting a number of Guernseys to add to the 94 now on the farm. Eight cows are now on official test with others to follow soon.

Home Again

B. H. Wilkinson, manager swine department of Falfadale Farm, has returned from the army and is again in active charge of the Duroc-Jerseys. Owing to his absence the litters are coming late so he will have no young animals for the shows this year but states he will probably make a few shows with his aged herd.

Offers Special Prizes at County Fairs

In addition to the generous support given the state fair and the larger live stock shows of the state, the American Shorthorn Breeders' Association, will offer a special prize for the champion Shorthorn bull shown at the Riverside, Kings and Butte Counties' fairs.

Governor Signs Pure Feed Bill

The live stock owners of the state will be glad to know that the pure feed bill passed by both branches of the legislature has been signed by Governor Stephens and therefore becomes a law.

For the first time buyers of mixed feeds will have a method of knowing just what they are paying for and will no longer be at the mercy of unscrupulous feed dealers.

The passage of this law marks a big gain for the live stock industry and is a concrete example of what can be accomplished through organized effort. Properly organized, the live stock interests can secure much needed legislation.

Will Buy Eastern Durocs

Bert Manly, who has been associated with the Conjeo Ranch, Newbury Park, for a number of years, has been visiting the Duroc breeders of the Sacramento Valley. Manly recently brought out a large shipment of Durocs and Hampshires and expects to make another trip through the Middle West in June for the purpose of buying more Durocs.

Blackhawk Ranch Establishing Shorthorn Herd

Easton and Ward, owners of the Blackhawk Ranch, Diablo, are laying the foundation for a high class herd of Shorthorns. Manager E. Lovell who is now in the East making selections from some of the top herds, has purchased 35 choice cows and expects to buy at least 12 more heifers before he returns.

The Blackhawk Shires have been attractions at Western shows for a number of years and it is expected that the Blackhawk Shorthorns will become equally famous.

Average Sale Prices for Guernseys

The American Guernsey Cattle Club has issued a report covering 32 public sales held in 1918. The report shows that 1318 Guernseys sold for $444,940, an average of $330 per head.

Poland-China Futurity Nominations

The following Poland-China breeders have made nominations for the futurity classes to be shown at the 1919 California state fair:

W. A. Young, Lodi; A. L. Bassett, Hanford; M. Bassett, Hanford; Geo. V. Beckman & Sons, Lodi; John M. Bernstein, Hanford; W. Bernstein, Hanford; A. Buckland & Son, Fresno; J. H. Cook, Paradise; J. A. Crawshaw, Hanford; W. T Dice, Hanford; Chas. Gatewood, Fresno; Fred Gatewood, Fresno; W. L. Haag & Son, Hanford; N. Hauck, Alton; N. K. Horan, Lockeford; J. F. Lehman, Lodi; McCarty & Starkweather, Modesto; Les McCracken, Ripon; H. I. Marsh, Modesto; Eugene Miner, Lodi; Fred D. Ross, Hanford; Hugh C. Shinn, Tulare; C. A. Vaughn, Hanford; J. W. Wakefield, Acampo; R. J. Yates, Orland.

New Ayrshire Herds in El Dorado County

E. B. McFarland, San Mateo, owner of the Steybrae herd of Ayrshires, writes that he will go to Canada in June for the purpose of selecting a shipment of cattle. Included in the lot will be a carload for the newly established Ayrshire breeding plant, Penobscot Farm, Cool, El Dorado County.

McFarland states that there is much interest in Ayrshires in El Dorado County and that he has recently sold

SANTA ANITA RANCHO

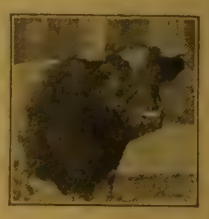
Anoakia Breeding Farm

Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion and Don Castano, five gaited saddle stallion, winner in many prominent shows.

Mammoth Jacks

We have for sale a number of two and three year old jacks, big, growthy fellows of exceptional breeding and quality.



Poland China and Berkshire Boars

Sired by the World's Fair winners, BANKER'S BOY and KINTYRE LAIRD, and by others of our herd boars of equal breeding.

What is a Shorthorn Bull Worth?

If a registered Shorthorn bull during his life sires 100 calves worth $50 more per head than calves from the same dams by a scrub bull he is worth $500. If they sell for $10 more he is worth $1,000. If $20 more, he is worth $2,000.

But suppose they sell for $50 more—what is he worth? He is actually worth $5,000 in gold.

It will pay you to use a high class Shorthorn bull. He will cost much less than his value.

You get paid for quality and pounds both at the beef markets. Many a 1,600 pound Shorthorn cow yields from 7,000 to 10,000 pounds of milk per year.

Hollow-Hill Farm
Colton, Cal.
Only Bull Calves For Sale

two cows, Ravendale Rebecca and May Manning of Rockbridge Farm, to The Hill Farm. The Penobscot Farm has purchased a young bull, by Willowmoor Robinhood 32d, from McFarland.

To Develop Pure Bred Live Stock

The Board of Trade of Yolo County recently called a meeting of the leading live stock men of the county for the purpose of working out a plan to make Yolo one of the leading live stock counties of the West. Some of the oldest and most widely known herds and flocks are located in that county and it is hoped that through organization and cooperation the number will be greatly increased. A committee consisting of Frank Morris, Henry Eakle, W. J. Bemmerly, Edward Bullard and C. H. Hopkins, was appointed to work out a plan of action.

Choice Durocs

H. P. Slocum & Son, Willows, have recently sold five choice Duroc gilts and a boar to the Elliott-Brant Rancho, Los Angeles. It will be recalled that last fall the Elliott-Brant Rancho purchased a boar from the same firm, and afterwards sold him to an Eastern buyer for $1000.

Will Sell Shorthorns October 16

Dr. H. M. Elberg has claimed October 16, as the date on which he will hold a public sale of Shorthorns from the Roselawn herd. The forthcoming sale will be made in order to close up a partnership arrangement existing between Dr. Elberg and the Gibson estate.

A feature of the sale will be the offering of the splendid bull Crescent Dale. This bull is one of the top bulls of the West. He is not only an excellent individual, combining unusual thickness and mellowness of flesh with rare smoothness and quality, but he has demonstrated his ability as a sire.

All the females to sell will be bred to him or to the younger bull, Roselawn Champion, junior champion at the 1918 state fair. The sale will be held at Roselawn Farm, adjoining Woodland.

More Good Herefords

The Conejo Ranch, Newbury Park, recently purchased 16 choice Anxiety-bred heifers from J. H. Tschudy of Kansas City. Bert Manley selected the cattle.

Cebrian Shorthorns to Sacramento

Edward Cebrian of San Francisco who purchased the entire herd of Shorthorns formerly maintained by J. K. Macomber at his Paicines Ranch now has them installed at his ranch just west of Sacramento. The herd consists of 450 head of all ages and included in the lot are many of the choicest bred females owned in the West. The herd as it stands at present represents three famous herds, namely, the Howard, Macomber and Elmdorf collections, and constitutes a highly valuable foundation from which to produce breeding stock that exert large influence on the cattle of the state.

$332,100 for 173 Herefords

Eastern advices state that on May 6 and 7 O. Harris and Sons of Harris, Missouri, sold 173 head of Hereford bulls and females at public auction for a total of $332,100, an average of $1919 per head. Twenty bulls brought $129,100, an average of $6455, and 123 females sold for $203,000, an average of $1601.

Among the chief sensations of the sale was the selling of the four-year-old bull, Repeater's Model, to J. R. Smith of Fayetteville, Tennessee, for $35,000. This bull, counted by many to be the greatest bull the Harris' ever offered, was sired by Repeater and out of a Disturber dam. Repeater 191st, the undefeated senior calf of last year, sired by Repeater and out of a Beau Donald 5th. dam, was sold to Jos. J. Rezac and Sons, Tabor, South Dakota, for $26,000. Repeater 134th, a two-year-old son of Repeater, sold to O. G. Lee of Kansas City for $20,000, and the senior yearling, Repeater 194th, was taken by William Galloway of Waterloo, Iowa, and Dr. Wilbert Shellinberger of Chicago for $19,000. Two two-year-old heifers sold for $5,700 each.

Shorthorns to South America

The American Shorthorns Breeders' Association has assembled a collection of Shorthorns for shipment to South America. The cattle were secured from Illinois, Wisconsin and Minnesota breeders and cost from $1500 to $6500 per head.

VALUES IN THE HORSE

An Ohio farmer who is very enthusiastic over good and dependable draft horses, especially Percherons, gives the following information regarding six big mares with which he started some year ago.

The fact that the horse must be a part of every farmstead is undisputed, and now that we have been shown how we can economically utilize this power to do all our work, heavy or light, without additional expenditure, we are indeed in a fortunate position. The flexibility of the multiple hitch to suit any size field or any size farm is a great item.

When the idea was first broached to me, I was as skeptical as any doubter, but after seeing just what this hitch will do and using it as I have done on my own farm, I am thoroughly convinced as to its practicability, flexibility and economical usage in our everyday farming by everyday farmers.

The other day I stood watching one of my teams in the field, and when I noted the ease with which those six big Percheron mares pulled that two bottom "14" gang plow, breaking a heavy clover sod, the thought came to my mind as to just what those six mares meant to me in a financial way, to say nothing of the pleasure of seeing and owning those good old brood mares, so I took out my pencil and jotted down a few figures that I can vouch for as being accurate.

The six mares that happened to be hooked that day had an average age of 11½ years, had been owned by me an average of 6 years, and their initial cost to me represented the sum of $3,317.50, or an average of $570 each. During my ownership of them they have produced offspring that have sold either for cash, or I have been offered cash for same, and have retained them for my stud, to the amount of $8,685.00, or an average sale of produce of $1,470.83 per mare. I know that if I offered the six for sale tomorrow morning for $3,000 I would not have one left by nightfall, and I know that these faithful workers have more than earned their keep by their daily toil in the fields, to say nothing of the tons of manure they have produced to fertilize the soil of my farm.

The interest on my investment of $3,317.50 for these six matrons, at six per cent for six years amounts to $1,196.30. Deducting this from the $8,685.00 realized from the sale of their offspring, still shows a net profit of $7,489.70 or over $850 more than double the original cost of the mares. This does not take into account the show yard winnings of these mares or their produce, which amounts to several hundred dollars.

GRANGE ON COMING LEGISLATION

Commenting upon any action which congress may take in the special session just called, the national headquarters of the Grange at Washington writes:

It is a foregone conclusion that the work of the special session will be a queer jumble of the things which must be done to continue the functioning of government and the things which can not be avoided to meet the demands of business. Agricultural interests must enter into the hurly-burly of such a contest as this all implies; what it means as to success and the means of achieving success is only too plain.

The great interest of the general public in the farmer is everywhere evident, but it is equally evident that for the most part this interest centers in what and how much the farmer may be induced to produce, not in how well the farmer may be recompensed for his labor. The wave of farmer organization sweeping over the country is also noted in every quarter. A principle based on history and human nature has been set down in these words: "No reform has ever gone far or accomplished permanent results unless it has developed its leaders from the ranks of those most affected. There is an inherent danger in the progress of any reform movement unless it is directed by those who know of their own knowledge every feature and every turn of the currents of life and thought and occupation of the class most affected by the change and which is the party of the first interest."

The Grange fully appreciates the depleted larder of the world and urges its members to produce as largely as possible of the needed foods and textiles; but the Grange stands also on this principle:

"A prosperous and progressive agriculture, with an independent, self-respecting citizenship in the open country is the surest guarantee of an enduring national life. Farming must be made as profitable as any other occupation involving the same amount of investment, business ability and hard work, or our democracy must fail and our people go hungry."

Garden Pests

By E. Ralph de Ong

IT is so common to give in millions or other inconceivable figures the number of dollars of loss which comes from various pests that it has become trite and perhaps of little force, but the gardener who finds his crop withering and dying because of the exasperating pests has a much better opportunity to "visualize" the real loss which they occasion. Likewise, when he pays good "long green" for appliances and chemicals for controlling the pest he has other proof of the cost of these pests. But the wisdom of this expenditure to save a greater loss is not contested. We are glad to give here a few hints by Mr. de Ong:

Aphids or Plant Lice

Spray the plants at the first sign of infestation with the following preparation:

	Large amount	Small amount
Nicotine sulphate (40 per cent)	6 oz.	2 teaspoons
Fish oil soap or laundry soap (dissolved)	2 lbs.	1 inch cube
Water	50 gals.	1 gal.

The amount of soap varies with the hardness of the water. Use sufficient, however, to make the water sudsy. Apply the spray with an angle nozzle so that both sides of the leaves will be wet, care being taken to cover every insect as only those hit by the liquid will be killed. This spray requires several hours to reach its full effectiveness.

Strong soap solutions, one pound to six or eight gallons of water are also effective, but are more dangerous to the plant.

Thrips

These insects feed similarly to the aphids, but are more inclined to cause the leaves to turn pale and dry up. Keep the plants in a thrifty condition and if necessary spray with the same formula as for aphids. The illustration shows a typical case of bean thrips injury to foliage, the black excrement on the upper leaf being typical of the work of the nymphs. The dark spots on the lower leaves are the adults shown in natural size.

Squash Bug

A mid-summer pest of pumpkin, squash and to a less degree, of melons. No spray will kill the insect which will not also injure the host plant hence trap cropping and hand picking must be resorted to. Melons may be protected to a certain extent by interplanting with squash as a trap crop and when the latter is attacked spray it with pure kerosene; this application of course will injure the squash. Hand picking of the adults, nymphs and eggs when first found in the garden will hold them in check. The bugs usually gather in sheltered places in trash or under boards lying on the ground where they may be taken quite easily.

Diabrotica

A green beetle with black spots.

Looks Bad, Smells Bad, Is Bad

A serious pest wherever cucumbers and other garden truck crops are grown. An enlarged view of a squash bug. Also note at left eggs showing same enlargement.

Not Large Enough to See but Effects are Visible

The bean thrips which cause the ruin of these leaves are not very plainly seen in the engraving but the destructive nature of the pest's work is plainly shown. The technical name of the beast is Heliothrips fasciatus.

Top Dress with Nitrate

Plenty of Nitrate in Chile

The total amount of Nitrate of Soda in the vast Chilean Deposits is

720,000,000 Tons

At the present rate of the world's consumption, these deposits will supply Nitrate for

300 Years

Shipping conditions are rapidly improving. American farmers should learn the FACTS about the Nitrate Supply. Write for information.

Uncle Sam's Fighting Boys Wear IRONCLAD KHAKI

Twill Cloth

You men and women of his "home guard" should wear this patriotic economy cloth, too. It's fast color and wears like leather.

Overalls, Coveralls, Shirts and Pants

made of the genuine Ironclad Khaki (the kind Uncle Sam uses) carry the yellow "army" label, like the above. Look for it and Guaranteed Bond in the garment before you buy.

Write today for free samples of Ironclad Khaki Cloth, and Miss Ironclad Khaki, the kid glove finish ladies' overall cloth.

Garments on sale by dealers—everywhere

FRANKLIN MANUFACTURING CO.
Manufacturers of Cloth Only
113 Market Place - Baltimore, Md.

Mr. Farmer

If you grow Raisins, Prunes, Peaches, Pears, Apples, Apricots, Grapes, you need a

Sahara Drier

Every year your losses run into thousands of dollars because of adverse weather conditions — overripe fruits, etc. The Sahara Drier guarantees you against such losses. It is the cheapest and best possible insurance for your crops. You cannot afford to take a chance on early rains such as came last Fall.

WINE GRAPES — Many of the California growers are making ready to dry their 1919 crop. We guarantee our machine to do satisfactory work. Our patented process makes this possible. Prices are $650 and $850 for our one-ton-per-day Drier. See our representatives for particulars:

Home Office 149 California St., San Francisco California.

The cucumber beetle is similar to this insect but is slightly smaller and with three black stripes on the back. They feed on the principal garden crops, alfalfa and many decorative plants. For the latter hand picking is the chief dependence. Vegetables may be sprayed with arsenate of lead (the neutral or basic type being the safer), four pounds to 50 gallons of water. Apply carefully on both upper and under sides of leaves. The long, slender antenna distinguishes this insect from the beneficial coccinellids, or ladybirds, the latter having a very short, knobbed antenna often concealed beneath the head.

Cabbage Worm

This insect attacks cabbage, cauliflower, brussels sprouts, nasturiums and other plants. Spray the plants up to the time they are half grown with arsenate of lead, three pounds per 50 gallons of water, combined with two pounds of dissolved fish oil soap or resin soap to cause the liquid to spread over the leaves. Hand picking may be resorted to in small gardens.

Cut Worms

Fat, greasy, naked caterpillars which feed on the stalks of young tender plants. These worms work at night and through the day are found buried an inch or two in the ground just at the base of the last plant fed upon. By scraping away the soil the worm can usually be found and killed. Poisoned bran bait is most effective when they are abundant. For small areas mix four pounds of wheat bran, three ounces of white arsenic, one pint of strong molasses and about three quarts of water or enough to form a crumbly mass. This bait may be scattered around the plants where the cut worms have been feeding, or better still, broadcasted over the plot before planting. Dried lumps of the bait should be gathered and destroyed as this is dangerous to poultry and other animals. Fresh, green alfalfa dipped in a solution of arsenic, one ounce to five gallons of water, has given good results when scatterel about the garden after night. Finely sliced raw potato dipped in the powdered arsenic is also of value.

Tuber Moth

The larva of the moth burrows in potatoes, and also feeds on the leaves and stems of the potato plant. Use clean seed, plant deep and hill up well. Keep wilting tops away from the tubers when the latter are being dug. Do not leave the potatoes exposed at harvest time, especially during the afternoon and night, where the moths will have access to them. Clean up all the small and broken potatoes left in the field and use them for stock feed. Infested marketable stock should be fumigated before being stored for the moth breeds freely in the storage room.

Slugs and Snails

Scatter hydrated or air slaked lime freely over the ground about an hour after dark. These animals are feeding at this time and thus a better opportunity is given of covering their bodies with the lime. Choice plants may be protected by a border of lime, three or four inches wide, spread entirely around the plot.

Gophers

The cheapest method of control is by poisoning, which should be supplemented by trapping, flooding and fumigating with carbon disulphide.

Poisoning. The following formula has proved the most successful:

Sweet potatoes, parsnips or carrots	8 quarts
Strychnine alkaloid, powd.	¼ ounce
Flour paste	½ pint
Saccharine	1-16 ounce

Chop the vegetables, or cut them with a knife, into one-half inch cubes. Make a thin paste of flour and water and boil for a few minutes. Stir the strychnine and saccharine into one-half pint of the cooked paste and pour it over the chopped vegetables, stirring until each piece is coated. Two or three of these cubes are to be dropped into each runway. Locate the main runs by means of a steel prod, drop in the poisoned bait and close the opening. Poisoning is most successful in the late fall, before green feed starts and after the first heavy rains.

Carbor disulphide may be applied by means of a ball of waste saturated in the liquid and dropped into the run, or the gas may be pumped into the burrow with any of the special machines which are on the market for this purpose. In either case the opening into the run should be closed immediately after charging. Carbon disulphide is an explosive material and should be kept away from fire.

GRAIN ELEVATOR IN ALAMEDA COUNTY

H. T. MOHR, who is a progressive farmer in the Amador Valley with a thousand acre ranch near Pleasanton in Alameda County is one of the first California wheat growers in the central part of the state who has grown thoroughly tired of throwing away thousands of dollars annually for wheat sacks and unnecessary labor in handling them and recently completed a 40,000 bushel storage and shipping elevator to handle his crop in bulk in time for the next season.

This Amador Valley farmer is a native son born in Alameda County 61 years ago. He has studied farming from all its angles and is analyzing his job from the point of view of getting the greatest degree of efficiency in every phase of his business. "Progressive" spelled in capital letters is the adjective describing Mr. Mohr.

There are 14 storage bins in the Amador Valley Farmer Elevator as it is called, four of these bins are 10 x 10, four are 5 x 10, and there are six overhead bins in addition. The capacities of the overhead bins range from six to eight hundred bushels, and from 2100 to 4200 bushels for those on the lower level. The eight larger bins are all hoppered, and with the overhead bins all feed by gravity into the elevator boot, permitting the handling of the stored grain in the most economical method possible.

A Farmer's Elevator

Elevator built by Mr. Mohr of Amador Valley. A familiar sight in the East but one of the first in California. Bulk storage of grain is growing.

This elevator cost $15,000 and is built of wood in the typical style of grain elevators in the Pacific Northwest, and Eastern and Middle Western states. It is equipped with the latest type of elevator, automatic scales, automatic dumping machinery and motive power. Its foundation is a concrete slab 18 inches thick. The building is 33 x 30 feet and 52 feet high. The elevator and the automatic scales handle 1500 bushels of wheat per hour, and Mr. Mohr has several grain tight wagons with end gates that may be removed to control the delivery of wheat into the receiving pit under the floor of the structure.

While the builder is well satisfied with the bulk handling equipment he is frank to say that had he known about the designs prepared for several cooperative farm organizations for grain elevators and loading stations in which the fireproof, metal grain storage bins are incorporated, he would have installed such a structure instead of the wooden elevator he now has because of the reduction in the fire risk, the absolute protection against rats, mice, and other vermin, and the increased storage capacity obtainable for the same investment of time and money.

A good Road prolongs the life of everything that passes over it. It brings the farm and the market closer together—reducing costs to both producer and consumer. ARE YOU DOING ALL YOU CAN TO BOOST GOOD ROADS?

Mohawk Material Makes Mohawk Mileage

Mohawk tires actually represent more value in materials than any other tire you can buy.

We realize that's a broad statement. But we go on record with it—for the simple reason that we know it's true.

Here's the proof. Mohawk tires contain

No Reclaimed, Shoddy Rubber
No "Fillers"

Only the very purest rubber on the market—the very highest grade produced, is used in Mohawks. And another point—many supposedly good tires today contain in their treads "numerous fillers" that cheapen quality, barytes, clay, glue, whiting, lead, rosin.

You won't find a single one of these "fillers" in Mohawk tires, for the reason that if we used them we would cut down the expense of and increase the profits from the Mohawk tires, but at the same time, we would cut down the mileage yield that Mohawk tire gives. That we will not do—for we believe you prefer to buy your tires on their mileage ability rather than on price.

Add to pure material an extra ply of standard weight fabric—the fact that Mohawks are hand made by the highest paid tire builders in the industry—and you will understand why once an automobile owner buys a Mohawk he will have no other make.

Either cord or fabric tires—in ribbed and non-skid treads. Hand made, extra ply, Ford size tires, also.

HOGS

NICK GENTRY
Dean of the Berkshire Breeders, breeder of Baron Duke 201st, Grand National Champion, says: "I never saw a better width of loin than he has. If more breeders would produce the type of Baron Duke 201st there would be many more Berkshires raised and sold. Every animal on both sides in pedigree of Baron Duke 201st for many generations back were good ones; every one of them. His great size, good heart girth, very smooth shoulder, back and loin, legs and feet are hard to equal in one animal. If he is not a good one and a well bred one there is no other. I am glad to give you my opinion of Baron Duke 201st." N. H. GENTRY.
You can buy his three months' old weanling pigs from 650-pound prolific sows for $35.00. They are going fast. Order now.
SANDERCOCK LAND CO.
In charge of Natomas Land Sales..
23 Montgomery Street,
San Francisco, California.

CASTLEVIEW

Giant Type Berkshires.

We are booking orders for spring pigs from Grand Champion sows and sired by Mayfield Rockwood, sire of Champion barrow at 1919 Western Berkshire Congress.

Castleview Ranch, Santa Rosa, Calif.

BERKSHIRES. BERKSHIRES

For Sale:—Milch Goats. R. S. Payne, 229 North Los Angeles Street, Los Angeles. Telephone Main 7533; Home 13651.

DUCKS

Mammoth Pekin Duck Eggs for hatching $1.00 per dozen, $7.00 per hundred. August Surtman, Merced.

STATE HONEY PRODUCERS' EXCHANGE

The honey producers of California are anticipating a great year, and a large number of them have shown wisdom in organizing to cooperate in marketing the coming crop. The association organized is the California Honey Producers' Cooperative Exchange. The general manager is Charles B. Justice, who has been elected as general manager for 15 months from January 1, 1919. The board of directors comprises State Market Director Harris Weinstock; William Gunterman, Calexico; Willis F. Lynch, president, who is elected from the northern part of the state; Herman F. Mellen, Los Angeles; Charles G. Orr, secretary and treasurer; E. W. Horne, Riverside; Fred K. Howard, formerly Kings County horticultural commissioner, now manager of the Southern Valley Honey Producers' Cooperative Exchange. The executive committee consists of Messrs. Orr, Horne and Weinstock. The membership now numbers over 800 honey producers owning in excess of 100,000 colonies. The supplies for the present year have been contracted for, Manager Justice reportporting that there has been a saving of approximately $20,000 to members because of this cooperative purchasing. The trade will appreciate the new style packages which have been adopted by this exchange as a standard, and the exchange proposes to put up a standardized or uniformly graded pack which will win new customers.

TULARE DISTRICT INCREASES PLANTING

Increased acreage in the district around Tulare, to be put under cultivation this year for the first time, will amount to thousands and thousands of acres, according to ranchers coming to Tulare. They say that there is at least 50 per cent more new ground being broken up this year than ever before in the history of the county and that great increases in production will be the result. The new land is being devoted to a variety of crops, with alfalfa as the chief one and with large sections put into raisin grapes, which heretofore have been grown more extensively in the counties to the north of Tulare. Rice, which has been grown only in the lake region in the extreme western part of the county, is being grown this year on lands to the east, where alfalfa and figs are also being grown. Cotton acreage is extensive and promises to be much larger next year, as parties from the Imperial Valley are planning the erection of a gin in Tulare to handle this year's crop and offer a market for future production.

INTERNATIONAL BUYS P. & O.

The International Harvester Company, the largest manufacturer of implement and machinery lines in the world has just completed its line by adding plows, which heretofore it has not manufactured. This has been done through the purchase of the Parlin and Orendorff Company of Canton, Illinois, "largest and oldest permanently established plow factory on earth."

Under the terms of the purchase, the Harvester Company takes possession of the Parlin and Orendorff manufacturing plant and of the various branch houses and inventories on July 1, 1919. It will take over the business as a going concern and the Parlin and Orendorff organization will on that date become part of the Harvester organization and the business will thereafter be conducted by it and in its name.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Fistulous Withers

Please tell me through the Cultivator what to do for a mare that has a running sore on each side of her withers. They are high up and one is nearly on top. First noticed it about six months ago. The mare was never worked, is four years old and has a mule colt a week old. Have washed it and greased it but it will not heal.—Subscriber, Elsinore.

Fistulous withers are caused by a bruise from bumping against a low beam, a limb on a tree or when rolling on the hard ground. Any bump received on those parts is liable to start an abscess. There is very little circulation of blood to those parts so the healing is very slow. Also the cavity that contains the pus is below the opening so it can not drain well. The openings should be made larger so the cavity could be washed once a day by syringing an antiseptic solution to the very bottom. The modern scientific way of treating such cases is to make an anti-toxin of some of the pus and inject it into the flesh in some other part of the body. That treatment you would not understand unless you have kept pace with the modern surgical methods. You had better call the nearest veterinarian to see it once and show you how to handle it.

Pigs Ailing

I am having trouble with pigs. They are born with small teeth above and below where tusks are in grown hogs. They look well until about ten days old when they begin to droop and soon die. In shedding those teeth an abscess forms and the mouth becomes very sore. Now I am nipping them off with pliers and painting the place with iodine but save only a very small per cent of them. Have lost at least 200 pigs. Please advise me what to do and if there is any vaccine that will stop the trouble.—Subscriber, Calexico.

There must be something more wrong than sore teeth. If the sows are all right it is not cholera and I am inclined to think there is something wrong in the surroundings or in the soil. They may be getting it from dirt on the sow's udder. Wash the next sow all over just before or right after farrowing and put her in a clean place and keep her there until the pigs are at least four weeks old. Use plenty of lime about the place and use a good ship dip in the water when washing the sow.

AHEAD FOR ONCE

"Well, we've switched back to winter time."

"Yep."

"Did you turn your clock back the night before the change was due?"

"No, I waited until the alarm rang the next morning, and then I turned it back an hour. First time I ever beat the pesky clock."—Louisville Courier Journal.

SONG OF DEBORAH—VICTORY AND PEACE

Beat ye the cymbals and let the trumpets blow!
Said Moses to old Pharaoh; "Let my people go."
So sang Deborah and so sang Barak;
"Praise the God of Israel who brings my people back,
Those who went forth with will and those who tend the gate,
Those who sit in judgment and those who ride in state,
Those who ride the war horse and those who draw the sword,
Ye mighty men of valor, praise ye the Lord."

Gather ye, my children, arise, my soul, arise.
Heaven fought with us; the stars fought in the skies.
Gather ye, my children, from the river of Kishon,
Even that ancient river, the river of Kishon,
From Ephraim's mountain height unto the Jordan's shore.
Call Dan from his ships and Ashur from the moor,
Zebulon with his pen, and Issachar—even Issacher come back."
So sang Deborah and so sang Barak.
—Marian F. Thompson.

I WAS A LAND-ARMY FARMERETTE

By Marguerite Wilkinson in Farmer's Wife

LAST year, in American fields and gardens, many women not trained for such work filled the places of men going to war. And this year, because food will still be greatly needed and labor scarce, farmerettes, as we are sometimes called, will be needed to serve again. Perhaps my personal experience may be of interest to the real farm women.

In obedience to the regulations of The Woman's Land Army of America, I was examined by their physician, a woman, who found and duly certified that my general health was good and that my lungs, heart, spine and feet were sound enough for service. Then on a bright summer afternoon, I drove to Union County Farm Camp at Summit, New Jersey.

It was the largest camp of Land Army women in the state and there were normally about seventy-five women in the unit. It was, moreover, reputed to be one of the most efficient units in the country.

The farmettes lived in a large house at the top of a beautiful hill. I dismissed the taxi which had transported me, and stood, for a moment, looking down a long green slope, across a loveable valley to rolling country and overlapping hills beyond. The hills were many leagues away but I realized that I was looking at a very small part of Uncle Sam's front yard. On a tall flagstaff, in the foreground, I saw the small green and white flag of the Land Army and, above it, Old Glory. With many thoughts urging for notice, I turned and went into the large house, feeling something as a new girl feels at boarding school!

A charming little girl in overalls picked up my heavy suitcase and carried it for me with astonishing ease. She led me to the office of Miss Mabel Denton, the supervisor, to whose ability the girls owe comfort, well being and most of their efficiency.

Miss Denton took me to the dormitory which I was to share with seven other young women. It was a large, airy, well-lighted room. I pushed my suitcase under my bed and sat down on the edge of it waiting to see what would happen next.

All sorts of things happened. A young woman in knee-breeches brought me a pair of overalls and a blue working shirt.

"Did you find your cubby-hole?" said she. "No," I replied, wondering what it might be! It was simply a locker for our hats, coats, gloves, and other superfluous articles. This is only one of numerous "feminine" phrases current in the Land Army. A girl who is working the hand cultivator, for example, is said to be "pushing the baby carriage."

The hands of the clock worked themselves around to five and a great car with honking horn came rolling up the drive with a load of singing girls. They were coming home from the day's work in the fields. I had yet to learn how much vitality, even courage, a girl must have to come home singing. In quick succession, car followed car, until the whole house reechoed to the flat, heavy-booted tread of young women in overalls, who preserved in spite of dusty faces, grimy hands and a masculine costume far from immaculate, the indefinable air of being what they were—girls, not men. A certain spirit of strong, sweet womanliness shines through dust and disguise, showing them for what they truly are.

For an hour there was much running to and fro in the house, clamorous calling out for the use of baths and a heavy demand on the water supply. Then the girls gathered again, quite transfigured, wearing white ducks or fresh ginghams or cool middy blouses and bloomers, with prettily arranged hair and glowing faces. The metamorphosis was so complete that it was startling!

A bell rang and we went to dinner. The seventy-five young women seated at the long tables might well have been students at a boarding school or college save for two slight differences: they looked healthier and they ate their dinner with more energy and enthusiasm.

The dinner was excellent—meat, delicious fresh vegetables, bread and butter, salad and dessert. I was very thankful for I have a stubborn prejudice against poor food. And I had feared that the preverse feminine habit of excessive self-denial might lead these women patriots to limit menus rather too strictly. I heard of one unit in which the girls decided for reasons of patriotism and economy, doubtless, to purchase little fresh fruit and to use meat only once a week. This seems to me to be a mistake. Unpalatable or unsuitable food makes inefficient, slow spiritless workers and reacts on the health. The girls of the Land Army and all girls, are to be wives and mothers in our nation. If anything, these special workers need more food than they are accustomed to in their own homes, rather than less, for they are doing the work of manual laborers, the work of full grown men. Therefore, the fact that the food at Union County Farm Camp is both plentiful and good is one of the most practical and praiseworthy things that can be told about the place. The girls with whom I ate that day were not lean and haggard. They were rosy and well filled out. They laughed and sang from early in the morning until late at night; and their work was real and heavy.

After dinner, each girl spent the evening as she pleased. Working clothes were laundered to be ready for the next day; thermos bottles, which hold he daily ration of milk, were washed and aired; some sang; others read, others told fortunes, others sat and "visited."

At nine o'clock we were all in bed, "Good night, Peggy!" said one of my new fellow laborers. Surnames were not even mentioned among us and diminutives were considered in better taste than real names of three syllables.

"Good night, Polly!" I replied and by ten everybody was asleep.

As soon as I fell asleep, it seemed to me, I was awakened by the jangling of a wretched bell to discover that it was half past five and time for all good farmerettes to don overalls. With a clumsy effort I climbed into the long, stiff folds of my bifurcated khaki garment.

On my way down to breakfast I passed a large mirror and was obliged to admit to myself that not all farmerettes look beautiful in overalls but I soon learned every possible reason for their use. Overalls are because we cannot do without them. Any other costume would be plain foolish.

I was assigned to duty in the home vegetable garden of the camp, and I promptly fortified myself by eating a large breakfast of fruit, cereal, coffee, bread and butter, and eggs. Then I went out to meet the squad leader who was to put the new girls through their paces.

This squad leader is a girl chosen for her competence, to direct the work of the squad. She is not, in any sense, a "boss." She does the hardest or most disagreeable tasks herself, sparing the newer and less competent girls as much as possible; she plans the work so as to make it easy as possible for the rest; she helps the backward

time; she listens to complaints or criticisms or requests that a farmer may have to make, reporting them in the evening to the supervisor of the camp, she sees that enough luncheon is provided for her squad.

It is also the squad leader's duty to hurry any girl who seems lazy or wilfully slow. Owing to the patriotic spirit of the girl, this is seldom necessary. Sometimes the squad takes upon itself this disagreeable duty, by singing in no faint tones such a suggestive song as this:

Get a wiggle on, get a wiggle on,
Don't stand there with a giggle on,
Get a wiggle on, get a wiggle on,
Don't stand there all day!

At seven o'clock the squad leader called us, and we went to the barn for tools. Down the hill we followed her, taking with us hoes, rakes, spading forks, a barrow and cultivator. There were about eight of us in the squad, most of us new. We were set to weeding a large patch of ground covered with a heavy growth of grass. Down on our hands and knees we pulled and pulled. At the end of half an hour I was sure it must be nearly lunch time! We kept on pulling. Our hands were cut and blistered. Our backs ached but we kept still about them. No one wanted to be less of a sport than her neighbor. No one was willing to be the first to groan.

When we thought that we simply could do no more, we were told to hoe the smaller weeds out and rake them into piles. This was a change of position and did very well for a while.

Every time I hoed a weed I seemed to catch a stone, also, on the blade of the hoe! And when I raked, the stones followed the weeds.

Next I was directed to get the wheelbarrow, collect the piles of weeds and carry them to a big rubbish pile at one end of the garden. The stones followed the weeds on to the spading fork and went into the wheelbarrow. They made the load very heavy and when I trundled the big barrow across the lumpy ground I wondered whether it was worth while to maintain an ideal of stoneless well-pulverized soil! How much I had to learn. My admiration for farm people shot up.

I trundled my heavy loads until the squad leader called a halt.

"Is it noon?" I asked. She laughed. "About ten o'clock," she answered. "A good many girls are new today, and we'll all eat a sandwich and get a drink of water and rest five minutes." I felt extraordinarily humble.

Work began again and continued without intermission until noon. Frequent changes were made with the idea of resting our still soft muscles. We dug, we planted, we fertilized, we pushed the cultivator, we weeded on our hands and knees, we learned how to use the tools with force and precision. At noon, there was an ample lunch and a long hour and a half rest. I took it flat on my back.

When I went back to work I felt like a cripple but I kept the pace until half past four, when we tramped slowly up the hill again, very much wiser girls than we had been in the morning, and very weary but not a whit cross or discouraged. I took a bath and went to bed until dinner time. At dinner time I hobbled into the dining room with very rebellious muscles and after eating, at once hobbled upstairs to bed. I stayed there until the dreadful bell announced another morning—and a good morning.

(Continued next week.)

HOUSEHOLD QUERIES

Soft Soap

Can you publish recipe for soft soap using lye made from wood ashes?—Subscriber, El Cajon.

Of course you might use the recipe given on the cans of commercial lye, substituting the lye made from wood ashes instead, but here are some directions given in "Farm Questions Answered," published by the Cultivator.

"Ashes are placed in a barrel on an inclined waterproof bottom with strips nailed or channels gouged in it to conduct the water which leaches through the ashes to a big kettle or crock set under its edge. The bottom of the barrel should be covered with clean new straw and barrel nearly filled with ashes and the water poured on top. As it leaches through it comes out a straw color and its strength was tested in our grandmother's day by the use of a fresh egg. If the egg floated, good; if not, the lye was poured back through the ashes again. The quantity of lye and soap greases, so far as we remember, was entirely a matter of experience. After boiling in a big cauldron the surplus lye and the bones settled to the bottom, and if the soap was too thin and watery it was thickened by adding water. We recall that this soft soap was rather caustic or had an excess of lye."

Kumquat Preserves

Will you please publish a good recipe for kumquat preserves?—Subscriber, Upland.

We have had no experience in making kumquat preserves and are unable to find any recipe. We do, however, find recipes for canned and candied kumquats, which we give below, and these may have suggestions that will be useful. It doesn't strike us that the canning recipe would make very palatable fruit as the kumquat rind is so strong, and would suggest that for preserves it would be better to treat the fruit first as in first paragraph of the candied recipe, then follow ordinary procedure for making fruit preserves.

We will be glad to have readers who have had experience help us out.

Canned Kumquats—Wash and pack in jar. Make a syrup from half pound sugar and pint water, fill this in the jar, cap and clamp, and boil one hour.

Candied Kumquats—Boil kumquats in slightly salted water one minute. Cool, drain and then boil in fresh water one minute. Throw off that water and boil again in fresh water five minutes. Drain.

Measure and add a little less sugar than fruit, enough water to make a syrup to cover. Simmer two or three hours, when they should be clear. Remove and when slightly dry roll in sugar.

Book Review

HOUSEWIFERY

"Housewifery," a manual and text book of practical housekeeping by Lydia Ray Balderston, instructor in housewifery and laundering, Teachers College, Columbia University, published by Lippincott Co., Philadelphia, at $2.00 net.

"The poetry of life always has a practical side to it, and most practical affairs rightly worked out are full of poetry."

"This handbook of practical housekeeping is offered to women in the hope that it may show in some measure how to reduce tasks in the home and how to save time, money, and energy. This book will be of direct help to the many women who do their own work or supervise household employes and who are seeking guidance by consulting reference books as other professional workers do. The book is the outgrowth of many years of experience in housekeeping and in teaching housewifery to groups of practical housekeepers, with emphasis upon the technical processes of the home. It is designed to help not only the individual home woman but to serve as a test for study groups of rural extension and other clubwomen and in the housekeepers' courses given by schools and colleges. Any further study of the sciences, directly or indirectly connected with housewifery, may be carried on by means of the references suggested throughout the book."

The above is from the preface of the book and indicates the general line of its contents. There are, however, 13 chapters touching upon housewifery as a business, plumbing, heating and lighting, two chapters given up to equipment and labor saving devices, supplies, furnishings, storage, cleaning and care, renovation, disinfectants and fumigants, household pests, etc. While this book is intended as a text book to a certain extent, it is so filled with practical hints that every housewife will revel in its contents.

"The hired laborer labors on his own account today and will hire others to labor for him tomorrow."—(Lincoln.) Buy W. S. S. They will help in 1924 to give the children an education; to buy a home; provide insurance, etc.

STEINWAY

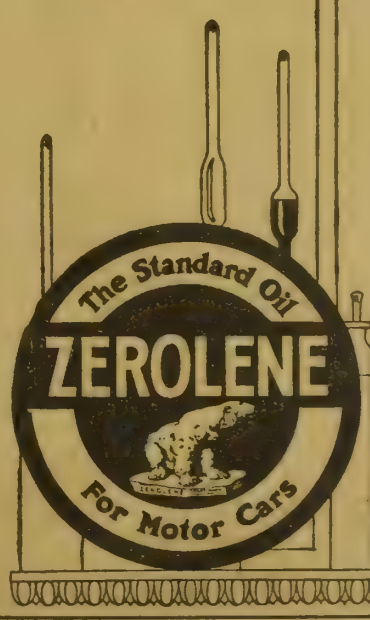
The Pre-eminent Piano

The Steinway is the one Piano known and used throughout the world. Wherever Pianos are sold, the Steinway is carried by the leading Piano Dealer as his leader. The Steinway is the Piano used by all the world's greatest pianists, vocalists and instrumentalists.

The Steinway is the piano used by the best teachers of music—on the Pacific Coast over a thousand teachers use the Steinway.

The Steinway is the Piano found in the homes of lovers of music, of people of discriminating tastes, and of those who purchase only the **Best.**

The Steinway is universally acknowledged the **Standard** by which all Pianos are judged.



There must be a reason why the Steinway is so pre-eminent. Indeed, there are scores of reasons why—mere words here cannot adequately express them—but if you will drop in at any of our stores, we will be pleased to show you why.

In spite of its manifest superiority, the prices for Steinway Pianos are no higher than asked for competing makes. We gladly arrange convenient payment terms.

Pianos and Player Pianos of All Grades—Player Rolls.

Belgian hares 14.

LIVE STOCK

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Beginning about April 21 the local market for beef cattle made the first decline in price of this season and since that date each subsequent market day has recorded either a weakened condition or a further decline. The present weak market does not seem to be the bottom that will be reached according to local killers. The available supply of cattle ready for market exceeds the local outlet for dressed beef.

It is true that many trainloads of California cattle have been shipped to Eastern markets and many more will be shipped but this movement has not had the expected stimulating effect locally. The receipts here consist largely of culls from the feed lots that are shipped Eastward and the outlet for this grade is limited.

Cattle on the large Eastern markets also has shown a steady decline since the first of May.

The receipts of hogs in Los Angeles continue very light and prices are firm at the high level existing for the past month. Local killers only buy hogs when they are needed to fill orders on hand and do not welcome any increased business while the live hog prices are high.

Liberal receipts of spring lambs with no increase in the demand for the dressed product is the factor that causes this market to continue weak and lower. The best quality lambs are being shipped to Kansas City and Omaha and quite a lot of culls from these shipments are received in this city.

Wethers and ewes in sympathy with lambs are also weak.

Cattle:
Good steers .....11.00@11.50
Medium steers .....10.00@10.50
Common steers .....8.50@9.00
Good cows .....9.00@10.00

No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No .3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 43.00. Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 20 tons, 41.00 per ton; 10 tons, 41; 5 tons 41.50; less quantity, 42.00; smaller lots higher proportionately.

HAY

Under date of May 17, Scott, Magner & Miller says:

Receipts past week 1587 tons. The market throughout is dull and very little interest is shown among dealers, hay being moved from the tracks with difficulty, with very few track sales.

Considerable first cutting alfalfa has arrived, some of very good quality and free from foxtail, grasses, etc., while othar cars are heavily charged with foxtail and foreign grasses, and some of it has been baled prematurely which has resulted in the hay heating in the bale.

Alfalfa arriving in order has been sold at prevailing prices, although the demand has been quite light; but the hay that has arrived in bad condition has been most difficult to place and dealers receiving same are laboring under adverse conditions in disposing of it as such hay cannot be piled in warehouses.

This causes a heavy loss to shippers and we feel we must again caution farmers not to bale their hay before they are sure it is thoroughly cured and to take no chance whatever in this regard as it will be very costly to them in the prices obtained should the hay arrive in bad order.

A few cars of new volunteer oat hay arrived during the week and sold on a basis of $9.00 to $11.00 per ton to the farmer at shipping point. This hay was of excellent quality with the exception of some carrying considerable burr clover and this sold at the lower figures.

Very little is going on in the country districts and few if any sales were made during the week. Most dealers are holding enough old hay to carry them along for some time and prefer to wait its disposition before beginning on the new crop.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers' charges of cartage, commission and handling expenses must be added according to conditions.

Fancy Wheat Hay
(light 5 wire bales).....19.00@21.00
No. 1 Wheat or Wheat and Oat Hay .....16.00@18.00
No. 2 Wheat or Wheat and Oat Hay .....12.00@15.00
Choice Tame Oat Hay.....17.00@19.00
Other Tame Oat Hay.....12.00@15.00
Wild Oat Hay.....11.00@14.00
Barley Hay .....11.00@14.00

Citrus Markets

Los Angeles, May 21, 1919.

After six months of successful marketing the navel season closes with prices if anything rather above the average. During a portion of the time abnormally high prices have prevailed. Seedlings, St.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

Poultry, Wool, Beans, Honey
and other Farm Produce
Let Us Handle Your Shipments
Quick Sales Prompt Remittance

W. C. Price & Co. 244 Clay St., San Francisco

Mikes., Sweets and other fruits supplying the market during the end of the navel season have all commanded good prices, and for the first time California grapefruit may feel satisfied with its general treatment. Valencias are beginning to take the market with prices which occasionally reach above the $6.00 mark, the greater number of sales, however, running around $5.00.

Lemons are not commanding such high prices but a very satisfactory condition permits regular movement of fruit at fair prices.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 21,060 cars, lemons 5059, total 26,219. To same date last season; oranges 9350, lemons 2698, total 12,048. Central California this season; oranges 3804, lemons 354, total 4158. Last season to same date; oranges 2482, lemons 115, total 2597. MARKET NOTES

The onion harvest in the Coachella Valley is about half over. Prices received compensate for short crop. Growers blame shortage on onion thrips.

Alameda County is furnishing about the only stocks of green peas; growers are getting around $4.00 per 70 pound sack.

Colma district of San Mateo County has nearly cleaned out its potatoes. Garnets are now going by straight carloads.

Strawberries: Crop Fresno County 80 per cent of normal, yield 240 crates of 20 pints each. Few straight cars being shipped this year. Condition crop Placer County reported excellent. Three hundred crates per acre being expected. Coast counties crop producing heavily and ripening rapidly. Canners have already begun taking supplies. Deliveries to canners general the ensuing week. About 11,000,000 pints expected from this district this year; 35 per cent to canners.

Carlot shipments of tomatoes are expected to start from the Merced district about June 10; 220 acres are planted this year, slightly over 1918's acreage. In San Francisco district planting of tomatoes is progressing favorably in all directions but many growers are still up in the air as to quantity they intend to put out. Canneries are declining to make contracts claiming evidently that enormous quantities of canned stock are being carried over from last season on account of changed war conditions. Growers will not plant freely without cannery contracts and lacking these, acreage may be decreased materially.

A shipment of cattle for export to Belgium was in the Jersey City stock yards recently. The shipment was bought partly at Chicago, Buffalo and Jersey City and consisted of 147 bulls and 23 steers.

One of the large producers and feeders of cattle in California estimates that more than 20,000 cattle will be shipped Eastward from California this season as compared to approximately 15,000 shipped in 1918.

Shipping of surplus fat cattle from the Imperial Valley has begun. Fifteen trains of stock will be shipped to eastern points between now and July 1, according to reports from the Imperial Valley Live Stock Association. This, it is said, will relieve the congestion and also enable live stock growers to realize good returns for their product. A train of 25 cars of fat cattle left Brawley April 28 for the Kansas City market and 47 cars, made up in Los Angeles County, left here April 19 also for the same market.

Potato growers are holding for high prices for the clean up while buyers are moving cautiously and shipping considerably less stock than during the previous month. The heavy movement up to two weeks ago has largely been put into storage in California which is taken as an indication that supplies will be so plentiful that extravagant prices will not prevail on the Pacific Coast.

Late cabbage in Fullerton district is yielding better than was at first expected. There are but a few seeders and heads are of good size. The county shipped 30 cars the first week of May. The quality in general is fine.

Late estimates show 16,000 acres planted to cantaloupes this season in the Brawley district, with 10,000 acres in the San Joaquin Valley.

Imperial Valley has shipped over 1000 cars of lettuce this year.

Cabbage shipped by the Orange County Produce Growers Association is now netting to growers about $80 per ton.

Carload shipments of onions from Thermal district well started.

Strawberries are being shipped East from Los Angeles at the rate of three or four cars per day.

There is a large acreage of Stone tomatoes in the Fullerton district of Orange County.

AVOCADO GROWERS MEET

The California Avocado Association met in Pasadena May 9-10 and elected directors and discussed matters of interest to 350 avocado growers. The attendance was even larger than anticipated, over 140 being at the banquet at Hotel Maryland. The three years' directors elected were: Y. F. Yaggy, Santa Barbara; G. T. Stewart, and W. L. Hardin, Los Angeles. The name of 26 new members were placed on the roll. These new members represented 17 different communities of Southern California. The membership now aggregates over 200. The exhibit of avocados showed something like a dozen varieties, many of them new, some specimens tipping the scales at two and one-half pounds. The secretary of the association is W. L. Hardin, 623 South San Pedro Street, Los Angeles.

A NEW BLAST TORCH FOR SNAIL ERADICATION

The blast torches for use in the campaign against the snail, Helix pisana, to be conducted by the state commissioner of horticulture and the county horticultural commissioner of San Diego, have arrived and been given a preliminary tryout by D. B. Mackie, the southern field deputy of the state office.

The apparatus is a modification of the vaporizing type of foundry torch and was constructed especially for this work from specifications furnished by Mr. Mackie who has been working upon the development of a torch suitable for this purpose. The flame produced gives off a heat of 2900 degrees Fahrenheit. This flame can be regulated to suit the needs of the operator. The apparatus is equipped with a steel pressure tank and two lines of hose feeding the burners and operates under 70 to 100 pounds pressure. Kerosene is utilized for fuel. It may not be generally known, but kerosene has 116,000 thermic units per gallon against 83,870 for gasoline or distillate. In the present work, which will be under the immediate supervision of Commissioner Gorton, it is planned absolutely to follow, insofar as possible, every foot of ground that shows the presence of the pest. Periodic inspections will be made and the operations repeated from time to time as the needs of the occasion demand. It is believed that it will take a pretty thrifty snail to live through this campaign.

PIONEER IN LEATHER

Over 19 years of success as manufacturers and distributors of leather goods and other articles is marked by the removal of the Los Angeles wholesale department of Lichtenberger Ferguson Company to new quarters at Third and Los Angeles Streets, Los Angeles. The wholesale department now occupies the entire building on the northeast corner.

The company was established in 1900 under the name of Los Angeles Saddlery & Finding Company. The principals at the head of the organization today were associated with the company in the beginning, and include Louis Lichtenberger, president; Clarence Ferguson, vice president, and George W. Lichtenberger, secretary. These men enjoy a wide acquaintance among ranchers.

At the present time, Louis Lichtenberger is on an Eastern trip and is spending several weeks at the Norwalk Tire & Tube factory.

CASH

FOR

Your Poultry Products

200,000 More Broilers Wanted

(Ten Reasons Why the National Poultry Co., Inc. Should Receive Your Poultry Products

First: The National Poultry Company has set a standard and established a reputation which must be maintained. It will be maintained, because the same principles that have given character to our establishment since we were doing business in a 25 foot, one-story building are maintained in our modern plant.

Second: The National Poultry Company's reputation is built on fair dealings, honest weights, and quick remittances, covering a period of ten years. Ask your own banker about us.

Third: This explains why the National Poultry Company's methods stand out so strongly, why we were unanimously chosen by the Poultry Producers' Association of Southern California, a body of 530 leading poultry men, to exclusively handle 100,000 of their broilers.

Fourth: This is why thousands of California, Arizona, New Mexico and Nevada producers ship us regularly every season.

Fifth: Because we are the largest exclusive wholesale poultry plant on the Pacific Coast. Our capacity is 32,000 live broilers on feed at one time. We have our own cold storage plant on our premises. The only poultry firm in Los Angeles having trackage to the door for handling carload lots.

Sixth: It has been our conviction that in the poultry business, as elsewhere, patronage will always go where it is best treated.

Seventh: It has been our conviction also that the more the producer gets out of his shipment, the better showing we can make for ourselves in increased sales. The new business method is the increased volume of business on a small margin of profit.

Eighth: The National Poultry Company realizes its obligations to continue this same method with increasing usefulness to producers.

Ninth: It is unthinkable now that we should imperil our position by abandoning the policy that has made us.

Tenth: The above methods have always been the standard which J. Will Blackman, president of the National Poultry Company, has applied in building up this business.

Muscle Doesn't Make Money

Man muscles or horse muscles are no longer profitable on a farm. Farm with power and brains—not with plodding and brawn.

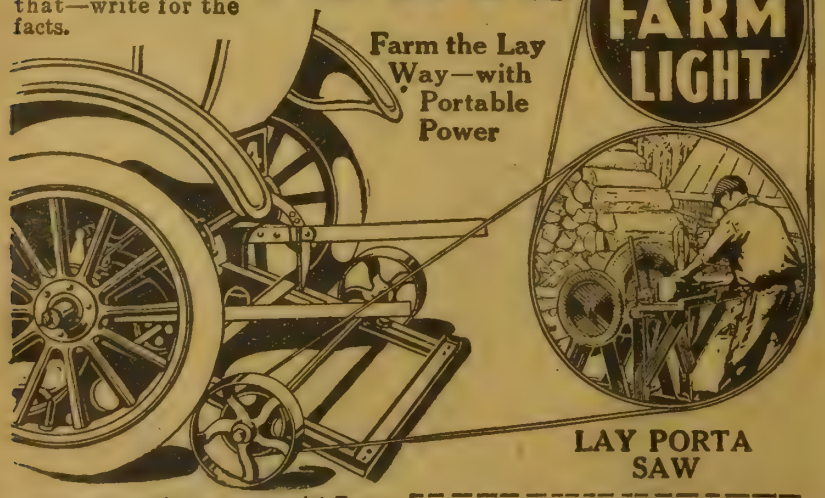
Let us tell you how to invest the cost of a laborer in modern power implements which will make you independent of labor for the rest of your life.

There's a great engine in your automobile that can do a lot of your farm work if you harness it. Lay Porta Power is the harness. It lifts the rear axle so the tires rest against two pulleys mounted on a shaft with a belt pulley in the middle. There's almost literally no wear on tires.

You can move the power where the work is; down to the wood lot to run a Lay Porta Saw; out to the dairy to operate a Lay Milking Machine, a separator or a churn; up to the well to drive a Lay Porta Pump; then back to the house to charge the electric batteries of your Lay Farm Light outfit. Release two levers and the car's ready for family enjoyment.

You can buy the whole Lay equipment for only a little more than the price of one stationary engine —Lay Porta Power; Lay Porta Saw; Lay Porta Pump; Lay Concrete Mixer and Lay Farm Light. Each machine is sold separately. All are guaranteed to satisfy.

Don't guess this or that—write for the facts.



LAY PORTA POWER

LAY PORTA MILL

Helpful Hints from Rancho del Martino

By Jean A. Koethen

EVERYBODY knows the Rancho Del Martino at Downey and its hospitable owners, and every White Leghorn breeder and egg farmer knows Mrs. Martin's Leghorns. I have often wondered myself what was the secret of Mrs. Martin's sucess as a breeder. On a recent visit to the ranch I discovered it. Breeders are born, not made, and Mrs. Martin is a born breeder. She has loved animals and birds all her life. " I never saw a horse I couldn't ride", she told me. She calls all her birds by name, knows every little characteristic and idiosyncrasy. As you might recognize the son of one of your school friends of 25 years ago by a dimple or an inflection, Mrs. Martin recognizes birds of various blood lines by the curl of a feather—or something else. I couldn't learn to do it in a hundred years. She knows how without learning. She says that when she first began to breed Leghorns she used to sit in the different runs hours at a time just studying the birds—birds that looked exactly alike to most of us. She could see that they were different, and that is the way she learned to breed for points.

The new cockerel house at the ranch is a beauty. Imagine a long building with an alley running down the middle and 18 little pens on each side, pens just large enough for two or three birds. Most of them contain only two, a male and a female, for here is where Mrs. Martin tries out her matings. She doesn't guess. When a cockerel has proved that he can throw show birds she never lets him go, but he has to prove it first.

Solid Comfort
These chicks have perfect shelter from wind and rain as well as unlimited range.

A Model Brood Coop

Most of the equipment of the Rancho del Martino is of a special character and would not be suitable for use on a farm, but the chick coop is one that could be used anywhere for chicks brooded by hens. It is two feet deep, three feet long, two and a half feet high in front and two feet at the back, and is built of matched lumber that does not admit of a crack anywhere. The floor is tight and smooth and covered with straw, and the slats in front are just the right distance apart to give the chicks liberty and keep the hen where she is most useful. The roof is of shakes and a little board platform before each coop keeps food and water off the ground.

Wire coops 2 x 3 x 2 fit the front of every coop and can be used when required, but this year the coops, some 30 or 40 of them, are set in a row facing the south and just outside the fence which separates the driveway from the big lawn. With the soft straw to cuddle on inside their box of mash and fountain of sour milk at the door, and a chance to run on the lawn, these chicks are literally in clover. Practically all the chicks on the ranch are raised by hens. Hen brooding may not be practicable everywhere, and on commercial ranches satisfactory results are attained by brooding a thousand chicks at once under the same hover, but the finest chicks, Mrs. Martin believes, are raised by hen mothers.

Proper Equipment Pays
Breeding Yards at Rancho del Martino.

Two Good Mashes

Naturally, Mrs. Martin does not tell how she feeds her chicks. She did give me, however, two good mashes which she has tried out and found excellent for egg production. The first is one especially adapted to the era of high prices and limited variety we have just been passing through: Wheat bran, 600 pounds; shorts, 500 pounds; ground oats, 300 pounds; ground barley, 350 pounds; Meatine, 100 pounds; ground bone, 100 pounds; charcoal, 50 pounds; salt, 10 pounds.

These proportions are calculated for

The Inexpensive Tractor For Small Ranches

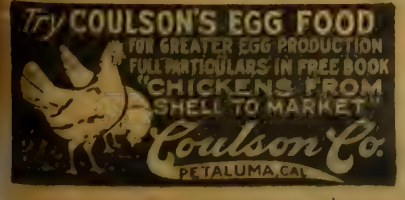
Motors Equipment & Tractor Co.
1310 South Grand Ave. Los Angeles, Cal.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.
Write AERMOTOR CO., 2500 Twelfth St., Chicago

Save the Baby Chicks



Our book, "CARE OF BABY CHICKS," and a package of GERMOZONE are the best insurance against chick losses. Those formerly losing more than half they hatched now raise better than 90 per cent. To you who have never tried GERMOZONE, we will send postpaid, book and package as above. You pay, if satisfied, 75c; 60 days' trial. We trust you.

Druggists and seed dealers sell GERMOZONE, the best poultry remedy and preventive. For old and young,—bowel trouble, colds, roup, musty or spoiled food, limber neck, chicken pox, sour crop, skin disease, etc. Sick chicks can't wait. Do it now.

a ton of mash. When shorts cannot be obtained Mrs. Martin suggests the substitution of 100 pounds each of corn meal, alfalfa meal and soy bean meal. She especially commends the use of alfalfa meal in place of other ingredients that are not available because alfalfa meal gives needed bulk and good color to the egg yolk.

The second mash, which is especially suited to Leghorns, consists of wheat bran, 600 pounds; ground oats, 200 pounds; Sure-milk, 400 pounds; alfalfa meal, 100 pounds; Darlings beef scrap, 200 pounds; corn meal, 300 pounds; fish meal, 100 pounds; ground bone, 100 pounds; charcoal, 25 pounds; salt, 10 pounds.

The scratch feed to accompany either of these mashes consists of 300 pounds wheat, 100 pounds oats and 100 pounds corn, which is reduced in July and August to 50 pounds.

How to Get Pullets

Nearly everybody who raises chickens is anxious to hatch as large a proportion of pullets as possible. The Martins do not care for pullets. They rather prefer a preponderance of cockerels. In order, however, to please those of their customers who are anxious for pullets they mate special pens for the purpose. In these pens a single male is mated to all the hens he can possibly take care of, which is usually about twenty. The age of the male does not seem to matter, it is the fact of the great preponderance of females in the pen that is responsible for a like preponderance of females among the chicks hatched.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 2, 1919.—Report for the twenty-sixth week ending May 1, 1919.

With the close of the twenty-sixth week. the eighth laying contest at Storrs is half over. During the first half of the contest last year the best weekly pen record was 62 eggs. In the competition now running, Chickatawbut Farm's White Rocks from Canton, Massachusetts, hold this record with a yield of 63 eggs in the twenty-sixth week. The total for all pens for the week amounted to 4399 eggs, a yield of nearly 63 per cent. This is better than for any previous week, and nearly 100 eggs more than the five-year average for the twenty-sixth week.

From the present outlook, the hens in the Storrs contest will have to hustle if they make any new records for the year. At the end of the first six months last year a White Wyandotte had laid 156 eggs, and two years ago a Barred Rock during the corresponding time had yielded 146 eggs, whereas the best individual record to date in the current competition is held by Rhode Island Red Number 402, that has laid 142 eggs. In the past six months of the last contest the best pen of Wyandottes, ten birds taken together, had laid a little over 1000 eggs, but the best pen record for the first six months this year is held by a pen of Barred Rocks that have laid 961 eggs. In previous years the birds have averaged to lay during the first six months of the contest about 42 per cent of their total yield. On this basis the one thousand birds now competing at Storrs may be expected to lay approximately 145 eggs each before the end of the contest in October.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 961; Laurel Poultry Farm, 874; Ingleside Farm, 752.

White Wyandottes

Obed G. Knight, 912; W. Bradley, 813; Patrick F. Sullivan, 810.

Rhode Island Reds

Laurel Hill Farm, 930; Deer Brook Poultry Farm, 974; Chas. H. Lane, 782.

White Leghorns

A. P. Robinson, 828; Hilltop Poultry Yards, 782; S. G. McLean, 780.

Miscellaneous

Pequot Poultry Farm (R. I. Whites), 757; Chickatawbut Farms (White Rocks), 696; H. A. Wilson (White Rocks), 658.

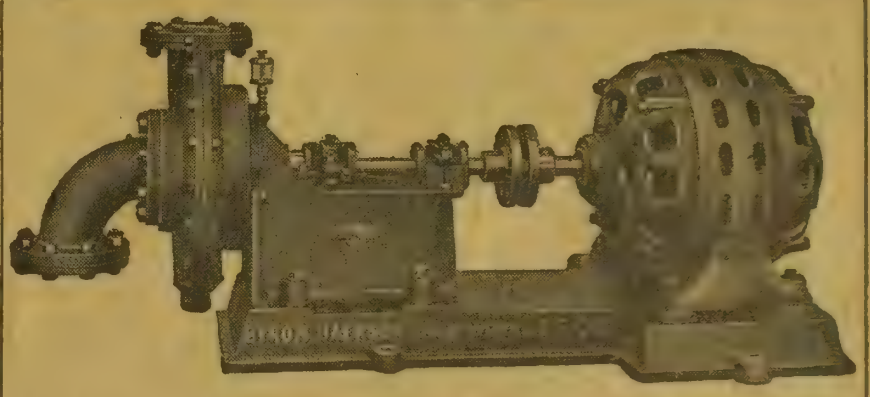
Stop those Leaks

THE easiest and quickest way to repair leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks instantly without laying up the car. No mechanical experience is required—all you have to do is remove the cap and pour the liquid into the radiator.

No tool kit is complete without a can of Johnson's Radiator Cement. It overcomes the inconvenience of laying up one's car. A half-pint is ordinarily sufficient for a Ford or other small radiator—for larger cars use a pint.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.



Quick—Efficient—Harmless

Johnson's Radiator Cement contains no powder, cement or anything which can coat, clog or interfere with the efficiency of the cooling system. It will ordinarily seal a leak in from two to ten minutes.

Use Johnson's Radiator Cement for Automobile and Tractor radiators and for sealing leaks and cracks in boilers and water jackets of all kinds.

Insist upon your dealer supplying you with Johnson's Radiator. Cement. Write for our folder on "Keeping Cars Young"—it's free.

You Wouldn't Have Your Best Horse Poorly Shod!

Unsuitable tires will cripple an automobile as surely as poorly fitted shoes will lame a horse.

Your car must be properly shod to give its best and most economical work.

Give it tires *you know* are exactly suited to its use—tires that are perfectly adapted to the roads you travel.

The line of United States Tires includes tires to meet any possible need. It is the only complete line built by any tire manufacturer.

No matter what type of car you drive or what kind of roads surround your farm, you can find United States Tires that will fit your needs to a nicety.

There are five separate types for passenger cars and both pneumatic and solid for trucks.

The nearest United States Sales and Service Depot Dealer will gladly assist you in making your selection. He will save you lots of those good hard dollars you get from those fields of yours.

Let him help you.

Bountiful Crops in a Bountiful Year

Like the teeth of a buzz saw!

YOU'VE stood in awe before a buzz saw and watched it literally tear its way through a piece of material. Being driven at such a terrific speed, it produces results that are almost startling. But if you were to run the buzz saw at a much slower speed, and take some of the keenness off of the teeth, then you would have an action very similar to that of road bumps, ruts and rough places as they rack, strain and wear out your Ford Car or Ford One Ton Truck.

The thousands of sudden, heavy impacts, while not sufficient to cause instant breakage, yet cause great and unnecessary wear on all parts, particularly the power unit and the tires.

It has been proved by nearly a million Ford owners that by properly cushioning their machines against road shocks and vibrations with Hassler Shock Absorbers, that you save at least 30% of the ordinary tire and repair expense, and that your Ford's depreciation is decreased a like amount. You also obtain considerable increase in gasoline mileage, due to the smoother running. Hasslers prevent squeaks, rattles and deterioration, for the spiral, conical springs of chrome-vanadium steel compress on either upward or downward movements.

In addition to all of these savings you have such greatly increased comfort that your Ford Car or Truck rides and drives as well as the highest priced heavy models. It steers easily, holds the road, travels safely at high speed, and the general and good satisfaction you derive from its use is increased astonishingly by Hassler Shock Absorbers.

Hassler Shock Absorbers can be put on in a very few minutes, either by you or your garageman. There are two types, one for all Ford Passenger Cars, the other "Double or Twins" for the rear of the Ford One Ton Truck.

10-DAY TRIAL OFFER

Don't ride without Hasslers because some one tries to discourage you. They are a quality product—worth their price. The Hassler dealer in your vicinity will put them on for 10 days' trial. Your money refunded if you say so. Write for name of dealer and Trial Blank.

The conical springs set at the angle shown prevent sideway and allow for the most resilient downward action. The springs compress on either upward or downward movements—do not stretch out of shape—do not allow up-throw. Hasslers last as long as the Ford and make it last.

California Cultivator

Vol. LII, No. 22 Los Angeles, May 31, 1919 One Dollar Yearly

A Prosperous Year for California Growers

THE fruit grower is certainly coming to his own this year. Almost every section gives indications of big crop of high quality fruit, and prices at which larger buyers are willing to contract for future delivery are entirely satisfactory to the most exacting growers. The one most important question at this moment is how may we thin the fruit, irrigate, cultivate, and cure so as to produce a product which will command the highest of these high prices. This the grower is settling for himself, or endeavoring to, for occasionally is heard complaint as to how competent help may be secured, but this is not a question which the grower can discuss for he simply must secure the help which will secure attention and cultural conditions required.

Clippings from the press of the Coast are so intensely interesting that we give herewith a number of them for the benefit of our readers. The first is from

Pacific Coast Packer

Prices offered for the coming peach crop have advanced greatly during the past week or ten days. The San Gabriel Fruit Association, with 158 members, representing an acreage of 2900 acres in the San Gabriel Valley and in the Whittier section, has fixed its price for peaches at $75 a ton. The San Fernando Peach Association has fixed prices upon a similar basis and it is said that the canners who handle 80 per cent of the California peach yield are meeting the advance in price.

Little more than two weeks ago the canners in localities near Los Angeles were offering $50 to $55 a ton for peaches, the difference in price depending upon the variety of fruit. Now the new Stern cannery at Wineville is offering to buy peaches at prices ranging from $60 to $75 per ton for delivery at the cannery. The Golden State Canning Company also has contracted to buy at like prices.

It is reported that the canners had learned that the demand in Europe for canned peaches is going to be large this coming season, and they found that the new cannfng companies in the market this year had already contracted for such large quantities that they had to offer extra inducements to the growers.

The general situation is given in a circular issued by the

California Peach Growers, Inc.

Will now accept orders new crop "Practically Peeled Peaches," cartons only. Peaches per case, 11 ounce, $6.25; two pound, $8.50; five pound, $10.25, f. o. b. sellers' plants. Fall shipment sellers' option. Sales must be to regular jobbing trade and subject to our confirmation. Will quote bulk peeled and unpeeled later soon as crop conditions are settled.

Last year's prices were as follows: 11 ounce case, $5.40; two pound case, $6.40; five pound case, $8.00. There are 48 11-ounce packages to a case; 24 two pound packages and 12 five pound packages.

Clippings from Press of the Coast Show Bumper Crops, Long Prices

These prices are f. o. b. factories California common shipping points, September, October and November shipment our option, and are guaranteed against our own decline until January 1, 1920.

Our reason for not quoting at this time bulk peeled and unpeeled peaches is that crop conditions are not such that we can, with any degree of safety, accept orders for bulk peeled or unpeeled.

* * *

In small fruits the interest is also intense. In the Northwest where large quantities are grown ten cent prices are obtained.. Dispatches refer as follows to

Strawberries

Asking prices for strawberries are high this year. One packer has been bidding in the neighborhood of ten cents a pound and another buyer for the fresh fruit market has been unable to get berries at $2.50 per crate. Imported stock is now retailing at 25 cents per quart. One packer has offered 11 cents per pound for raspberries, but this is not expected to be the prevailing price, a nine cent quotation being nearer the probable average, it is believed. It is the belief of one of the principal buyers that the high price for strawberries this year will cause the planting of a much greater area within the next year.

In California:

Lodi Sentinel

California fruit growers have struck gold. Barrels of the yellow metal wait the delivery of crops. It is the biggest "strike" in the history of the industry. To use a mining term, values are assaying $250 to $400 a ton for dried fruits.

Imagine a small ten pound box of figs selling for $4, or a four basket crate of apricots for $7, or a chest of strawberries for $25. These are just a few of the tremendous prices that have been witnessed in San Francisco in the past few days.

We have got to feed Europe and at the same time speculation is running wild. Crops are large. Everything promises a bountiful yield. But there will not be enough to go around, judging from the way canners and packers have it figured out. For they jumped in at the start and contracted for everything available and swept the growers off their feet with astonishing prices. In the meantime prices are steadily rising.

* * *

As to apricots, one of the big producing counties is Ventura. One of her papers says:

Santa Paula Chronicle

The market price for the dried apricot crop of this region is a record breaking one. Several weeks ago many sales were made at 17 cents per pound and this was considered a fine price. However, the price has steadily advanced until a big lot has recently been sold here at 21½ cents per pound and an even higher price is reported as having been paid in Ventura.

The apricot grower is surely the man of the hour this season.

Down in Orange County:

Santa Ana Register

With the price of dried apricots up around 21 cents, and steadily climbing, and with an estimated increase of some 800 tons of fruit this year, in this section of the county, over last year, apricot growers are feeling well satisfied with the prospects before them. The outlook is the same, practically, throughout the entire state. Last year was a rather poor one for apricots. The price reached about 12 or 13 cents. The result was that a good many of the orchards were taken out.

This year, however, there is a very good crop in sight. There appears to be little or no scale and the fruit should be first class. A large percentage of the crop has been already contracted for. Most of the fruit is dried, the remainder sold green to the canneries. All but a few of the growers are equipped to dry the fruit and market it this way, and the amount that is sold green is comparatively small.

Pits are bringing around $40 and $45 per ton. This is a large increase over last year's crop. With good market conditions, and the present prospects ahead, apricots will pay exceedingly well this year.

In Alameda County:

Hayward Review

Buyers have been in the field all week contracting for the best of the apricot crops around Hayward and Niles. One buyer closed up for 1000 tons on Wednesday at the rate of $100 per ton.

This is the best price the growers have been offered for the past ten years. This high price is caused by the shortage in crop caused by the long and continuous rains when the fruit was in blossom. There are almost complete failures in some of the older orchards in Castro Valley and around Mt. Eden.

In San Joaquin County:

Lodi Sentinel

Highest prices in history have been named for California's 1919 apricot crop. The California Prune and Apricot Growers' Association, controlling practically the entire output of the state, has set its opening price on a 26 cents per pound basis. Not only is this a record price, but it is almost double that named for the 1918 crop, and about triple the price in past seasons.

Growers with even a small orchard are assured of a neat little fortune this season, for they will be paid on a basis of 12 cents a pound instead of eight cents, as specified in the association's contracts.

Never have the markets of the United States and Europe been as bare of both prunes and apricots as at the present time. Practically all of the 1918 crop has been sold, which leaves a clean market for the coming crops.

Packers have been scouring the country since the first of the year endeavoring to sign up apricot crops. There is no denying the fact that they have offered very attractive prices, and needless to say many contracts were made by the independents. But the members of the association, although they will have to wait for a longer period for their money will, in the long run, average a much higher return than those that signed with the packers.

Another Ventura County view:

Ventura Post

With a bumper crop in prospect and prices today at high water mark in the history of the apricot industry, Ventura County apricot growers have a bright season before them, as the result of the combination of good crops and high prices.

Buyers are in the field and have been for some weeks. They are contracting for the output just as fast as they can induce growers to sign. The activity started a week or two ago with opening quotations at 15 cents per pound for the dried product. The figures have been going up steadily, until today it is reported that 22½ cents per pound is being offered.

Some growers anticipate the price going to 25 cents and are holding off in anticipation of getting that figure.

In San Bernardino County:

Redlands Facts

Apricots have been further advanced and materially so—in fact two cents and more a pound—in selling values above even the high prices quoted last week. Prices being paid in the country are going up even more rapidly. Purchases of dried apricots from the growers in the Santa Clara Valley are reported this week at between 25 cents and 27½ cents a pound.

California Prune and Apricot Growers, Inc.

Opening prices on 1919 dried apricots to the trade. These prices, with differentials, are as follows:

Sunsweet Quality: Choice, 25 cents; extra choice, 26; fancy, 27; extra fancy, 29; fancy Moorparks, 29; extra fancy Moorparks, 32.

Growers Brand Quality: Choice, 24½ cents; extra choice, 25½; fancy, 26½.

First Quality: Standards, 19 cents; slabs, 21.

Other grades, such as whole fruit and off-quality deliveries, will have to be taken care of on the basis of sale largely on sample.

The above prices will make it possible for us to make delivery payments of 12 cents or more per pound rather than the eight cents specified in our contracts. Realizing that the above prices speak for themselves, will forego more elaborate comment.

* * *

Of course the buyers are not highly elated over the situation. Here is a dispatch we pick up under a date line

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

California will produce some plums and other things this year. The present promise is for a wonderful crop of almost every tree product. Whether every branch will show the return indicated on cover page of this issue we question, but it is a bit of an indication of the wealth of California fruits under California conditions. A warning may be in order—although not needed by most California fruit growers for they understand the necessity for thinning. Don't let the trees overbear and reduce the quality of the fruit which this year will bring almost fabulous prices, as is indicated by some of the clippings on third page of this issue.

ALL HONOR

More than ever this year the observation of Memorial Day is general. There is more of sadness than for many years. More than 50,000 new-made graves in France have left vacant chairs by that many American firesides, and the Holy Day, sacred to the heroes of the Civil War and later to those of the Spanish-American War, is now rededicated to all our noble dead.

There is less of sports and less of feasting and the day is observed for what is is, a day of sacred observance. It is said not an American boy's grave in France but will have its flower of remembrance. Surely not one in America. The graves on this side are just as sacred, and the mother or wife whose loved one died serving the home land in the home land may have as holy joy in loving remembrance or paying tribute as may those whose boys went down in the midst of battle.

All honor to the loyal where-e'r they lie.

AGRICULTURE ADVANCES

Two bills of utmost interest to the agricultural industry of California have been signed by Governor Stephens. They are:

The farm adviser bill, carrying an appropriation of nearly $170,000 for continuance of the work which agriculturists have found of so much benefit and of so much promise that they are not willing to give it up.

The state department of agriculture bill, consolidating various state agricultural activities under one director of agriculture. The statement is current that the present state commissioner of horticulture, Geo. H. Hecke, will be named director of the new department.

SLACKERS

The ease with which some contractors find "deterioration" in products for which they have contracted—and later the market has shown a downward tendency—is proverbial. With the market advancing the contractor, who has agreed to pay a cent or more per pound less than the present market commands, is entirely honest in carrying out—and insisting on the producers being honest in carrying out—the terms of the contract. With declining markets the atmosphere changes. Delay after delay is often made until finally the market goes entirely to pieces, then the quality of the farmer's product is discovered to be such that it cannot be accepted at any price, or only at a ruinously low price. This has been so characteristic that it has shaped the policy of one of our largest cooperative marketing associations which changed from selling its fruits f. o. b. Eastern points to selling at whatever price might prevail when the fruit was delivered. This gives the grower an opportunity to take advantake of the rise in market; likewise gives the buyer the advantage when there is a decline, and this is always fair.

About the only decline in farm products during the last few months has been in beans, and the bean buyers have shown characteristics which will probably induce many bean growers to seek other purchasers another year.

SAVE THE WASTES

Even the wastes of our orchards and vineyards will be saved this year of wonderful fruit and fruit product prices. Vineyard products do not appear at this moment to be as well cared for as do the others, but another week we will have from the pen of Professor Cruess discussion of that topic. While he recognizes that as yet there is no adequate method of handling vineyard products they may be developed into a wealth maker. Another week the wastes of the citrus orchard will be discussed by Professor E. M. Chace of the bureau of chemistry of the department of agriculture. These waste products have been turned into very valuable marmalades and other table delicacies which have made employment for thousands, and from present indications in a way which will mean much of profit to the owners of the plants who are also the owners of the orchards which have produced the fruits. The matter of the salvage of prunes and other dried fruits which may be caught by bad weather is also under consideration by deciduous orchardists. It is fortunate that these times of prices which are satisfactory to the producer induce saving of every piece of fruit, for it will create an equipment which will be even more valuable in years when prices are not so high.

?

Congress is in session, and the whole country, especially the rural portion of it, has a look somewhat like unto a question mark. What will congress do? There are questions of world import to be settled. Will our congress rise to the occasion? But more particularly we are concerned with what will be done in such domestic matters as agricultural extension and operations affecting all kinds of agricultural activities.

The grange and other organizations of farmers are watching after farmers' interests, but even then the question mark still stands, for what are the interests of the producer which may at the same time be to the interest of the consumer? There should be no antagonism, but there must be something different from the campaign cry of "Produce More; the World is Starving," without any consideration for the farmers' recompense. There are some of the products of the farm which have gone beyond the wildest dreams as to prices; there are others which have caused the farmers to go broke. There should be a regulating or stabilizing influence somewhere which will enable the farmer to produce and continue to produce and still live.

California bean growers have not lived during the past year—at least not from the results of their labors in growing beans. Other crops may be mentioned which have not sold at living prices. Whether the bureau of markets or other federal organization will aid in this stabilization or may be empowered to aid through legislation is one of the long questions we are asking. The bureau of markets is at present embarrassed by the fact that its life ends in July unless an appropriation is made—and quickly.

Hence we are looking to congress to do something.

BETTER VETERINARIANS

We have received an announcement of the annual joint meeting of the California State Veterinary Association and the Southern Auxiliary, to be held at Fresno, June 2-3. The members of the two associations are doing much to place their profession on a high plane and through their annual meetings are accomplishing much. The day of the old-time "hoss doctor" is past. No longer is the live stock owner satisfied by a practitioner whose sole reliance is the physic ball. The importance of the live stock industry is such that those engaged in it have a right to demand the services of well trained, high class men. In this connection we are reminded that there is not a veterinary college in operation in California. The University of California maintains a department of veterinary science as part of the equipment of the college of agriculture but as the department exists it is quite impossible to offer a course of sufficient scope to award a degree comparable to degrees offered by any first class institution.

The modern veterinarian should have in addition to his technical training a wide knowledge of the live stock industry and be in close sympathy with the problems of the producers. The university should be in a position to offer such training to California boys who desire to practice veterinary science, and it is to be hoped that during the next few years such a school will be established.

REDUCE THE NUMBER

The nurserymen are talking over many things at Riverside this week. One of the most important of these things has to do with standardization of the product of these nurseries, and one feature of that standardization has to do with the reduction of the number of "new" fruits which are almost daily introduced. Reference was made to one peach which answers to some half dozen names in a half dozen different catalogues.

Florida orange growers have been planting scores of varieties of oranges. California has centered on two and has succeeded wonderfully. So Florida called a conference of growers and shippers, and it has recommended that planting shall cease on all but some five or six varieties.

But as to peaches and many other fruits equal judgment is not shown in this state. The nurserymen realize the value of introduction to growers of varieties of real merit, especially when the season is extended.

But to determine as to this merit there should be some definite and concerted action. The nurserymen in convention, representing some 50 or 60 per cent of the stock produced in the state appointed a committee consisting of Messrs. Gandier, Roeding, Shamel, Coates and Coolidge, to report as to feasibility of plan for standardization and reduction of worthless fruits.

Some nursery catalogues are prone to use superlatives with every article described regardless of worth. The reputable dealers propose to discourage this tendency. Strength to their arm

ORGANIZATIONS ORGANIZE

It's a hard proposition to get full cooperation on the part of one cooperative organization with another cooperative organization. It has been slow work to educate individuals up to the point of subduing "independence," "right to control my own," "ability to run my own business," and truly cooperating with their neighbors to the end that industry has grown and all have benefited. That education has been wonderfully advanced during the past few years and many most successful—permanently sucessful organizations—perfected.

Now, can these be brought together in one great cooperative effort?

The editor of the Cultivator recalls one such effort in which he had part in 1915, the Exposition year. We asked: "Can not the cooperators of this one state amalgamate and bring into one organization all the others for mutual benefit?" Men gathered from all parts of the state at the exposition and later at the State Fruit Growers' Convention at Palo Alto, and discussed it. But either the idea was too big or not big enough. The movement failed.

Now comes a bigger idea—a fusing of all agricultural, horticultural and live stock bodies into one federation which shall represent the farmer nationally or even internationally.

There are, in fact, some two or three of these federation ideas advanced, but one is being pressed with great vigor and has sent to the Coast organizers for a series of conferences.

The meetings already arranged are to be followed by similar conventions in the Middle West and other parts of the nation, which will be held later in the year, after the harvest season is ended. Starting at Lexington, Kentucky, May 31, the conference will include Salt Lake City, June 3 and 4; Modesto, June 6; San Jose, June 7; Spokane, Washington, June 11, 12 and 13; Bozeman, Montana, June 14; Bismarck, North Dakota, June 16; Fargo, North Dakota, June 17; and Mitchell, South Dakota, June 18.

Speakers will include United States Senator Thomas P. Gore, Gifford Pinchot, Dr. W. J. Spillman, editor of a farm journal of Pennsylvania; J. A. McSparran, master of the Pennsylvania State Grange; Charles S. Barrett, national president of the Farmers' Union; Milo D. Campbell, president of the National Federation of Milk Producers, and Morris McAuliff, president of the Farmers' Union of Kansas.

The Six Great Conventions at Riverside

Editorial Correspondence

MORE delightful setting, more delightful company, more satisfactory program and arrangement of detail was never given a convention.

The setting is Mission Inn town—in fact just Mission Inn, for all the sessions, three at a time, are housed in the quaint old Inn and it is impossible to get away from its charm.

One convention, that of the nurserymen, is meeting in the Art Gallery; another, the Interstate Plant Quarantine conference, meets in the Cloister, or the little chapel of the Inn, and the big sinky leather chairs induce a sleepy nod when a speaker gets prosy—hence pep is necessary and in fact decidedly on tap nearly all the time. Note, "nearly," for honest to goodness it does beat thunder how some folks—addressers of conventions and things—can make two syllables out of the—"the-ah," with continued clinging to the ah—and can say "um, um, u-m" two or three times between words while we sit here in full realization of the fact that our bill for five or six dollars per day at the Mission Inn is going right on while we are waiting for the next word!!

But pardon,—I was talking about the three sessions. The other was in the 'Dobe in the center of the court. This was of the vegetable folks who are talking about potato seed certification and will talk tomorrow about other vegetable seeds, standardization and other things.

The convention, the one which begins with a capital "The", "The California State Fruit Growers and Farmers' Convention", does not begin till Wednesday, and this is written only on Monday evening, so the real story next week.

Another conference in session is that of the Horticultural Commissioners of California in conjunction with the nurserymen. The keynote of this session is "Closer Cooperation" between nurserymen and commissioners. The spirit indicates it's coming.

There are big men here. A list of a few of them was given in last week's Cultivator. It certainly is an opportunity for California growers that could they but "sense" it would bring many more of them here.

But it isn't possible to run back and forth from meeting to meeting in the effort to "cover" three sessions and to write of the serious side of the convention while the guitar and mandolin play and the senorita with castanets sings La Paloma, in which even the mocker joins, all unite to make day dreaming of foreign lands and idle chat with friends more attractive than workaday writing.

* * *

THE TREND OF AGRICULTURAL PRICES

Address by Dean Thomas Forsyth Hunt at California State Convention of Fruit Growers and Farmers at Riverside

IT IS now pretty thoroughly understood that the general increase in prices is related to the amount of currency and other instruments of credit in circulation. The dearness or cheapness of any particular commodity is not determined, therefore, by its price in dollars and cents, but by the amount of other commodities it will purchase.

Various indexes are used to determine price levels. I have chosen Bradstreets index of the wholesale price of thirty-six commodities, because the prices of farm products with which I shall deal are wholesale prices. This index was 210 in 1918, as compared with 100 during the five years preceding the war. Thus, during 1918, no commodity was high unless it was twice the price of pre-war times. The highest price level was 215, reached in July, 1918. By March 1, 1919, it had fallen to 193. In general it has held at about that level since then. On May 1, 1919, live stock, however, had reached the highest level on record. Usually, new price levels occur a few months after a new bond issue, because new credits are established. It will be interesting to observe whether the new Victory Loan operates in the usual manner.

The general trend of prices indicates that during 1917 the price of crops and live stock rose faster than did farm wages and articles farmers buy. In 1918, however, farm wages and articles farmers buy rose much more, relatively, than did the price of farm products. While the money value of farm products was higher in 1918 than in 1917, relatively prices were less favorable to the farmer in 1918 than in 1917. If the five years prior to the war, 1909 to 1913, be taken as 100, then the value of farm land in 1918 was 167, farm wages 172, the average price of crops and live stock 209 and the articles which farmers buy 202.

Contrary to the opinion of many sincere people, in general the wholesale price of farm products during 1918 has not been high. The prices have been strictly related to the amount of currency and other instruments of credit and to the price of articles which farmers must buy in the conduct of their business. It is true that farm wages have not risen quite as rapidly as the price of farm products. This, however, is of less importance than would at first seem, since three-fourths of the labor on American farms is performed either by the farmer himself or some member of his family. While there has been, in the aggregate, enormous increase in the capitalization of American farms during the war, expressed in dollars, yet if these farms were converted into dollars, the dollars would not buy as many commodities as could have been bought with the proceeds of these same farms prior to the war.

Naturally, some farm products rose more rapidly than others during the war and some have receded much faster since the signing of the armistice. On March 1, 1919, wheat, corn, beans, hogs, sheep and wool were somewhat above the general price level. Wool, however, is the only one which was strikingly above it. Barley, oats, hay, potatoes, butter, milch cows and horses were well below the general level. Horses were less than one-half the relative value of other commodities. Horses are both actually and relatively cheaper than they have been in years, notwithstanding the prices of farm horses in France and England have been from two to three times the pre-war price. On March 1, 1919, the average price of barley was one half that of eleven months ago. Beef cattle, cotton and eggs were about normal when compared with the general level of prices.

Authorities generally have hesitated about making any predictions based upon previous wars, since this World War transcended all other wars in the number of countries and the variety of interests involved. The magnitude of the cost in money and life having been beyond all previous knowledge, the after effects may be beyond all previous experience. It is of some moment, nevertheless, to observe that the length of the Civil War and that of the recent World War were practically the same, and that the inflation of commodity prices during the war was identical when compared with the five years preceding each war. If this be a coincidence, it is a most extraordinary one. While one must not be hasty in drawing conclusions, it will not harm us to know that commodities lost two-thirds of their war prices within six years of the close of the Civil War. Return to their pre-war levels took about thirteen years.

As stated at the beginning, the new price level of 1918 is now generally recognized to be due to the amount of currency and other instruments of credit in circulation. Is this a new permanent price level such as has occured in history before, or is the price level going to fall in the course of a few years to the 1913 price level or even to that of 1896? Professor Plehn of the Economics Department of the University of California has pointed out to me that, at the close of the Civil War, when the United States was on a currency basis, the European countries were on a gold basis, to which we returned later. Now the European countries are on a currency basis. Perhaps the United States is nearer a gold basis today than any other country. If so, what effect is this going to have on the rate at which its currency will be retired? Irving Fisher, Professor of Economics, Yale University, is of the opinion that the general level of prices is not going to fall much, if at all. He believes we are on a permanently higher price level, that is, for many years. Indeed, he indicates there are factors favorable to an even higher price level.

On the other hand, referring to the panic of 1873, Horace White, a writer of the times, said, "The appearance of prosperity immediately preceding the panic is so deceitful, the activity of trade and the upward movement of prices so exhilarating, that the tornado always finds us with every inch of canvas spread, all the ports open and the crew fast asleep." Which is the correct view? It is possible that both may be correct.

These have been prosperous times for the farmers who had contracted debts prior to 1914. In 1918 they could pay their pre-war debts with one-half the commodities that were required during the five years preceding the war. To that extent, the farmers have been making money. It is one of the cases where it is fortunate to be in debt. If a farmer contracts a debt now to be paid fifteen years hence, and in the meantime the prices of his commodities return to pre-war basis, it will require twice the commodities to liquidate it.

However, so far as current expenses are concerned, the farmer is not so much interested in the general level of prices as he is whether the prices of what he has to sell rise or fall faster than the commodities he must buy. If one really knew what was going to happen to the price of specific articles, it would be comparatively easy to become many times a millionaire. All it would be necessary to do would be to sell long or short, as the circumstances required. I sometimes watch the billiard players, but I do not understand the game. I can see the forces that move the balls, but I can never tell which direction they will take. Perhaps some day I shall learn to play billiards. Not until then shall I prophecy.

Notwithstanding, it may be pertinent to recall some of the well known features of agricultural progress during the past half century. Between 1860 and 1910, the population of continental United States increased a little less, and the number of farms increased a little more than three times. Which will increase more rapidly in the next half century? Will the number of farms be tripled during that period? The land in farms now occupies about one-half of the land area of the United States. During the decade ended 1880, the improved land in farms increased slightly over fifty per cent. How much will this area increase in the decade ending 1930? How rapidly will we increase our importation of food? Whence shall we import it?

The labor cost of producing farm products has in many cases been greatly reduced through the introduction of labor saving machinery. Some genius for statistics has determined to his satisfaction that between 1855 and 1894, the time of human labor required to produce a bushel of Indian corn declined from four hours and thirty-four minutes to forty-one minutes. In like manner, it was found that the required human labor for a bushel of wheat declined from three hours and three minutes to ten minutes. While these figures are open to question, a great reduction of human labor, when applied to the production of food, is well understood; better, perhaps, than the consequences. There were three direct consequences. The price of products declined. Farm wages increased. It required a larger farm to produce a given gross income. The rate of farm wages declined between 1866 and 1879 when stated in currency, but stated in gold, there has been a general rise in wages ever since the close of the Civil War. Thus, using the gold standard, the average monthly wage without board was $15.50 in 1866 and $25.46 in 1909. In 1918, it was $47.07. The readjustment of the size of fields to labor saving machinery was made possible through the development of the United States west of the Mississippi River during the last three decades of the last century.

Does anyone foresee a similar reduction in the labor required to produce agricultural products? The human race cannot in the long run consume more than it produces,—a fact which we are just now in danger of forgetting. Our material welfare consists in efficient production, which means a large production per unit of labor; in equitable division among all the individuals

(Continued on Page 751.)

Agricultural News Notes of the Pacific Coast

Northern California

Butte County orchardists are appealing for peach thinners.

Early cherry shipments have met strong demand in New York.

Horticultural Commissioner Mills of Butte is conducting ground squirrel campaign.

The Hayward Review, Alameda County, chronicles contracts for 1000 tons of apricots at $100 per ton.

An agricultural expert from Java, Dutch East Indies, is investigating rice conditions in the Sacramento Valley.

Work is being rushed on the new Colusa rice mill in order to have it in readiness to handle this year's crop.

Berries are bringing $3.25 to $4.00 per ten pound box at Placerville, as against an average of $1.50 in former years.

A New York manufacturer is contemplating making a planting of 90 acres of ramie near Woodland, Yolo County.

Sonoma County cattlemen met recently at Santa Rosa and discussed affiliation with the State Cattlemen's Association.

Farm Adviser Jones of Eldorado County reports shipping from that section of some remarkably fine Duroc-Jersey hogs.

A petition for the organization of the Honcut irrigation district in Butte County has been filed. It will cover about 37,000 acres.

A petition to form an irrigation district to be known as Cordua irrigation district has been filed with the Yuba County board of supervisors.

The planting of rice was finished much earlier this year than formerly. The acreage will be great and it is thought the harvest will be earlier by three weeks.

Horticultural Commissioner Norton of Nevada County says there is a very considerable drop of young fruit in pear orchards. He estimates the crop at only about half normal.

Farm bureau delegates from Yuba, Sutter, Placer, Eldorado, Sacramento, Yolo, Solano, Napa, Merced and Madera Counties have decided on a wage scale for general and orchard work.

The Durham Cooperative Stock Breeders Association, Butte County, has elected H. F. Bahmeier, George E. Pearl, Frank M. Hall, C. F. Cheaney and Frank E. Baxter, who will formulate rules and regulations in the operation of irrigation system for the settlers and who later on will act as temporary directors for a mutual water company, which will be formed in taking over the water system from the state.

The State Fair Association announces the folowing judges at the coming fair: Professor E. A. Trobridge, Missouri College of Agriculture, Columbia University, light horses and horse show; Hugh G. Van Pelt, editor of Kimball's Dairy Farmer, Waterloo, Iowa, dairy cattle; Guy Putnam, Tecumseh, Nebraska, Duroc Jersey; Professor J. I. Thompson, University Farm, Davis, will assist in the judging. R. M. Miler of Texas Agricultural College, formerly of the University Farm, Davis, judge of sheep. W. J. Head, San Francisco; Robert V. Moore, Oakland, and J. C. Hinds, Alameda, poultry and pet stock.,

Central California

A packing house at Visalia, Tulare County, made a shipment of peaches on May 17.

Tulare County expects to ship out about 1000 cars of Valencias. Half of the crop is now picked.

Santa Clara County reports offers of as high as 22 cents for best grades of dried prunes; 27 cents for dried apricots.

Over 2000 acres in Stanislaus County are to be planted to crops for production of seed; 900 acres will be devoted to Sudan grass seed.

Machinery costing $12,000 for bleaching nuts is being installed in the Lodi packing house of the California Almond Growers' Exchange.

Grasshoppers have made their appearance in the Terra Bella district of Tulare County and are eating young growth on olive and orange trees.

Indicative of what is expected to happen when the cantalaupe crop of the district starts going to market it may be noted that the Turlock Merchants and Growers, Inc., is advertising for 20 truckers, five swampers, four bookkeepers, 16 inspectors, 12 car loaders, five checkers, and some extra stenographers. It is expected that the business will begin about July 25.

On the monthly pay day, May 15, the Tulare creameries distributed $190,000 to the dairymen of the section, with 63 cents per pound as the price of butter fat. On the same day the Cooperative Poultry Association paid out $20,000 to its members for poultry and eggs delivered. Members of the Liberty Loan committee stated that the amount paid equalled 62 per cent of the city's subscription of $306,000 to the Victory Loan.

Walter F. Drabnick, Harry Locey and Richard Higgins have been named a joint committee of the Visalia Board of Trade and the Visalia Commercial Club to have charge of the organization work for the proposed Tulare County citrus fair, to be held here early in December. Live stock will be included in the prize lists this year, this feature of the show being placed in the hands of John P. Walker, chairman of the Tulare County Duroc-Jersey Association.

With prices off for top, nine carloads of hogs were sold at the Tulare Farm Center hog auction April 13, the prices ranging from $17.90 to $16.20, 860 animals being disposed of. The feature of the sale was the close of the boys' pig contest inaugurated by the bureau, 11 animals being entered which sold for $18.05. The pigs averaged 60 pounds at the beginning of the contest and at the end of 115 days the average was 250 pounds. The prize pig cost its boy owner $31, and was sold for $55, a net profit of $24.

All egg price records for April were broken at Tulare on May 15 when payments were made to members of the Cooperative Poultry Association at the rate of 45 cents for selects, 41 for No. 1 and 38 for No. 2 eggs seven cents over the prices for the same month last year. The association also announced the adoption of a system of collecting eggs by motor truck at night from the ranches, during the hot weather, to insure that all eggs be marketed promptly and be in the best possible condition when shipped.

Southern California

The first carload of tomatoes out of Brawley was shipped May 14.

Heavy tomato shipments are now going forward from Brawley, Imperial County.

Ranchers below the line in Mexico are appealing to have the duty on cotton lowered.

Date growers of Coachella Valley are contemplating building a $50,000 packing house.

Orange growers at La Verne, Los Angeles County, contemplate the early erection of a citrus packing house.

The industrial commission has fixed a minimum of 28 cents for piece work by experienced workers in canneries.

The big stock of lima beans stored in Ventura County has been very materially reduced during the last two weeks.

With only 28 per cent of the Lima beans left in the pool the price has been raised by the directors to eight cents per pound.

Apricot growers are pleased with the high prices promised for fruit this year; even pits will bring $40 to $50 per ton, it is claimed.

Hemet apricot growers are pleased with the prices set by the Prune and Apricot Growers' Association. Prices on apricots range from 19 to 29 cents.

Riverside Fair Association promises great exhibit at the next fair which will be held in October. Honey producers of the county promise fine exhibit.

Moreno, Riverside County, farm bureau is organizing to cooperate in the marketing of the big crops of barley and wheat produced there this season.

Dr. Fawcett of the citrus experiment station has been giving demonstrations as to treatment of gum disease before farm bureaus of Redlands and Highlands.

County Development Agent Nelson of Imperial County announces that the acreage planted to alfalfa in the valley this year has jumped to 130,000 from 100,000 last year.

A Japanese shipper of cantaloupes makes charge that some of his packing house employes have been "tempted" "to do that which they should not do" by inspectors of cantaloupe packing houses.

The great cotton conference to be held in New Orleans in October is arousing interest among California planters. It is expected that 4000 delegates from all parts of the world will attend this conference.

Market Commissioner Weinstock charges that the fish industry has resumed profiteering and that 32 per cent of the catch is diverted to making of fertilizer to force up the prices for human consumption.

The railroads are protesting the right of freight trucks to operate over the highways of Riverside County in carrying their freight between San Jacinto and Los Angeles. The supervisors will take up the question at an early date.

Dr. H. J. Webber, formerly head of the Riverside Citrus Experiment Station, has been promoted to the position of director of the experiment stations of the University of California. He will be suceeded at the citrus experiment station by Dr. J. T. Barrett, acting director.

The Coast and General

Chicago eggs are selling around 45 cents.

Cattle ranges in all parts of Arizona are improving.

Walla Walla, Washington, plantings of fruit trees are greater this season than for years.

The second annual Navajo County fair will be held at Snowflake, Arizona, October 7, 8 and 9.

Canners at Centralia, Washington, are contracting strawberries, 12 cents; loganberries, 8 cents per pound.

Contracts have been made for new stables at the Arizona state fair grounds and for a new entrance to the grounds.

Snow has practically disappeared from the White Mountain Range, Arizona, and streams are gradually decreasing in their flow.

A waste products plant at Wenatchee will use 400 cars of apples in the making of fruit bricks which are commanding increasing market.

A forest fire covering 200 acres in the pine belt north of Payson, Arizona, has been reported by the supervisor of the Tonto forest reserve.

The bureau of crop estimates has fixed upon 32,719,000 bushels as the production of peaches for the coming year. The crop will be much larger than that of last year.

The concrete road from Phoenix to Tempe, Arizona, is practically completed and will be entirely open to travel within a short time. This is a part of the state highway and will be further improved by a concrete road from Tempe to Mesa.

Nine foremen of sheep gangs in the Hillside, Arizona, district, have been arrested on the complaint of the cattle growers, that they did not move their sheep rapidly enough along the trail designated as the Sheep Trail for driving sheep from the southern part of the state to the northern ranges.

Attorney General Wiley E. Jones, of Arizona has recently ruled that planting Johnson grass in Arizona is liable to involve one in some legal difficulties as the law is very stringent in the matter. The ruling was occasioned by the desire on the part of a dry farmer in the San Simon Valley to increase his fields as he had found it a splendid hog feed.

May 7 was Registered Pig Day of the Girls' and Boys' Pig Clubs of Maricopa County, Arizona. Through E. B. Oxley, county leader for the County Boys' and Girls' Club work, arrangements were made with the banks whereby those interested could borrow money for the purchase of registered pigs, and a considerable number availed themselves of the opportunity. One boy, a member of a pig club, has sold $130 worth of pigs this year.

According to M. E. Musgrave, predatory animal inspector for the biological survey for Arizona, a new animal pest has developed from the Mexican situation. Quite a number of Mexican families living along the border have deserted their homes and left behind their dogs. These dogs in considerable number have turned wild and are preying on calves on the ranges near the border. Some have mingled with the wolves and have acquired many of their characteristics.

A PROSPEROUS YEAR

(Continued from Page 745.)

are asking too high an opening price for their product, declares Hal C. Williams, one of the leading Chicago brokers in California canned goods, who says prices for fresh fruits are being held at such a level that the average person will be unable to buy. Williams is touring the state investigating cannery conditions. He says, in his judgment, the total revenues to the growers would be greater if some effort were made to stabilize the opening prices and maintain them at a level which would be attractive to everyone.

* * *

The producers of prunes are likewise having that satisfied feeling. But prune eaters of the Santa Clara Valley are already hungry, as note the following dispatch in the

Fresno Republican

San Jose, in the heart of the prune growing section of the Santa Clara Valley, practically is pruneless tonight as far as the resident consumer is concerned.

According to growers and packers, prunes which sold last year for 6½ cents a pound today sold for 12½ and 13 cents, while the two highest grades went up to 20 and 22 cents.

They reported a corresponding increase in practically all grades of fruits. Green apricots which last year sold for $65 a ton went from $100 to $105 a ton. Dried apricots sold for 27 cents a pound, almost double last year's quotations, and were in big demand.

The increase was attributed to the heavy European demand.

A scarcity of these fruits here, particularly in stores and restaurants, was reported, with prunes leading in scarcity.

* * *

Manager Coykendall, Prune and Apricot Growers, Inc.

The California Prune and Apricot Growers will enter the prune districts of Oregon next year, according to H. G. Coykendall, general manager.

On May 1 the California Prune and Apricot Growers formally opened the season by booking orders for future deliveries. According to a statement by Mr. Coykendall the association on the first day booked orders covering its entire product for future deliveries at a price to be named later by the association, and naming its own sizes. These orders came from Belgium, Sweden, Norway, Russia, China, Africa, South America and a number of other foreign countries. In addition to booking orders to cover its stock, the association turned down orders aggregating between 40,000,000 and 50,000,000 pounds. In 1917 the association shipped 15 carloads of prunes into Canada, and this season has orders for 12,000,000 pounds for that country booked at the association's opening price.

Prune growers up North are likewise elated, although crop will not be up to normal. We note under date of May 16 the following

Dispatch

Italian prunes opened at 13½ cents and now local packers are offering 15 cents for 30-35s. The 1918 season opened at 11⅞ cents for 30-35 sizes, which made 50-55s worth 9⅞ cents. The latter size this year are worth 14 cents. Growers of well cared for orchards should receive an average of $260 to $280 per ton for their dried fruit. Practically all the crop of the Willamette Valley, Washington, that is not pooled in the cooperative associations is now contracted for. There is a feeling that the market is a little top-heavy and that there will be a downward trend in prices.

The Willamette Valley district which has 12,000 to 13,000 acres in bearing prunes, produced some 34,000,000 pounds of dried prunes last year. The crop this year will be somewhat lighter. It is too early to make a very accurate estimate of probable tonnage since the blossoms are just falling in many of the orchards but it is known that the crop will be shorter than last year even though many young orchards are coming in. The thrips have put some orchards out of business for the year. The last two years have been very dry and warm and this condition coupled with the fact that the crop of 1918 was a very heavy one has left the fruit buds in many of the older orchards in a condition too weak to function properly.

Peaches are promising a fairly good crop while pears are lighter than last year.

The loganberries have not yet blossomed but are looking fine.

* * *

Even dried apples and water will be impossible for the small pocketbook. From that dried apple center, Rochester, New York, comes the following comment on the dried apple situation, given in

Pacific Coast Packer

About 2600 boxes of prime white stock was sold this week at 18¼ cents per pound, f. o. b. here, but with that exception there has been little doing in the evaporated apple market here for the last week. Holdings are light on all grades as told previously and business from now on will be restricted. Prices are fully maintained. The principal quotations f. o. b. here are: Prime, 18 to 18½ cents per pound; choice, 19½ to 20 cents; fancy, sold out, all basis, boxed; chops, 7¼ to 7½ cents per pound; choice, 8 to 8½ cents; fancy, 9 to 9½ cents, all in barrels; waste, scarce, prime to fancy, 4 to 4½ cents per pound, bags.

More interest now centers in the prospects of the new 1919 output than in the old crop closely cleaned up. There is a strong impression that export demand will be the strongest factor it has ever been when the season opens up next fall. Foreign markets have been stripped by the war and there are no domestic reserves. Coupled with this is the policy of business men to reach out for their share of foreign trade in the adjustment of the market which is at hand, and it is likely that firms which never before have been interested in export trade will at least, take a flyer at it.

This is reflected in the business that is now being done in future for fall deliveries. Many cars have already been sold and the price for prime white stock, boxed, which began a fortnight ago at 15 cents per pound, has now worked higher until the last sales have been made as high as 17 cents a pound. This is the highest price of its kind on record for this territory. The sharp advance in values is shown by the contrast with a year ago, when the market on futures, prime stock, opened at around 12 cents to a shade higher.

* * *

Pears are also looking good.

Sacramento Bee

Pears are bringing as high as $75 a ton on contract. This is an exceptionally high price for canning pears. In previous years $50 a ton has been considered a good price for this fruit. The pear crop this year is reported short. In Eldorado County the crop is estimated at 75 per cent, but indications are that the percentage will be lower than this.

* * *

Meantime, the producer is digging deep for cherries and a few other fresh delicacies. Note these:

Fruit Stand Signs

"Fine Black Figs, 15 cents Each;" "Cherries, 35 Cents Pound;" "Home Grown Avocados, $1.50 Each;" "Cantaloupes, (much larger than English walnuts), 25 Cents Each;" "Apricots (larger than green peas but same color), 15 cents;" "New Potatoes, 10 Cents One-half Pound;" "String Beans, 15 cents Pound;" "Fancy Cherries, 50 Cents Pound;" "Cucumbers, 10 Cents Each;" and while Roquefort cheese doesn't grow on trees, as an indication of the price we are willing to pay in these glorious days, "Roquefort, 17 cents per O-u-n-c-e."

BEEKEEPING ORGANIZATIONS TO ORGANIZE

At a recent annual convention of beekeepers associations a committee was appointed for the purpose of forming an organization of beekeepers associations. The committee reported this resolution:

"Be it resolved: that the secretary of this association be directed to invite representatives of all organizations of beekeepers, teachers of beekeeping and members of the allied trades to meet at Kansas City, Missouri, in January, 1920, for the purpose of formulating and adopting a plan and constitution for a National Association."

Yes, STRONGEST where others are weakest!

At the very point where ordinary ladders are weakest—the place where step is fastened to stile, the

SECURITY KANT-WOBBLE LADDER

is strongest. Has patented cuff-bracket made of 2 oz. of sheet steel, machine-wrapped around stile at each step-end. Makes SECURITY strongest where greatest strain comes, and where ordinary ladders are weakest.

Cuts your picking costs—enables picker to do a better day's work—rounded edges save damage to trees—boosts your profits!

When SECURITY ladders go up in your orchard your picking costs go down. Equip with SECURITY ladders now—see your dealer or write me today for new booklet.

THIS PATENTED CUFF-BRACKET DOES IT!

Apricot Dryers
Save $50 per Ton in Drying Expense By Using The
International Dehydration Machine

Every FRUIT and VEGETABLE GROWER and all CANNERIES should use this approved method without delay. The establishment of an International dehydrator in any community is a mark of progressive distinction. "Fifty-four per cent. (U. S. Government Report) of vegetables and fruit that come to maturity are lost."

If 46 per cent. of the present crop constitutes the prosperity of your community today, what would 54 per cent. IN ADDITION do for the merchant, the banker, the tradesmen and for the producers themselves?—to say nothing of the increased land values—an increase from the present approximately $50 per acre to $250. No industry will add more to the material good and general wealth of the community than a local International Dehydrating company.

Is it not good business to convert all surplus crops into real money? We are prepared to do our part, the market is ready and waiting.

This machine is not a "toy" or a "hot box." It is a real commercial proposition. We completely guarantee the perfectness of our equipment.

SOLD ON PAYMENT TERMS, at the rate of $50 per ton basis.
MACHINES Made in Five Ton Units up to 100 tons per day capacity.

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

Summer Course in Agriculture

By M. E. Bemis

The Arizona college of agriculture is planning something of an innovation in agricultural education. This will consist of a six weeks' course in irrigation agriculture. This was designed primarily as a post graduate course for agricultural students from the high school or college, but may be taken by any adult interested in agriculture.

The purpose is to give an opportunity of gaining practical knowledge of agriculture under irrigation.

The course will begin June 30. Headquarters will be the Mesa agricultural experiment station. Students will visit farms throughout the valley and will also inspect the Roosevelt dam and the water distribution system.

The program illustrates the work which will be given:

June 30-July 4: Irrigation under the Salt River Valley project, history of irrigation in Arizona, development of the Salt River Valley and other irrigation projects, irrigation legislation, engineering features including visits to Roosevelt dam; duty of water, seepage, underground water, necessity of drainage.

July 7-11: Soils of the Salt River Valley, soil types under the projects, composition, per cent and potential fertility, general character of arid soils, character of irrigating and of ground water, influence of irrigation on soil fertility, alkali and the rise of alkali, special problems of arid soil fertility.

July 14-18: Field crops of the Salt River Valley, alfalfa, cotton, cereals, sorghums, legumes and cover crops.

July 21-25: Animal products of the Salt River Valley, relation of the irrigated valley to the range, dairying comparison of feeding systems.

July 28 to August 1: Horticultural crops in the Salt River Valley, fruit and vegetable production; citrus, olives, dates and cantaloupes.

August 4-8: Miscellaneous farm operations under a large irrigation project, markets and marketing, agricultural industries, organization, company developments, colonization, criticism and suggestion.

Study of Plants

By Ernest Braunton

No department of nature can be more interesting or elevating in its study than that of the plant kingdom. But if you are not interested in plants it would not be profitable to pursue. for your mind would be on something else. You must feel that you are going into the work for yourself, to do the investigating yourself, and not rely wholly on others or on books. Get all the help you can but keep in the fore yourself. Unless you assume this attitude, a determination to investigate and understand, you will make but little headway.

Do not attempt too much at first. Your capacity for learning in this new direction will increase with every day, but if you become thoroughly acquainted with one plant the first day you have scored a great triumph. Do not set yourself certain tasks to perform at or within a specified time. You should absorb the knowledge easily, as it comes, and not make hard work of it. It should be approached as a nature study nor as systematic botany. The latter will appear later if you pursue the matter far enough. One thing you should do, however, and that is to keep the work continuous. Do not take it by fits and starts or even one or more days ea h week. You may go afield but once each week, but you may closely observe trees, plants, and flowers every day. Let no day pass unless you have scrutinized some flower so closely that you know its separate parts. If you follow these lines you are on the road to success at no distant date. I wish enough of our readers were interestd so we could each week have a short simple talk on botany for beginners, not the complex study of the subject found in text books.

Evergreen Raspberry

Much interest was aroused by a note in these columns a few weeks ago about an evergreen raspberry, and several have written to learn the name. It has no common name. All berries of this sort belong to the genus Rubus, and this species is Rubus ellipticus, native to the Himalaya Mountains. It is hardy where lemon trees are and is a true evergreen, growing to a dozen or more feet in height. It fruits well and the berries are fine for home use but too soft for shipping so that it will never be grown commercially, but for home use it is yum-yum. When ripe the berries are yellow and of delicious flavor.

The Satin-Leaved Acacia

The handsomest of all acacias is A. podalyriaefolia, so named because the leaves are like those of the podalyria or satin-bush. The acacia leaves and young branches are covered with a satin like growth of minute soft hairs, hence our name of satin-leaved acacia is eminently proper and much easier to speak or remember than its scientific jawbreaker. Its leaves in shape are unlike those of any other species we know, being nearly round a d a silvery gray in color. The flower balls are very large and of a deep golden yellow, the most desirable of all species for cutting for house use. The tree is as hardy as the lemon, slow of growth and will not thrive under the hard conditions that other species will endure. But of all it is the finest when in full bloom.

Garrya Ellyptica

A complaint comes that of five Garrya elliptica plants now in the garden five years, not one has bloomed. Whine not; I have grown one for eight years and it blooms not. Neither does it spin, but my head does when I think of the care lavished upon it. I have visited two nurseries where garryas are grown, one of them a half dozen times, but have never seen one in bloom. We have a native species in the South, said to be less showy when in bloom than the Northern G. elliptica, but I have seen the male plants in bloom up in the Arroyo Seco near Pasadena and they were handsome. Unless one has a wild hillside whereon to plant, the purchase of this native shrub is not advised, for it is not showy at best, bearing no real flowers as we understand the word, but strings of gray papier-mache bracts that are curious rather than beautiful.

Wormwood

How many of our readers know one or more native species of artemesia? For the wormwood of the Bible is one, and several species grow in both Palestine and California. The next time you find a plant of it, taste the juice and you will be readily convinced that its common name is well deserved. Wormwood is many times mentioned in the scriptures but always in connection with something bitter. Idolatry, profanity and other sins are

CITRUS TREES

CAPRI FIGS
Delivery June 15th to July 1st
Do not take chances but order now and order sufficient, for Smyrna Figs are money this year. Price $10.00 per thousand, delivered. Quality Guaranteed.
L. C. Collins, Ceres, Cal.

often compared to it. Moses compared idolators to a "root that beareth gall and wormwood." Solomon said the end of a wicked woman "is bitter as wormwood", and in Amos it states "ye who turn judgment to wormwood". In Los Angeles County we have a half dozen species and one of them is called California or silver sage, but is not either the white sage or black sage, but a very common weedy plant covering many local slopes.

SIX GREAT CONVENTIONS

(Continued from Page 747.)

concerned in its production; and in wise consumption. Efficient production, equitable division and wise consumption constitute a trinity that leads to prosperity. Too much emphasis must not be placed upon any one of them. A great many economic theories break down because one or the other of the three is overlooked.

There have been changes in food habits. A striking illustration is sugar. In 1870, the people of the United States ate less than 33 pounds per person annually. In 1914, they ate more than 89 pounds each. The wholesale price in the first mentioned year was 13½ cents, and the last 4 2-3 cents. During less than half a century the consumption of sugar increased three times. The cost was reduced to one-third; hence the annual wholesale cost was nearly the same in both instances, being $4.42 per person in 1870 and $4.17 in 1914. For 1918, the wholesale price of the sugar consumed per capita had risen to $6.03.

During the same period, there has been a great increase in the consumption of fruits, which are a glorified form of sugar. There are many persons now living who can remember the time when an orange on Thanksgiving or Christmas was in the same category with turkey and plum pudding. Will prohibition bring about changes in our food habits? To what extent will prohibition increase the consumption of cream, sugar and fruit? Will sugar beets displace barley? An acre of sugar beets in California will produce 4000 pounds of table food. An equally good crop of barley will produce 800 pounds of human food. What effect will the change, if it occurs, have upon the density of population, upon the price of land, upon the demand for fruit? Is the fruit grower going to have his innings?

The United States has become a creditor nation. When the United States was a debtor nation, our stocks and bonds were held by people who lived in Europe. What became of the dividends? They were spent in Europe for food, clothing, shelter, education and recreation. These dividends created a demand in Europe for fresh eggs, spring chickens, winter lambs, hothouse grapes and Seville oranges. Vast quantities of these same stocks and bonds are now held in America. What will the owners buy with the proceeds of these coupons when they clip them?

During the war, the United States sent to our allies food, munitions and other commodities for which we accepted their notes to the extent of several billion dollars. Evidently, these notes must be redeemed with interest in commodities. What commodities? Obviously, they must be commodities which our allies can produce. Equally certain, they must be commodities which we desire. Will they be manufactured goods or food? What effect will this have on the relative price of fabricated articles as compared with food and other raw materials? Will this balance of trade which must take place sooner or later occur rapidly enough to affect materially the price of the things the farmer has to sell as compared with those he must buy?

Doubtless, it will sooner or later become apparent that under modern conditions it no longer pays the people who live in cities to engage in war, not even if they win. When that fact becomes thoroughly understood, we will no longer have wars except in those countries where civilized society does not obtain.

Go over bearing fruit trees and rub off all the water sprouts. They take up plant food and energy that should be used in the development of fruit and essential growth.

How to Control the Onion Thrips

The onion thrips is an insect so small that it is almost invisible to the unaided eye, but it is prolific, and the most serious menace to the onion growing industry of this country. It causes an annual loss to this crop alone estimated by specialists of the United States department of agriculture to be at least $2,250,000. Though the insect has a particular liking for onions, it preys upon other garden and truck crops, such as cabbage, cauliflower, cucumbers and melons, and also has a ravenous appetite for greenhouse and many ornamental plants, particularly roses. To aid growers in identifying this insect and preventing the losses for which it is responsible, Farmers' Bulletin 1007, "Control of Onion Thrips," has recently been published by the United States department of agriculture.

The first indication that an onion field has been attacked by thrips, says the bulletin, is shown by the leaves, which become whitened. In advanced attacks the leaves are curled, crinkled and twisted, and finally die down permanently. To control this pest, begin spraying with nicotine sulphate solution as soon as there is any evidence of the insect. If spraying is delayed until hundreds of young thrips are present the crop will be seriously injured. The spray material is made by the following formula: Three-eighths pint of nicotine sulphate (40 per cent), four pounds of dissolved soap and 50 gallons of water. Spraying should be done thoroughly and applied as a fine mist.

It is not advisable to plant other crops, such as early cabbage and cauliflower, upon which the thrips feed, near the onion fields. After onions, cabbage and related crops are harvested, the field should be cleaned up to destroy any breeding places of the insect. They will continue to thrive on any portion of these plants or weeds that might remain in the field. It is a good practice to plow as deeply as possible and harrow the ground after harvest. Much of the injury can be avoided by planting as early as possible and by using quick-acting fertilizers after the onions are well set or the bulbs have begun to form. Onion fields should be watched constantly and the plants should be kept growing thriftily, since once the plants become checked in their growth from any cause the thrips will multiply more rapidly than ever and it will be a hard fight to save the crop.

International Motor Trucks
For Country Road Hauling

OF ALL the motor trucks offered for farmers' use, the **International** should be, and we believe is, the most satisfactory.

This Company knows the country — roads, farms, and all. Farmers know our standards of quality and service. When we offer a motor truck for farmers' use, it is understood that the truck will do the work expected of it at a cost farmers can afford.

The **International Motor Truck** is built for carrying capacity loads on country roads. It gives satisfactory everyday service, the kind that farmers must have. When an emergency comes — a tough piece of road, a steep hill, a rush trip, a bad day — the **International** has the reserve power, speed, and endurance to carry it through.

Mr. L. C. Henry of Utica, Minn., purchased an International Motor Truck to haul his live stock and farm produce to market and to bring return loads from town. He says, "We use the truck for nearly every kind of hauling. It saves more time than any other machine in our farm service." Five of Mr. Henry's neighbors bought International Motor Trucks when they learned, from his experience, what a useful economical farm machine he had.

There are four sizes of **International Motor Trucks** — 1,500, 2,000, 3,000 and 4,000 pounds capacity, with bodies suitable for every kind of hauling. We have a dealer, a branch house, or a service station somewhere near you, where the line can be seen, or we will send full information promptly if you will write us.

Tizit, Fumigation, and Black Scale

For Five Years Tizit Spray has proved to those using it to be a thoroughly successful agent in controlling Black Scale.

We have many testimonials from satisfied users among the most intelligent growers who are ready and anxious to testify for the benefit of other growers, that they believe it is the ONLY SUCCESSFUL AGENT in controlling Black Scale at a cost that is not prohibitive.

The numerous and irregular hatches of Black Scale make it impossible for the fumigator to operate in all groves at "just the right time" to get a good kill, and, as is well known, many of the groves that have been fumigated, carry over a large quantity of Black Scale to propagate the next year. Well informed fumigators are now advocating the use of Tizit Spray to control the Black Scale. On groves sprayed with Tizit they can fumigate for Red or Purple Scale at almost any time during the Season, with the full knowledge that the job will be a good one, as Tizit will supplement their work by destroying the Black Scale that hatches after fumigation. Tizit once applied, is effective until washed off by heavy rains.

Tizit will also free the trees of moss, lichen and fungus, all of which are working serious injury, and we also find that the trees are immune from the ravages of the Red Spider after being sprayed with Tizit.

The resultant effects of Spraying with Tizit, evidenced by healthy, vigorous trees and clean fruit that stays in the trees until picked, should make the use of Tizit Spray a regular annual practice on every grove. Money expended on Tizit Spray pays big dividends.

Accept no substitute for Tizit Spray.

Genuine Tizit is manufactured by

Tizit Spray Mfg. Co.

1344 Willow St. Los Angeles

Also may be ordered through our local agents, or the Fruit Growers' Supply Co., or Mutual Supply Co.

Almond Pollination

The experiment station of the California college of agriculture is issuing Bulletin 306, "Almond Pollination,' by Warren P. Tufts. Almond growers have for a long time been in need of more definite information regarding the culture of the almond. The university is aiding an industry which needs great extension.

The bulletin starts with a bit of history of California plantings of almonds which began in 1853. There have been many failures, and failures caused by lack of pollination have been under discussion since '85, when Mr. Hatch pointed out that Languedocs near seedlings always produced heavier crops than when planted in solid block by themselves. There are several half tone illustrations and charts. The book closes with the following summary:

Summary of Almond Pollination

Satisfactory artificial germination of almond pollen was secured in a 12 per cent cane sugar solution.

Inclement weather conditions undoubtedly injured the viability of the almond pollen produced during the blooming seasons of 1917 and 1918.

There is considerable variation in the amount of pollen produced by the various almond varieties.

Almond varieties may be roughly divided into two classes: early bloomers and late bloomers, when the length of their effective full bloom is considered.

The first blossoms produced by certain almond varities each season may yield a smaller amount of pollen and pollen which is inferior in viability to that produced by flowers on the same tree maturing several days or a week later.

Pollenizing agencies, such as the honey bee, are necessary to the set of a good crop of fruit.

The Harriott variety, which during the season of 1916 proved able to set fruit with its own pollen, the following season proved self-sterile.

All almond varieties thus far tested have proved self-sterile, at least in certain years. All of the 17 varieties tested during the season of 1917 proved self-sterile. This list includes the Big White Flat, California, Drake, Golden State, Harriot, I. X. L., Jordan, King, Klondike, Languedoc, Lewelling, Ne Plus Ultra, Nonpareil, Peerless, Princess, Reams, Texas and a hardshell seedling.

Certain almond varieties are intersterile.

The I. X. L. and Nonpareil varieties proved practically inter-sterile during the two seasons' work.

The Languedoc and Texas are intersterile, as shown by the results of 1917.

The California at present seems to be the one best pollenizer for all varieties thus far tested, which have a coincident period of bloom.

The California may be pollinated by the Nonpareil and Peerless.

The Drake may be pollinated by the California, Languedoc, Nonpareil and Texas; however, the Languedoc is a poor pollen producer.

The Harriott may be pollinated by the Ne Plus Ultra.

The I. X. L. may be pollinated by the Ne Plus Ultra.

The Languedoc may be pollinated by the Drake.

The Ne Plus Ultra may be pollinated by the California, I. X. L., Jordan and Nonpareil.

The Nonpareil may be pollinated by the California, Drake, Jordan, Ne Plus Ultra, Peerless and Texas.

The Reams may be pollinated by the Texas.

The Texas may be pollinated by the Drake and Nonpareil.

One colony of honey bees should be provided for each acre of orchard.

Care should be taken in the arrangement of varieties in the orchard to facilitate cross-pollination and convenience in harvesting.

PRUNE AND APRICOT GROWERS IN ANNUAL MEETING

The annual meeting of the Prune and Apricot Growers, Inc., was held on May 14 and all officers were re-elected except that H. C. Dunlap, who has been a member of the executive committee, has been made secretary-treasurer to succeed J. H. Bone, who goes to another position.

One of the most important matters brought up for consideration was the proposed $200,000 advertising campaign.

EVAPORATORS FOR PRUNE DRYING

The experiment station of the college of agriculture is issuing Circular 213, "Evaporators for Prune Drying." It is by W. V. Cruess and gives plans and details for several types of prune dryers.

OREGON PRUNE GROWERS INVITED TO JOIN

Manager Coykendall of the California Prune and Apricot Growers, Inc., says that the association plans to organize the Oregon prune growers next year.

If you are wondering what vegetables to plant that will stand the hot weather of summer try the following: pole bean, tomato, eggplant, pepper, squash, cantaloupe, watermelon, okra, chard, blackeye cow pea, carrot and sweet potato.

Twin City 12-20

First announcement of the Twin City 12-20 Tractor—new member of an old family—the already famous Twin City Line, the 16-30, 25-45, 40-65 and 60-90.

We made this tractor prove its strength, power and stamina before offering it to you. And farmers may now be proud to own this tractor that carries the Twin City mark.

ONE of the largest and strongest tractor organizations in America is behind this Twin City 12-20 Tractor—assuring the stability of your purchase.

It is designed and built to do your work better than it has ever been done before, so we have provided a tractor with a greater margin of reserve power, greater strength to withstand strain, than any other tractor of equal weight or horsepower rating. At the same time it is remarkably simple in construction and extremely accessible,

It is not made to come within a certain price limit—it is designed to meet and master the work a tractor has to accomplish.

These features tell of its quality: For the first time in tractor history, the powerful four-cylinder, sixteen-valve engine is adapted to the low-speed work of the tractor. This engine is the Bloc type with removable sleeves. The counterbalanced crankshaft is also a feature of this motor. The ignition is Bosch high-tension magneto.

The transmission is the sliding spur-gear type, with two forward speeds, direct drive on both.

Write us today for full details of the Twin City 12-20—these are but a few of its outstanding features. Ask for our booklet, "The Factory Behind the Tractor."

At $1525 *complete* you will find the Twin City 12-20 the most thoroughly dependable and economical tractor for your farm.

McAlister Dispersal Sale Successful

The dispersal of the famous herd of registered Holsteins owned by McAlister & Son, Chino, May 21-22, proved to be a splendid appreciation of the choice cattle this firm has developed in California. While it is a matter of regret that through this sale California and the Holstein breed lose from their ranks a breeding firm whose energy, fair dealing and financial strength have been for years directed in a manner that has contributed notably to the advancement of the best interests of the breed, yet a compensating fact is found in the wide distribution the sale provided for rightly bred cattle among new breeders, most of them dairymen of Southern California.

The big sale started off briskly and moved to the finish without a single hitch, and this in spite of an extraordinary unseasonable heavy rain storm that continued throughout the afternoon of the first day.

Consistent prices ruled throughout the entire sale, the top coming on the first day when R. F. Guerin, Visalia, secured the great cow K. P. Tola at $3950.

Burr Farm, Los Angeles, selected an extra choice lot of females that will strengthen the good breed they are building.

M. Bablyon, Santa Ana, bought a richly bred sire in a son of Prince Gelsche Walker out of the same dam as the $3100 heifer sold in the 1917 Guaranty sale at Sacramento.

C. F. Heil of Santa Ana was the fortunate purchaser of the famous bull It at the modest price of $2000, and the same buyer also secured some choice females.

Other items on individual purchases will be given in a later issue of the Cultivator.

Twelve animals in the sale sold for $1000 to $3950, and the entire herd of 159 head, including a few nonbreeders, several one, two and three teated cows, and a bunch of bull calves, sold for a total of $88,685, an average of $558 per head.

The following is a complete list of the animals sold, with name of animal, date of birth, official record if any, price paid, and name and address of purchaser:

Agee Brothers, Brawley

Forum Gold Leaf 5th, May, 1914, 20 pound two year old, $400.
Mercedes Nachefe Segis, December, 1912, 25 pound cow, $475.
It Sadie Burke, September, 1918, $800.
Forum Gold Leaf Segis, January, 1913, 25 pound cow, $500.

UNIVERSITY JERSEY MAKES STATE RECORD

A new record of butter fat production for a California Jersey has been established at the University Farm at Davis by Interested Jap's Santa making 939.08 pounds of butter fat in a year. Two years ago the California state record for a Jersey was 702 pounds held by Pearl of Venadera owned by Guy H. Miller of Modesto. Last year this record was passed by three cows, Mermaiden's Fern II, owned by the University of California, making 729.55, Fern's Silver Ray owned by Frank Vanderpoel of the Imperial Valley, making 779.54 and Interested Jap's Santa of the university herd making 805 pounds. The state record cow now raises her own record 134.08 pounds. The new record which is Santa's five year old record beats the six year old record of Sophie 19th of Hood Farm (later grand champion of the breed) by eight pounds. It places the university cow in eleventh place among all the cows of the breed. It is the highest record of butter fat production made at an agricultural college.

The animal husbandry division of the university has achieved distinguished honors during the past year by establishing two new records for agricultural college herds. In April it sold a pure bred Shorthorn bull of its own breeding for the record price for an agricultural college of $5500. Now it establishes a new record of butter fat production by an agricultural college cow.

Interested Jap's Santa

The pure bred Jersey cow owned by the University of California that recently completed a record of 939.08 pounds butter fat and 15,538.02 pounds milk, a new state record and one of the 11 best records made by any Jersey.

The Everlasting Pacific

A Silo That Stands The Test of Time

When you build a barn you build it of the best lumber for that purpose. You do so because you want it to stand and give service.

That's why we use California Redwood in Pacific Silos—we build them to stay built and give you service all the time.

All staves are milled to the true circular outline of silo, both inside and outside. Each piece is chosen for its durability and permanency — is free from pitch, knots and other imperfections.

The foundation for a silo is a very important point. It must be perfectly level and strong. We will supply foundation plans for the Pacific silo or will install it complete for you.

Pacific silos are very simple and easy to build. Once built they stay built, need no attention and are not affected by changes of weather.

All Pacific silos are fitted with self-adjusting, straight-pull spring lugs. By using spring lugs at even distances around your silo, it is not necessary to tighten and loosen hoops. This is one of the most important features of silo construction.

Solve Your Water Problem

Nothing adds so much to the efficiency and convenience of a farm as a water tank. It saves time, labor and money, and assures you of water all the time.

Pacific Redwood Tanks are built like Pacific silos—strong and everlasting. Our patent non-shrinking feature does away with all chance of leakage. A Pacific tank is always tight—the hoops never need adjusting.

For your irrigation system or pipe required on the farm, let our engineers lay out your plans and solve your problems. Pacific machine banded pipe lasts a lifetime.

California Dairy Council
NOW

Don't wait for someone to call on you and argue you into it.

Everyone admits that milk and all milk products should be advertised to the public but there is no one to furnish the money unless it be those who will profit by the increased trade that is sure to follow.

The present high prices are admittedly profitable, but they spell danger in the future.

Thousands of consumers are already using substitutes and many more will do so.

Substitutes are persistently advertised—dairy products are not.

California Dairy Council will advertise them if You will furnish the money.

Send in your subscription voluntarily—don't wait.

If the money of those who have already subscribed is spent in sending solicitors to see those who have not there will be just so much less to spend in getting new business.

Vive la France

Ovid Pickard, an Oregon farmer of French descent, whose pride is his ancestry led him to name a baby calf "Vive La France" at the outbreak of the great war, later developed this animal into a world's champion cow.

Mr. Pickard went to the barn one day about the time the great war broke out in 1914 and found a new heifer calf. She was of unusual beauty and promise, and her owner felt that he should show his trust in the country of his fathers by naming the newcomer 'Vive La France." Besides having a burning desire to see France victorious, Pickard always cherished the thought of some day owning a great cow. But little chance, apparently, had a poor farmer, who rented his place, against the hundreds of men who had money and animals of seemingly better breeding.

"Vive," as they call her at the Pickard Farm, made a three-year-old record when the Huns made one of their final drives on Paris, but not much publicity was given to her first effort in those dark and doubtful days. Her first great record assured Pickard that he had a wonderful cow and he set out after another and greater world's record.

Pickard has only 15 cows, and four of them are as good as any man can own. One of these is Old Man's Darling 2d by name, and she holds the junior four-year-old record of the Jersey breed by having made 985 pounds butter fat in one year. "Vive La France," a stable mate, has just completed her record as senior four-year-old, which breaks by nearly 100 pounds the old record (made many years ago) of Olympia's Fern.

The exact figures of "Vive La France's" record are as follows: 14,925 pounds milk; 1031 pounds butter fat in 365 days; averaging percentage of butter fat, 6.91; age at beginning of test, 4 years 7 months.

By making this record "Vive La France" becomes senior four-year-old champion of the Jersey breed, and she also holds the junior three-year-old championship made a year ago, on which occasion she made 12,744 pounds of milk and 892 pounds butter fat. She has a two-year-old record of 9210 pounds milk and 633 pounds butter fat In her first test "Vive's' milk tested 6.88 per cent fat and in her second it tested 7 per cent, so it can be seen from this that she is a naturally high testing cow. Her average test of 6.91 in the latest test is not in the least abnormal, although she tested high in the eleventh month. The four-year-old record also makes her champion cow of the Jersey breed at all ages, as she surpasses the record of Sophie's Agnes, the first 1000 pound cow of the breed.

Vive la France
World's champion four year old Jersey owned by Pickard Bros., Marion, Oregon.

Milk and Cream Exhibit at Western Dairy Products Show

At the Western Dairy Products Show held at Boise, Idaho, February 10-12, 1919, there were 63 entries of milk and cream. Of these entries 54 were in the market milk and cream classes and nine in the class for cream for butter making. The judges were Ben R. Eldredge, dairy fieldman for Utah; P. S. Lucas, assistant professor of dairy manufactures, Corvallis, Oregon; and Noel Negley, dairy husbandman, dairy division, United States department of agriculture.

The winners in the various classes, together with score in each case, are as follows:

Class 1—Market Milk, Raw

First, Frutiger and Company, Portland, Oregon, 98.1.

Second, Elliot-Brant Rancho, Los Angeles, 97.8.

Third, Smith Brothers, Jersey Farm, Salt Lake City, Utah, 97.4.

Class 2—Market Milk, Pasteurized

First, Portland-Damascus Company, Portland, 97.9.

Second, Crescent Creamery Company, Los Angeles, 97.2.

Third, Independent Dairy, Seattle, 97.1.

Class 3—Milk Dealers

First, Fernwood Dairy, Portland, 95.5.

(Average of five patrons' exhibits.)

Class 4—Certified Milk

First, William Campbell, Seattle 97.8.

Second, C. W. Orton, Seattle, 97.5

Class 5—Market Cream, Raw

First, Frutiger and Company, Portland, 97.4.

Second, Charles Lehman, Portland, 97.2.

Third, Wardin and Heusser, Portland, 96.8.

Class 6—Market Cream, Pasteurized

First, Fernwood Dairy, Portland, 97.8.

Second, Crescent Creamery Company, Los Angeles, 96.8.

Third, Riverview Dairy, Portland, 96.6.

Class 7—Board of Health

First, Dr. D. W. Mack, Portland, 97.8. (Average five highest scoring samples.)

Class 8—Creamery Patrons

First, S. T. Jackman, Lynden, 96.6.

Second, W. H. Jackman, Lynden, 94.4.

Third, C. A. Pape, Nampa, Idaho, 94.3.

Class 9—County Farm Bureau

First, Whatcom County, Washington, 86.4. (Average score on five highest scoring samples.)

DOING GREAT WORK

Humboldt County has long been one of the most advanced dairying counties in California. It had the first cow testing association and the first farm adviser in California. The cow testing association has enabled the dairymen of that county to reduce their herds in numbers and to increase the returns, and the first year or two of the work of the association was not deemed sufficient, but the testing is persisted in after several years of successful work. The report for April shows really wonderful results. There

R. L. Holmes Modesto, Cal.

are 29 dairymen with cows ranging 60 or above and with monthly milk production ranging from 1000 pounds to 2222 pounds per cow. One member, George McCready, has cows testing as high as 5.1, ten of them totaling from 60 pounds butter fat to 67.8; Martin Pontino, nine cows, 63.9 pounds to 84.3; Eugene Bondini, eight cows, 60.6 to 71.1; Jeff Nissen, seven cows, 60.0 to 72.0; S. V. Foster, Jr., seven cows, 60.0 to 69.0; Iver Iversen, seven cows, 60.6 to 79.5; W. W. Turner, six cows, 61.2 to 73.8; Joe Richerio, five cows, 62.1 to 71.1; L. Costa, four cows, 60.0 to 78.6; Rieberio & Mense, four cows, 60.0 to 78.9; J. Kirkpatrick, three cows, 63.6 to 67.8; Frank Rieberio, three cows, 60.6 to 68.4; J. B. Hill, three cows, 60.0 to 70.2; Axel Kjer, three cows, 60.9 to 63.0; Peter Iverson, whose high cow produced 61.5; I. L. Moxen, 70.8; Cochran Brothers, 60.9; R. L. Chaffee, 64.2; James Kane, 60.3; Joe Dies, 67.3; Martin Nielsen, 63.3; Chris Thompson, 63.3; Tom McGowan, 68.4; Joe Ramos, 61.5; Joe Rocha, 60.0; Joe Martin, 6.45; D. J. Turner, 60.9; J. C. Kjer, 61.5; Molea and Avilla, 62.7.

NEWEST COW TESTING ASSOCIATION

The extreme northern end of the state comes with its report of some good cows, members of the Klamath River Cow Testing Association. There is some wonderfully fine country up in Siskiyou, northern Humboldt and Del Norte, and along the valleys of the Klamath are some cows that the Babcock test is calling attention to. Professor Voorhies sends list of some of their performances for the month of April. Some of the cows are giving above 60; some above 50 pounds of butter fat per month. Mrs. Sophie Blake, with a grade Jersey which shows a production of 64.08, tops the list. She also has other cows above the 50-pound line. P. F. Peini has cows ranging around 63.18, 61.95, etc. Other dairymen have cows showing butter fat production most favorable, for instance, Sero Del Ponte, 61.4, 62.73; C. P. Macbeth, 60.75; J. R. McMillan, 56.11; J. W. Webber, 51.30; A. W. Green, 52.65; Victor McFarlane, 50.31; Charles Phillips, 53.58; F. P. Fehely, 52.06; V. M. Del Ponte, 57.81; Charles Williams, 51.75; Paul Bravo, 52.89.

VALUE OF DAIRY PROQUCTS

The dairy council is putting out an increasing amount of publicity regarding the healthfulness, even necessity, of dairy products. From one of its recent circulars we quote:

Experts assert that every adult should consume at least one pint of milk daily, every growing child at least one quart, and every infant two quarts. The records of city milk distributors show the actual consumption to be between one-third and one-half that quantity, so there is opportunity to increase the sale of milk in cities from 100 to 200 per cent.

Oleomargarine should never be served on the table. It is vastly inferior to butter as food. If used at all it should only be used as a substitute for lard. Full cream cheese is a more sustaining food than meat—and costs less—but people don't know it, so they nibble at a little piece now and then with pie. Ice cream can be made into innumerable forms of desert. It is not harmful as rich pastries are; it aids in the digestion of the meal and is a healthful food also.

The California Dairy Council is being organized to carry on this advertising campaign. It is now operating with a temporary board of directors. The first annual meeting will be held July 9, at which time a permanent board of 21 directors will be elected. It is important that the membership be large enough by that date to insure a representative board and to provide enough subscriptions to justify the inaugurating of a campaign. Dairymen and creamerymen are eligible to membership.

THE AVERAGE SALE PRICE OF GUERNSEYS

During 1918 there were 32 public sales of Guernsey cattle. There were 1318 Guernseys sold for an average price of $330. The 220 cows sold brought an average of $574 a head; 517 heifers average $305; 167 bulls brought an average of $284 each and 4124 unclassified animals averaged $252.

Prince Walker Cornucopia
The Highest Record Son of Prince Gelsche Walker

His dam ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:
At seven years—
Milk 338 days.....18,849.40
Butter 866.28
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days .... [illegible]
She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

Live Stock News Notes

Kern County Auction

Kern County farm bureau announces auction sale at Wasco, June 7; McFarland, June 14; Bakersfield, June 21.

Riverside-San Bernardino Cow Testers

The Riverside-San Bernardino Counties Cow Testing Association is doing some fine work in eliminating boarders and in giving real values to workers. The association has now under test 960 cows and of these 75 produced better than 44 pounds butterfat. Amongst the big producers are cows in the herds of Howard Warren, San Jacinto, 55 pounds milk daily, 71 pounds butter fat for the month; P. Farrell, Ontario, 60 pounds milk, 54.80 pounds butter fat; Bost and Johnstone, Corona, 60 pounds butter fat; I. Pulliam, Ethanac, 61.20 pounds butter fat; H. A. Younkin, Corona, 54.60; T. J. English, Chino, 53.20; W. C. Coke, Ontario, 52.56; A. A. Gregory, Redlands, 52.44; I. V. Netzley, Chino, 52.06.

Poland-China Breeders Unite

The Fresno County Poland-China breeders have invited Madera County breeders to unite with them in the forming of a Poland-China association, and held a meeting at Hughes Hotel last Tuesday, May 27. The temporary officers were Al. Buckland, chairman; and Walter C. Ficklin, secretary.

Durocs Commanding Great Sale

R. K. Walker, secretary of the Southern California Duroc-Jersey Association, is checking up on some of the accomplishments of Durocs at recent public sales. He reports that at 175 public sales the last winter, 7729 pure bred Durocs sold for $1,613,568.02—$208.00 was the general average per head for the entire lot. These figures are very illustrative of the tremendous popularity of the Duroc-Jersey hog in the old settled Middle West sections as well as in new territory such as California.

Berkshire Breeder Now Dairying

Frank B. Anderson, Sacramento, secretary of the Western Berkshire Congress, has entered the dairy business and is selling whole milk to Sacramento buyers.

Anderson has a small lot of pure bred Holsteins, and at the recent McGillivray sale selected some of choicer lots. He expects to gradually replace his grades with pure breds, and while he does not plan building up a large herd he is determined to have the best small herd in the state.

Returns From Eastern Trip

W. M. Carruthers of Live Oak, who has been visiting the leading Shorthorn nurseries of the Middle West has returned. While East Carruthers selected a carload of extremely choice bred females and a few bulls of the same character. According to Carruthers, the man who goes East to buy good catte had best take his nerve and a long pocketbook with him. All values are on exceptionally high levels, but particularly is this true of the more fashionably bred Scotch sorts. Just before his return, Carruthers attended the notable circuit of sales including that of Frank Scofield of Texas, the world's record breaking sale of H. C. Lookabaugh at Watonga, Oklahoma, and the $1531 average sale held by Park Salter at Wichita, Kansas.

Practically all the cattle purchased by Carruthers were from the leading herds of Missouri, Iowa and Kansas. Females were even secured from the famous Ravenswood herd, Bunceton, Missouri, which, by the way, is the oldest herd of Shorthorns in existence; Allan Betteridge, Bunceton, and Harriman Brothers, Pilot Grove, Missouri. Bulls were secured from Dean C. F. Curtis of Ames, Iowa, and John Tomson of Dover, Kansas. It was from the Tomson herd that Carruthers got a splendidly bred roan son of Beaver Creek Sultan, a grandson of Whitehall Sultan, and from one of the choicest bred Clara dams in the country.

It is possible that part of the recent purchases will be included in the sale Carruthers will hold at Sacramento, July 10.

Sells Good Duroc Boar

V. F. Dolcini, proprietor of the June acres Stock Farm, Davis, has sold a yearling Duroc boar to George Dierson, Sacramento. The boar, a son of the University of California herd boar, Model Col., was a winner in the 1918 state fair futurity. Dolcini does not expect to show this year.

Thompson Promoted

Friends of Professor J. I. Thompson of the animal husbandry department of the University of California will be glad to know that he has been promoted from assistant professor to the rank of associate professor of animal husbandry.

Thompson is recognized as one of the leading swine authorities of the United States.

Sheep Expert for U. of C.

J. F. Wilson, a sheep expert now with the United States department of agriculture and stationed in Wyoming, has been engaged to take charge of the sheep investigations conducted by the University of California. Professor Wilson is a graduate of the Wyoming college of agriculture and did graduate work at the University of Missouri. He will take up the work formerly carried on by Professor R. F. Miller, who resigned to go to Texas.

Establishing a Standard

A recent addition to the herd of Duroc-Jerseys at George Junior Republic, Chino, is a young boar sired by a son of Orion Cherry King and out of Golden Model 31st. This boar is being developed slowly with the view of placing him at the head of the herd the coming season. R. A. Condee, farm superintendent, states they are establishing a standard both for their Duroc-Jerseys and Holsteins. Every cow is placed on yearly test on freshening and must show a minimum production of 10,000 pounds of milk and 300 pounds of fat to remain on the farm. While the cows are tested regularly they have not had a single reactor in three years nor a single case of abortion. Mr. Condee says, no accidents preventing, George Junior Republic will be represented at the fall shows.

A New Herd Sire

The Poland-China Ranch of San Bernardino under the management of H. B. Peake has recently secured from Hale L. Marsh a junior herd boar, Blue Valley Model, by Blue Valley Tecumseh. This boar will act as running mate for their aged boar Greenfield's Special by Superba, the grand champion at the 1915 World's Fair. Fifteen big type sows now make up the herd, which will be considerably increased this fall. Mr. Peake, the manager, states that business has been exceedingly good and the demand for bred sows and gilts has been greater than the supply, but hopes by another year to be able to fill all orders. A number of young gilts are being retained which will be bred this fall for spring litters. Recent sales include a boar and gilt to John Boyle, Los Angeles; boar to Ashdown Bros., DeVore; boar to Walter Echols, Chino, and four sows to Mr. Bennett, Victorville.

Tulare Breeders' Sale

R. F. Guerin, president of the Tulare County Poland-China Breeders' Association, states that at the recent organization of the association arrangements were made for holding a public sale in Tulare, October 9. Further details of the sale will be announced later.

A Red Letter Day for Polands

California Poland-China breeders are looking forward with interest to the sale scheduled to be held at Hanford September 17, by John M. Bernstein and W. L. Haag and Son.

The sale will be particularly notable from the fact that it will contain the largest number of Eastern bred Polands ever offered in this state. Forty head of big type bred sows selected from many of the leading herds of the Middle West will sell, carrying the service of such prominent boars as

President, Young Jumbo, Yankee Jr. and Lendorris Liberty Bond. The last two boars are bred deeply in the blood that is held in such high esteem throughout the Poland-China world. From time to time detailed comment will appear regarding the forthcoming sale.

Heath Now at Innisfail

Verne Heath, who was formerly connected with the dairy department of the Napa State Hospital, and who more recently was engaged in the dairy business in the Hawaiian Islands, is now in charge of the Innisfail herd of milking Shorthorns owned by Alexander and Kellogg, Suisun. Heath, who is one of the most expert fitters and developers of dairy cattle in the West, is planning to take a show herd on an extensive circuit this fall.

Tulare County P-C Breeders

Directors of the Tulare County Poland-China Breeders' Association have set the date for their first sale on Thursday, October 9, to be held in the live stock pavilion at Tulare and will appoint a "class" committee which will pass on all the animals submitted 60 days before the date set and again the day before the sale, so that only the best animals in the county will be offered at auction. All pedigrees will be guaranteed by the association and every effort will be made to make the sale one of the most notable for the breed in California. By-laws closely following those of the Kings County Association have been adopted and a membership campaign will be inaugurated soon. —G.

Goes East for More Cattle

R. M. Dunlap of Sacramento is now in the East and while away will select a heavy shipment of pure bred Shorthorn and Hereford bulls and females for California buyers. Dunlap has been identified with the cattle business of the state for a good many years, but states that he has never known such a keen and widespread demand for the better sort of cattle as exists at this time. Dunlap will be gone about six weeks.

Wool Growers May Have Secretary

President Fred A. Ellenwood of the California Wool Growers' Association suggests that the time has come when the association should become more active and that a secretary, preferably a man thoroughly acquainted with every angle of the business, especially marketing, be employed to devote his entire time to the work of the organization. The suggestion met with approval at the meeting at Davis and a plan for financing the work is being considered.

McNeil Holstein Sale

The dispersal sale of the well known McNeil herd of grade Holsteins at Fresno on May 16 was a pronounced success. While some of the cattle, particularly the young stock, were not in the best sale condition, the average of the entire herd was good. Among the buyers at the sale were representatives from the County Farm of Fresno County who selected some choice cattle. The sale was conducted by Col. Ben A. Rhoades and Harold B. Rhoades.

Getting Ready for the Sale

H. S. White, Chino, breeder of Duroc-Jerseys, is using as herd boar Rivera Col. by Model Col. and out of Col. B's Queen 4th, a sow purchased by H. C. Witherow, Live Oak, from University Farm, Davis. Four of his gilts are being retained and will be consigned to the sale to be held in Los Angeles some time the coming winter.

TULARE STOCK SHOW

Tulare County, which has developed in the past few years into one of the most extensive stock breeding sections of the state, will hold a big stock show this fall under the auspices of the Tulare Board of Trade at the city of Tulare, which is in the center of the Holstein and hog production of the county. Cooperating with the Board of Trade will be the Tulare County Live Stock Association, which is building a fair grounds at the edge of the city; the Tulare County Duroc-Jersey Hog Breeders' Association, the Tulare County Poland-China Hog Breeders' Association, recently organized at Tulare, and the Tulare Co-operative Poultry Association. Extensive preparations are being made to make the event a notable one in live stock circles in the state and it is planned to make the affair an annual one.

While live stock will be the principal feature of the show, provision will also be made for displays of tractors, farming machinery, automobiles and other lines allied to the live stock industry. The breeding of pedigreed draft horses has begun to develop in this section and the first display in the county of such stock will be made at the fair.

The date will be definitely set before the first of June and the show will probably be late in October or early in November.

SAN LUIS OBISPO SHOW

The San Luis Obispo County Live Stock Association will hold an annual live stock show on the grounds of the California Polytechnic School, San Luis Obispo, June 26-27. San Luis County is one of the great live stock centers of the state and it is showing interest in a higher grade of live stock, or rather in pure breds as money makers for San Luis pastures. In order to bring to the attention of a greater number of the farmers the advantage of these pure breds this association has been formed and the directors are planning for a great show. Five thousand dollars has been secured for use on exhibit features and other expenses of the show There will be a big barbecue on Friday, the 27th. One feature of the show will be an exhibit of county grammar schools and an annual field day so that there will be fun a-going for young and old. The management contemplates an attendance of at least 2000.

The objects of the association are to encourage and extend the influence of live stock breeding, to safeguard the members, to arrange for public sales of fat and other stock, to arrange exhibits at fairs, and to maintain permanent buildings for a fair on the Polytechnic grounds in San Luis Obispo.

CATTLEMEN'S NEWSPAPER

Live stock men of Humboldt County are putting out a "house organ" devoted to the interests of cattlemen of that section of the state. It is the "Stockmen's News" and headquarters is at Eureka. One of the most interesting features of the paper has to do with cattle rustlers who are to be held up to publicity through this paper.

Get ready and the chance will come.

AYRSHIRE ANNUAL MEETING

Upsetting all previous traditions, the executive committee of the Ayrshire Breeders' Association voted Springfield, Massachusetts, as the scene of the 1919 annual meeting of the Ayrshire Breeders' Association. New York and Philadelphia have monopolized the meeting for years. The choice of Springfield should prove popular and a large attendance is confidently expected June 11, 1919. The annual meeting has been held early in January, but June was deemed a more appropriate season and the constitution is being changed accordingly.

MERIT PROVES ITSELF

Senior Herd Sire

King Pontiac Netherland Segis 3rd

A grandson of King of the Pontiacs. We have 30 of his daughters in our herd, seven of which are now on official test. Three of his daughters at the average age of two years two months have made an average better than 21 pounds. He is proving his ability as a sire.

The Holsteins on Rosamaines Ranch are strong, vigorous and healthy. The daughters of our Sr. Herd Sire, King Pontiac Netherland Segis 3rd, have proven him a great sire.

KNOW—
Don't Guess
Our herd sires have proven their ability to increase the production of both milk and butter.
We are retaining all their daughters but if you desire to increase the profits of your present herd we can supply you a young bull of type and individuality and bred to increase production.

His Dam

Gerben Abbekerk Maid

Dam of our senior herd sire, a 34 pound daughter of Sir Skylark Ormsby Hengerveld, who has 27 A. R. O. daughters.

Gerben Abbekerk Maid has a seven day record of 34.45 pounds with a test of 4.29 per cent and a 30 day record of 138.19 pounds. A wonderful dam of a magnificent sire.

To the man who desires to make his future building operations secure, we say place one of our young bulls in your herd. Address

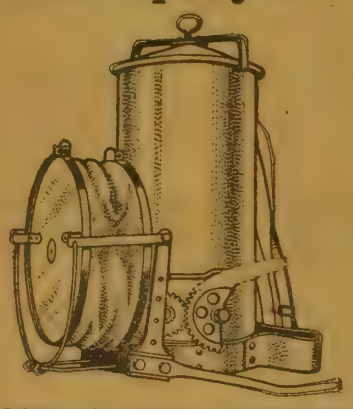
Rosamaines Ranch Stalder Bros., Owners Riverside, Calif.

Mr. Farmer

If you grow Raisins, Prunes, Peaches, Pears, Apples, Apricots, Grapes, you need a

Sahara Drier

Every year your losses run into thousands of dollars because of adverse weather conditions — overripe fruits, etc. The Sahara Drier guarantees you against such losses. It is the cheapest and best possible insurance for your crops. You cannot afford to take a chance on early rains such as came last Fall.



WINE GRAPES — Many of the California growers are making ready to dry their 1919 crop. We guarantee our machine to do satisfactory work. Our patented process makes this possible. Prices are $650 and $850 for our one-ton-per-day Drier. See our representatives for particulars:

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sex of Goslings

Is there any way by which the sex of a young goose can be determined? We have quite a flock of goslings at present and are anxious to sell off the ganders but don't know how to tell them apart. Any light you can throw on the subject will be highly appreciated.—Subscriber, Novato.

It is impossible to distinguish between geese and ganders before they mature except by size, voice and general behavior. The gander at two or three months of age is usually larger and has a coarser and more strident voice. He is also more inclined to fight and to hiss at strangers or animals. It is said the English farmers, when they wished to separate geese and goslings, used to put them all together in a pen with a dog. The ganders would hiss at the dog and stretch out their necks at him. The geese would try to run away. If you watch your flock closely you will probably be able to pick out most of the males by these three tests.—J. A. K.

Chicks Not Doing Well

I came to you some time ago for advice as to where to buy baby chicks. I did as you advised and bought 500, and as fine a lot as you ever saw. They are now six weeks old and have done finely up until three days ago. But ten or twelve began drooping, feathers looked dull and unkept, and upon examination found their crops full of a watery substance. Six have died, and upon cutting them open found the intestines covered with little yellow, ulcer-like sores. The liver looked all right. They have free range and plenty of green. I fed the first two weeks buttermilk mash and chick feed. Since I have fed cracked wheat and milk, feed meal, bran, beef scraps, bone meal, fish meal, charcoal and grit as a mash, feeding it dry and keeping it before them all the time, giving the grain first thing in the morning and last at night. The last two weeks have been very cold and foggy and have kept them up until noon with but little exercise. Will you please advise me what to do. I am putting salts in drinking water and have cut down on feed.—Subscriber, Redlands.

The yellowish ulcers or nodules on the intestines may come from mold sores which have been taken into the digestive tract from moldy food or litter, and they may possibly be due to coccidiosis. If they are from the first-named cause, in which case the disease is called aspergillosis, there is nothing to be done but to make sure that every bit of the feed and scratching litter is perfectly sweet and clean. If from the second, there should be a more or less bloody diarrhoea. Whether this exists or not, the treatment for coccidiosis can do no harm and may do good. Feed a very small amount of grain night and morning. Feed mash during the middle of the day, never leaving it before the chicks longer than two hours. Feed greens as usual. Keep buttermilk in fountains constantly before the chicks. The restricted grain ration will keep them hungry and they will consume large quantities of buttermilk. This is the treatment recommended by the California experiment station, and is equally good for indigestion. So far as I can judge without seeing the formula, your mash is rather too rich in animal protein. Better omit either beef scrap or fish meal while you are feeding the buttermilk and reduce the amount of what you use. An occasional dose of salts is all right, but the chicks will get more if it is incorporated in a moist mash, feeding not more than a quarter of a teaspoon for each chick.—J. A. K.

Tomato Blight

What is the best and most effective method to combat blight in tomatoes? I have heard of some solution to pour on the ground and allow to soak into the roots.—Subscriber, Shafter.

This is probably the true summer tomato blight. Fall tomato blight, which is caused by attacks of fungus spores on the leaves, may be prevented by spraying with Bordeaux mixture, but the true summer blight is a bacterial trouble affecting the roots, and for this there is no help whatever after the plant once shows the appearance of the blight. The blighted plant should, however, be immediately pulled and burned to prevent spread of the trouble. A preventive measure sometimes followed is to use a weak solution of copper sulphate, but the range between strength which will kill the plant and that which will prevent the trouble is so slight and varies with soil conditions so that it is impossible with present knowledge to make any recommendation.

Goat Profits

Please tell me through the Cultivator what would be a fair share of Mohair and kids for herding Angora goats, the herder to have all the fertilizer?—Subscriber, Elsinore.

Without more definite information it is difficult to answer this question. Assuming that A furnishes the goats and B furnishes the feed and labor, an equal division of mohair and kids would probably be fair.

One of the most satisfactory methods of arriving at terms would be for the herder to estimate the probable value of the clip and the kids, then to estimate the amount of expense and labor required to handle the herd and charge enough percentage to make the venture profitable to himself.

Kerosene Cure for Sick Hens

I see on page 674 in your issue of May 10 that Jean A. Koethen tussles with chicken problems in "What Kills My Hens?" I have tussled with them and will tell what I have found will cure mine. Forty-four years ago a friend gave me a fine laying hen which she said at that time was about to die with cholera as the others had. She said, "I gave her a teaspoon of kerosene oil, either to kill or cure her." Since then I have used this remedy often and the best way is to soak bread crusts in the kerosene oil. After the patient has fasted a day or two force her to eat the bread if she refuses to eat it alone. Take the case early. As to barley feeding, will say I am doing it (with dry mash) and see no ill results, yet I notice they eat grit (crushed dishes and glass) voraciously, which may be the hen remedy for barley hulls. The barley is ripe in the straw. They get exercise, beards, barley, hulls and all. There may be trouble later—I have the kerosene oil on tap, however.—F. J. Callahan.

Blackberries Not Bearing

A year ago last March we set out some blackberry bushes (Burbank's Thornless). We fertilized the ground very heavily with hen house manure,

ARCADIAN
Sulphate of Ammonia

Farm for profit. Nitrogen increases the yields, hence the profits. ARCADIAN Sulphate of Ammonia supplies nitrogen at a low cost.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A. Arcadian is the great American Ammoniate.

with the result that in a very few weeks the vines grew so fast it kept us busy building more trellises to support them. Last August we trimmed the vines quite severely, but still they grew, so that in spite of the trellises branches sprang out and trailed to the ground. Wherever they touched the ground, rootlets formed, producing a new plant. This spring, where we began with three small plants a year ago, there is a thicket about 10 or 12 feet long and about three feet wide, thrifty and vigorous, but without a sign of a blossom. What is the matter with it? Did we over-fertilize the ground, and what can be done to make them bear this year?—H. E. S., Fullerton.

Keep the young plants cleaned out and cultivate around the original plants. After another year your vines should begin to bear. If they do not, dig them out and plant the Mammoth blackberry. You will then have something that is sure to bear fruit of a fine quality. The vines have thorns that are not very vicious.—J. W. M.

Fungus on Spinach

What is the trouble with the leaves of spinach? We took good care, gave plenty of irigation and cultivation but plants refused to grow, leaves turned yellow while plants were still small.—Subscriber, Long Beach.

These leaves were quite yellow with rusty looking spots almost entirely covering the worst infested. They were referred to Professor Fawcett of the citrus experiment station who answers:

The spinach leaf enclosed contains spots containing a species of Cladosporium. This fungus has been reported as occurring on old spinach leaves and rendering them unsaleable. I might suggest that as a preventive for another year the plants be sprayed with Bordeaux mixture when young. Of course, spraying the edible leaves as the plants approach maturity would injure their sale.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Trees on Road

A private road runs across the end of my ranch. It has a row of eucalyptus on it, which feed on my land and cause crops bordering along that road to be of very poor quality. The owner of the land on the other side of the road also objects to these trees. What are our rights in respect to the removal of the trees?—Subscriber, Lakeside.

If both parties desire to have these trees removed there seems to be no reason why they could not be dug up and taken out as it is a private right of way. In any event you would be entitled to cut off the roots which intrude into your land, and in the case stated the trees would undoubtedly die.

Obligation to Sell Water

If I sell water to my neighbor for five years under contract, can he compel me to sell water after the contract expires? Can another neighbor compel me to sell water to him also?—Subscriber, Ontario.

Water being sold under written contract, no right of prescription would thereby arise in the case which is apparently stated. There is a provision to the effect that where a corporation furnished water to irrigate lands which were sold by that corporation the right to the flow and use of said water shall remain a perpetual easement to the land sold. It is further provided that whenever any person cultivating land within the flow of any ditch owned by such concern has been furnished water by it for irrigation, such person is entitled to the continued use of such water upon the same terms as those who purchased the land of the concern. It is also possible that a person furnishing water for hire may come within the provisions applicable to a public utility and find himself under the jurisdiction of the railway commission.

Tax on Bank Deposits

I have money deposited in saving's bank account in national bank. Heretofore it has not been taxed. This year the assessors insist that it is taxable. Is this correct? If the money is drawn out of the national bank and deposited in a saving's bank, will it then be exempt?—Subscriber, Long Beach.

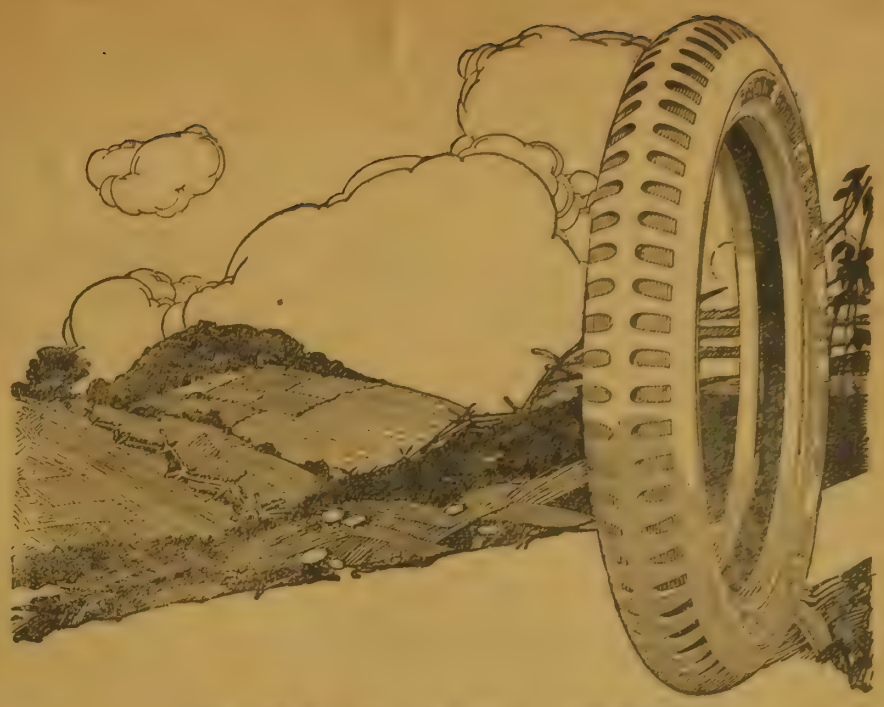
It was early made the policy of this state to favor saving's banks, and with that end in view it is specifically provided that money deposited with saving's and loan corporations or with building or loan associations shall not be assessed to the owner. A national bank cannot itself be a saving's bank, although they frequently have a saving's bank in connection. Money deposited in a national bank in the form of a term account, which may pay like interest with money deposited in a saving's bank account is not within the provisions of the law exempting it from taxes.

Blower In Sawmill

Can a mill be compelled to install blowers to blow away sawdust and shavings, and thus protect their employes from breathing them with the result that they may contract lung trouble?—Subscriber, Bloomington.

The industrial accident commission is vested with supervision over every place of employment in this state and has full power to require any employer to furnish and use all such safety devices and safeguards as shall render such place of employment safe to its employes. It is also vested with power to enforce its recommendations. The authority of this board may be invoked by filing a complaint with it specifying the particular injury and particular place which it is sought to bring to the attention of the commission.

Partnership Pump



My neighbor and I last year put in a pumping plant under a written agreement that each of us should own a one-half interest with the right to irrigate each of our properties. We each paid one-half the expenses. My neighbor bought the engine on time and I bought the pump on time. I owed him some $30 for the excess payment which he made, for which I gave him a note. I suggested that we put a fence around the place, to which he agreed, and I went ahead and built the fence. Since then we have had trouble, and he has taken the pumping belt so that I cannot use the engine. What can be done about it?—Subscriber, Fresno.

The property was held in co-tenancy and the neighbor is doubtless entitled to some lien in order to protect the payment of the note you gave him, although it would seem that you are entitled to contribution for his proportionate share in putting up the fence to which he agreed; your neighbor has no right to exclude you from entry into the common property nor to exclude you from your use thereof. It will probably be necessary for you to bring action against him upon your contract to establish your respective rights to the property and compel him to install the pump, in which action you would probably be entitled to recover whatever damages you may have suffered by way of being deprived of the use of the pump.

Estray Stock

My horses occasionally stray into my neighbor's land. He takes them up and makes me pay for them. His horses also get loose and come on my land. What should be done about it?—Subscriber, Fresno.

The law in respect to estrays provides that any person finding an estray domestic animal upon his premises or the highway adjacent may take up and have a lien thereon for expenses and costs incurred in keeping said animal, which costs are specifically detailed in the act; thus your neighbor has the right to impound your animals straying on his land, and you would have the same right to impound his horses. It would seem though, that it would be less expensive for both of you to adopt a common ground.

A RUGGED TIRE
Built To Stand Hard Service

THE Racine Country Road Tire is scientifically designed and constructed to meet the farmer's needs. It is built for the man who must drive his car over bad roads as well as good ones. It is a tough, resilient tire, *extra tested* to yield the fullest measure of extra mileage.

Racine Country Road Tires

are backed by a 5000-mile guarantee, and you can, with ordinary tire care, expect mileage far in excess of this distance. In the sidewalls of Racine Country Road Tires there is 49% greater strength, to fight road ruts. The tread is bridged up to the center to give a rugged wearing surface.

And—Racine Country Road Tires are Extra Tested in Racine Rubber Company factories. An extra test completes each stage in manufacture. This extra care in the factory means extra wear on the road

Use Racine Tires and save money.

For your own protection be certain every Racine Tire you buy bears the name

Racine Rubber Company - - - Racine, Wisconsin

Makers also of Racine "Multi-Mile" Cord Tires

100-Acre stock or dairy ranch. Situated north border of town of Lathrop, on highway; suitable for subdivision. Mrs. S. G. Reyner, LATHROP, California.

WANTED

Wanted—Salesmen and Agents. Exclusive territory granted. Powerene is equal to gasoline at 5c a gallon. Is guaranteed to be harmless, to remove and prevent carbon, doubling the life of all gasoline motors, saving repairs, adding snap, speed and power. An amount equal to 20 gallons of gasoline will be sent to any address in the U. S. for $1.00. W. Porter Barnes, Santa Rosa, California. Dept. A 11.

Manager of Large Ranches in Southern California for 20 years for one firm. Fruits, alfalfa, farming, irrigation; all practical and successful. Very highest testimonial. Desire engagement in easy reach of city if possible. Write: Manager, 628 N. Alexandria Ave., Los Angeles. Phone 597784.

Advertiser is Desirous of Corresponding with rancher who is looking for a strictly reliable man, wife and son (16). Life abstainer, non-smoker. At present foreman on farm of 1000 acres. Prefer place easy reach of Pasadena or Los Angeles. Address Hiram Cox, General Delivery, Kenosha, Wisconsin.

If You Want to Sell or exchange your property, write me: John J. Black, 116th Street, Chippewa Falls, Wisconsin.

WANTED

Wanted—Place as foreman. Advertiser is thorough in all lines of farming, fruit growing and the care of live stock. Experienced in working all kinds of labor, both tenant and wage systems. Address, Box 22, Care of Cultivator.

We Want Good Men with Small Capital to act as our representatives, open branch stores and sell our line; Teas, Coffees and spices direct to consumers. Don't delay. Write today. Best Coffee Co., 605 Crocker Street, Los Angeles, California.

Wanted to hear from owner of farm or fruit ranch for sale. O. O. Mattson, St. Paul, Minn.

Feeder Hogs Wanted. R. B. & N. Ranch, Waukena, Tulare Co., California.

CATTLE

BUTTE CITY RANCH
SHORTHORN CATTLE, SHROPSHIRE SHEEP, BERKSHIRE HOGS, SHETLAND PONIES. Stock for sale at all times. Second Farm Sale—all breeds—August 2, 1919. W. P. Dwyer and W. S. Guilford, Box C, Butte City, Glenn County, California.

Guernseys—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., California.

For Sale—35 Head high grade Holstein cows, fresh and close springers. Come and see a real bunch of cows. Cows displayed one-half mile west of Burbank on Shriner Ranch. Hannon Bros., Third Street, Lankershim. Care of Chas. Irwin.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show Herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Elkhorn Farm Ayrshires — Choice registered young bulls at reasonable prices. J. H. Meyer, 440 Montgomery Street, San Francisco, California.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Sunshine Farm Jerseys—Tuberculin tested. "Production counts." E. E. Greenough, Merced, California.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Jersey Bulls—Type and production, easy terms. N. H. Locke Co., Lockeford, California.

Registered Shorthorns — A few choice young bulls, grandsons of Fair Knight. Prices reasonable. Fair Oaks Ranch, Willits, California.

Ayrshires (registered) — A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Arizona.

Breeders of Registered Shorthorns—Milk Strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Ayrshires — Pure bred bull calves ready for service. Redwoods Ayrshire Farm, La Honda.

MULES

For Sale — Twenty-five young mules, one and two years old. Chas. Hubbard, Riverdale, California.

Do not overlook the fact that the chicks must have shade. If there is no natural shade for them to stay under during the heated part of the day, be sure and provide sufficient for their needs.

Notes from the First Day of the Poultry Institute

By Cornele G. Ross

THE opening of the Southern California Poultry Institute at San Gabriel brought so many of the devotees of her Majesty, the White Leghorn hen, to the Mission Play House that we might well have called the boulevard the Queen's Highway instead of El Camino Real.

After an opening address by Geo. D. Dake, mayor of San Gabriel, a few pertinent remarks were made by A. A. Peters on the absolute necessity of closer attention to increasing the production of our poultry and the interest which our national government is taking in helping us to bring this about. He also advised, very strongly, that we increase our efforts at cooperation and organization and that we do something to exploit the food value of the egg and other poultry products.

Prof. J. E. Dougherty then took up the subject of the day, "Principles of Feeding." Professor Dougherty stated that we feed for two purposes, namely, to maintain the body and to furnish a surplus to be used in production, but that we cannot expect to achieve results that are satisfactory unless we have a bird with the necessary constitutional vigor and vitality to resist disease and to assimilate the food we give it and turn it into meat or eggs.

Ten thousand optimists are in favor of good roads to one pessimist against them. Good roads are "the goods".

"Twixt optimist and pessimist
The difference is droll;
The optimist sees the doughnut,
The pessimist sees the hole."

Vote "YES" for the road bond measure, July 1, 1919. It is to your personal pecuniary interest.

The very complete charts made the remarks clear and instructive and should be seen to be appreciated.

The most important problem of the poultryman today is to eliminate the poor producers and breed up from the high producers to increase the average of his flock.

University Farm Ration

Dry Mash—Wheat bran five pounds, wheat shorts five pounds, ground barley five pounds, Soya bean meal two pounds, meat scrap three pounds, charcoal one-half pound, salt one-tenth pound.

Scratch—One pound cracked Indian corn, one pound whole milo, one pound barley. Or—One pound barley, one pound oats, one pound milo. Or—One pound milo, one pound barley.

Variety in a ration is very essential as it increases palatability and the greater the number of materials used in the ration the less the danger of its lacking some necessary mineral salt.

Every ration should possess adaptability to the needs of the fowl, palatability to increase digestion and variety to increase appetite. It should be properly balanced and of sufficient bulkiness and should have some natural tonic effect. Lastly it should be of low cost by selection of materials of local production.

Methods of feeding are important, and regular, systematic attention is absolutely necessary.

Scratch is preferably fed in deep litter, dry mash in hoppers constantly before the birds.

Tender green feed daily, all the hens will eat. Some animal feed, buttermilk, etc. Grit and carcoal as digestive aids and mineral matteral in the shape of shell and bone, as well as from your green feed.

As to the grain ration Professor Dougherty said that so far the experiments at Davis did not show any material advantage from the use of any particular grain but that hens not accustomed to a grain might have to be given time to learn to like any new grain before the same results could be looked for.

The food values of the different grains are so nearly similar that they may be used interchangeably according to cost, but here again he advised a mixed ration of two or more grains.

He did not think, in feeding barley or oats, that either soaking or sprouting would pay for the extra work.

After a fine lunch, served at the "Grape Vine," where most of the members adjourned at noon, the assembly reconvened at 1:30 p. m. and Professor Dougherty took up the subject of feeding again and went into the details of compounding a balanced ration.

The purpose of the egg mash is to add to the grain ration a greater percentage of protein, to help the hen by furnishing her with a portion of her food in a ground form, and thirdly to turn the by-products unfit for human consumption into the nutritive and palatable eggs and meat.

The conclusion of the University as a result of their experiments of three years back, is that the egg mash should contain 15 per cent of animal products and ten per cent of some high protein vegetable by-product like Soya bean meal or linseed meal, to get the necessary protein content, the balance to be fillers like wheat bran, wheat shorts and ground grains. (See the formula for University Farm ration.)

Professor Dougherty suggests the feeding of early hatched pullets in order to avoid early moulting on a mash of 95 per cent wheat bran and five per cent bone meal after the age of 4½ months, putting them back on the heavier mash at about 5½ months.

The aim is to prevent laying until the pullet has fully developed, which will tend to diminish early moulting and the laying of small eggs.

That great interest is shown in poultry husbandry is evidenced by a registration of 150 and an attendance of nearly 300 for the first day.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Heifer With Five Teats

I have a valuable Guernsey heifer, five months old, that I purchased recently and after receiving her find she has five teats. The extra one is growing on the side of one of the back teats. Would like to know if this extra teat could be removed by a veterinarian without injury to the main teat and if anyone has had experience along that line.—Subscriber.

Sometimes those little extra teats growing on the side of another do not give any milk but when they do they are very annoying when milking. Do not know of any having been removed but there is no reason why it could not be done successfully. Now is the time to do it. It can be done by cutting it off and bringing the edges together and holding them there with stitches or a plaster until healed. I believe a better method would be to put a clamp on tight and leave it there until it drops off. Be sure to take all into the clamp that you wish to get rid of. The last method could not fail because it works well with rupture. Make the clamp of two pieces of hard wood with small bolts through the ends. Make a groove in both pieces on the sides where they come together so it can not slip when once in place. Screw the bolts up very tight.

Do not forget to look over the young chicks from time to time for lice and mites. Hot weather is the paradise for lice and mites. So be careful, be sure, don't be sorry. Look out for lice.

THE DAY OF MEMORY

When the days grow long and the grasses glisten
Impearled with tears the night has shed,
When birds all sing and the trees all listen,
There comes to us the Day of the Dead.
Dearer than gems or golden treasure
Is their dust, whose memory Honor keeps,
And the Nation leaves its toil and its pleasure
To garland each bed where a hero sleeps.

We have grown old; they are young forever,
With glory's halo around each head.
Our names will die, but forgotten never
Are those on the roll of the Nation's dead.
Past are the pain and the bitter aching.
Our sacred dead are their country's now,
And the hearts that throbbed well nigh to breaking
Calmly above their ashes bow.

Peace to them—peace forever and ever!
Here shall no rude alarm intrude.
The jarring world shall disturb them never.
They know not of war or wars interlude.
Bring to their graves no thought of sorrow
Why should we mourn o'er our country's dead?
Their fame shall grow bright through many a morrow
And shine like the stars when the day has fled.

Bring laurel and pine for their memory immortal,
And roses, red roses, to emblem the love
Which follows them, even through the dark portal,
And pansies, for thought of their welcome above.
Bring roses — white — for their purpose holy,
And mid the sweet flowers which are strewn at its side,
Whether his rank was high or was lowly,
Set the Banner of Stars, for which each one died.

A LAND ARMY FARMERETTE

(Continued from last week.)

On that second day I stumbled to my feet stiff but cheerful. The first day, which of course was the worst day, was over. I knew how it all felt and was not afraid of the second which passed much as the first had. I was limber again, but weary in the evening. Again I rested long and earnestly. And by this time I was mentally fit to appreciate a song that I heard the girls singing to the tune of "Drink to Me Only With Thine Eyes!"

My third day, much to my surprise, found me appointed the leader for the day of the home garden squad. I was a proud farmerette and by the end of that day I felt that I was heart and soul a member of the camp.

On my fourth day of active service I was graduated from the home garden and became a real farmerette.

From that day on I spent my time in the fields, working for farmers who had requested Land Army helpers. In that part of New Jersey where our camp was located there are many large truck farms where vegetables are grown for city markets. Therefore most of our work was done with vegetables, although a few of the strongest girls helped the farmers get in the hay and harvest rye and other grains. My time was spent digging potatoes and picking tomatoes, for the most part, but I did do a litle work with hay in a barn one afternoon.

I had supposed that one could get a first-hand acquaintance with potatoes by mashing and eating them, and with tomatoes by way of making artistic salads. But that is all a mistake. A potato is more than a part of a dinner; it is a stubborn tuber firmly bedded in dark earth that must be lifted and broken and shaken on a spading fork ere the tuber is released for use. A tomato is more than a salad. It is a thing hidden under leaves on the ground and in order to crop it in large quantities one must work one's arms like a windmill and one's legs like a grasshopper, and one's back like that of the excellent safety pin, must be bent in the middle that both ends may meet. At least that is how it feels! I shall never forget my first day of potato digging nor the long days of tomato picking.

On the day when I went out first to harvest my dinner acquaintances, the Irish-Americans, our squad leader, a tall, strong, kindly woman who is a teacher in the winter time, told me to work slowly and steadily until I was quite accustomed to labor of this kind. Working slowly was easy enough. Working steadily was quite another matter. The earth under those long rows of potatoes was moist from a recent shower, which made it very heavy to lift. The weeds rose high. "Better pull out the weeds as you go so that you can see just where the potatoes are," said the Squad Leader. "You, Peggy and Polly, you're new girls; dig just one row at a time till you get used to it." Polly and I thought we were experienced weeders after those days in the home garden but weeds like these, so lusty, so tall, so tenacious of their places in the earth, we had never even seen. We tried them first with the right hand and then with the left but nothing happened. Then we gripped them firmly with both hands and tugged as desperately as if life had depended on it. The top of my weed broke off. Polly's came up at last, suddenly, and she sat down, unexpectedly. Ellen, our squad leader looked at us and smiled —but not in ridicule, fortunately for her!" I ought to have told you to loosen the earth a bit with your forks. Then they'll come up more easily," she said comfortingly.

After a while I looked at Polly and Polly looked at me. Ellen was far down the field, ahead of us, doing two rows to our one. "How do you like it?" I asked with the wicked intention of getting Polly to admit that she was as tired as I. "Do you feel a bit sick of diging potatoes?" Polly hesitated and replied with a noble evasion. The farmerettes do not encourage groans and complaints and girls who weary others with their grumpy feelings become unpopular. Said Polly, "I am not exactly sick of it, you know but I am —content!"

After a while the farmer who was employing us came down into the field. He was carrying some big yellow tomatoes. I wanted one dreadfully. I was hot, grimy, soaked with perspiration. The cool wet acid of the tomato was very alluring to the imagination. And—that good farmer gave us those tomatoes! "Better set down and eat 'em in the shade of that tree," said he. We did. We sat there in happy misery for a short five minutes and swallowed great mouthfuls of juicy tomatoes with a speed and facility which would have seemed unnatural and impolite in the days before we became farmerettes. Polly looked at me and I looked at Polly. We laughed at each other's looks and went back to work, the farmer asking me, as I went, why I didn't bring that tree along to give us a little shade while we worked!

I have harvested a lot of potatoes since that day. On the last day before I left camp another girl and I dug and sacked nearly 20 bushels in six hours. But never have I worked harder than on that first day with the thermometer at nearly one hundred.

My experience with tomatoes was long and thorough. The work is hard —no work for slackers but usually not too hard. The girls seldom get sick and most of them look ruddy and muscular and well all of the time. What they are bearing should not be underestimated for most of them have never done labor that needed muscular strength and perhaps never would have done it but for patriotic reasons. On the other hand, parents can feel reasonably sure that if their daughters are in good health and working at a camp where the food is good and the opportunities for bathing adequate, the work will not hurt them but be a positive blessing.

"Making market" is the easiest and quite the jolliest of all jobs, because while you are doing it you can gossip or sing. We sat down on inverted tomato baskets and waited while the farmer tore up strips of faded serge. Then he gave us each a piece and set us to work to polish the tomatoes we had picked. Carefully and quickly we rubbed the dirt away and sorted the tomatoes.

When this work was done the farmer brought in great wheelbarrow loads of beets and some bunches of cut twine. We were to tie beets. "Five to a bunch," said he, "and the biggest at the bottom, in the center. Six little ones in a bunch when the larger ones are gone. Pick off all withered and yellow leaves and tie 'em tight."

When we had finished, the beets were soothingly dipped in a tank of cold water, to cleanse and freshen them. We envied the beets.

The work is hard, as I have said, and very often we ached from head to foot. But the work was done with song and laughter. And it was good work. I shall always be happy in the memory of the days when I was a farmerette, of the camp at the top of the hill, the fine spirit of the girls who lived there, and the small green and white flag floating under Old Glory.

IN MEMORY OF JANE DELANO

Memorial Day is a fitting time to recall the recent death of Jane Delano, director-general of the department of nursing of the American Red Cross. Miss Delano died in France on April 15, where she had gone only a few months before in furtherance of her work.

The May number of the Red Cross Bulletin is entirely given up to tributes to her life, her work and her personality. We give one incident which perhaps indicates the force of character which enabled her to accomplish what she did:

Miss Delano had her first dealings with the German Army when she was a young superintendent of nurses of the yellow fever hospital at Jacksonville, Florida. At that time she was only 25. A waxen-mustached, superior mannered young army physician arrived to inspect American methods of treating yellow fever. He walked about the wards for a few days, greatly to the amusement of the nurses, until finally he concluded that he had learned al there was to be found out. He presented himself at Miss Delano's desk.

"I desire that my trunks be sent down to the station in the morning, Fraulein; I leave at 10."

The tall young superintendent looked at him.

"But, you know, Dr—— we are under quarantine, and I can't allow you to——"

"Oh, I understand your rules and regulations!" interrupted the German. "I know that it is required, but as for me, I am different. My government needs me, and I go in the morning."

She explained again the danger of the contagion, and the rules which governed the hospital. The officer grew emphatic. Finally she reached over and touched the bell on the desk, her mouth firm, but the twinkle still behind her grey eyes.

"Conduct Dr—— to ward No. 4," she instructed the orderly who answered her call. "He will be our guest there until further notice. Report to me if it is necessary to put him to bed, and I'll decide then whether he goes on ordinary or fever diet!"

Dr.—— remained at the hospital until the quarantine was lifted.

TWO GOOD RECIPES

By Ida M. Mowry

A Quickly Prepared Fruit Salad

One apple chopped, two celery stalks chopped fine, 24 Muscat grapes or raisins seeded, one teaspoon sugar, one tablespoon sweet cream, one-half cup nut meats. Stir all lightly together with a silver fork. Serve in orange shells or on fresh lettuce leaves.

Nut Raisin Cake

One-half cup fat, one-half cup sugar, one-half cup honey or Karo syrup. Beat to a cream. Add one egg, beaten in mixture.

One-half cup sweet milk, one-half cup raisins, one-half cup nut meats, one-half cup ground chocolate, one-half teaspoon vanilla extract, small pinch of salt, one full teaspoon baking powder, one-fourth scant teaspoon baking soda, mixed in 1½ teacups sifted flour. Slow oven as for Devil's Food.

PRUNE PANCAKES

Two cups of flour, one-half teaspoon of soda, two eggs, one cup of sour milk, one cup of stewed prunes, chopped, one teaspoon of sugar, one pinch salt. Put flour in pan, add salt, sugar, sour milk and yolks of eggs; use enough sour milk to make thin batter, add chopped prunes and lastly the beaten egg whites, and the soda dissolved in hot water. Serve with a syrup made of one cup sugar added to one-half cup of stewed or baked prune juice.

HOW JIMMY WAS BROUGHT BACK

Jimmy, the soldier boy from the mountains, was slowly dying. He had slipped into the Slough of Despond. Slowly but visibly he sank, and no word of encouragement from the solicitous nurses in the general army hospital in North Carolina brought a gleam of hope to his heavy black eyes.

But one day a representative of the recreational branch of Red Cross service brought into Jimmy's ward a trio of mountain boys armed with banjo and guitar, and made them sing and play for the patients. The lilt of a merry folk song semed to arouse the languishing Jimmy. It fanned a fading life spark that had been beyond the reach of material aids.

Eventually Jimmy admitted that he "useter pick one o' them," indicating a guitar, "as a kid in the backwoods." "Want ter try yer han'?" asked one of the three who proffered a handmarked and scarred guitar to the invalid. The Red Cross worker, with the sanction of a nurse, encouraged the boy. Fumbling with the strings, he produced a few chords, his eyes brightened and he smiled. "It kind o' comes back to a feller," he observed.

"How would you like to have a guitar to practice on while you are getting well?" asked the Red Cross worker. "Oh! Oh, I'd sure like it. Mebbe the doc won't stand for it!" But the doctor did "stand for it" the next day—and for a little while each day. And Jimmy got a new grip on himself; his thinking was objectified a bit, and he looked forward to the practice hour impatiently.

Now Jimmy is in a convalescent house and is frequently in demand as a one-man orchestra.—Red Cross Bulletin.

HELPS FOR CLEANING DAYS

There is nothing more helpful for cleaning days than gasoline, but it should never be used when there is a fire or artificial light in the house. Wipe up matting with a cloth wrung from gasoline and the colors will be freshened and brightened. Clean curtain shades by laying them on the floor or table and rubbing with the gasoline. Paint is readily cleaned by its use and the most delicate enamel will not be injured by a liberal rubbing. To remove grease spots from mattings and rugs, dissolve one teaspoon of common salt in a pint of gasoline and if necessary apply the fluid a second and third time. As a destroyer of bedbugs it has no equal. Any kind of vermin will yield at once to its gaseous influence.

Every spring the house should be fumigated with formaldehyde. This will kill off all living moths and worms in carpets and furniture.

To make a good and cheap polish that will keep your windows shining, mix well together a pound of whiting, one-fourth pound of borax and enough coal oil to make a firm paste. Rub over the glass and let dry, then wash off with hot water. This preparation is also excellent for cleaning silver and brass.

To make an excellent soap solution dissolve a bar of soap shaved fine in a pint of boiling water, then stir in a tablespoon of borax and when wanted for use stir in enough of this solution in hot water to make a good suds. There is nothing better than this dissolved soap for washing lace and muslin curtains, counterpanes and blankets. By using strong, hot suds made with this solution for cleaning out the pantry and closets, and then sprinkling a little dry borax powder on shelves and around edges of floor it will help to keep out moths and roaches, and when moths are troublesome it is well to mix a little camphor gum with the powder.

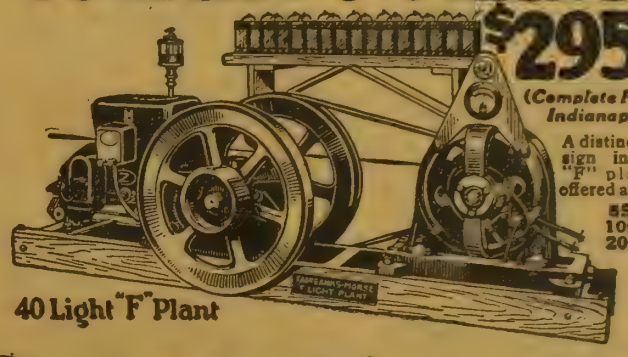
Old leather covers of chairs may be freshened by rubbing lightly with a soft sponge dipped in the well beaten white of an egg, and sometimes a cloth wrung from hot milk will restore the luster of leather furniture, and to keep the woodwork shining, go over it quickly with a soft cloth wrung from warm water, then rub with a dry cloth and rub to a polish with a clean cloth.—A. M. H.

All ugly objects about the home grounds should be removed or if this is impossible plant ornamental vines nearby to hide them from view.

Farm Light and Power

HERE is a farm light plant that you will like—for its economy and utility. Just remember that even this exceptionally low price secures Fairbanks-Morse quality—design—workmanship and materials. Touch a button to start and another to stop.

The low speed engine with ball bearing dynamo assures long life—less attention—lowest possible maintenance cost. The 40 light "F" farm plant comes completely mounted on one base with our famous "Z" *kerosene* engine, which in addition to electric lights gives mechanical power to operate a washing machine—cream separator—churn—or other machines. Instrument board is conveniently mounted over the dynamo. Unquestionably the biggest value in the farm lighting field—and you get the added advantage of mechanical power.



There is a dealer near you who will carefully explain all details and also prove that it is the one *practical* combination plant for which you have long been waiting.

40 LIGHT "F" PLANT

$295

(Complete F. O. B. Indianapolis)

A distinctive design in larger "F" plants is offered as below:

Belgian hares 14.

LIVE STOCK

Very liberal receipts of steers, cows and lambs with no increase in the demand for the dressed product, are the factors that have made the entire live stock market in this city weak and lower. Hog receipts alone have been moderate but the demand for dressed pork at the prevailing high prices for live hogs has caused the local killers to reduce their killing quota and has driven a few slaughters off the market entirely so far as hogs are concerned. An undertone of weakness is apparent in recent purchases of hogs and local packers freely predict that prices are on the decline.

Cattle prices have declined 50 cents per cwt. in the last week and the market is still weaker at this decline.

Lamb receipts are in excess of requirements and it is found necessary by some local houses to ship their surplus stock of live lambs to Eastern markets to relieve the congestion. Large shipments of California lambs are being sold on the Kansas City, Omaha and Chicago markets at very satisfactory prices.

Wethers and ewes, in sympathy with lambs, are also weak. Texas sheep are being shipped to the Kansas City market in large numbers and this has tended to weaken the market there and its effect is felt locally since that market is the main outlet for our surplus.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Cattle:
Good steers .....10.50@11.00
Medium steers .....9.50@10.00
Common steers .....8.00@9.00
Good cows .....9.00@9.50
Medium cows .....7.00@8.00
Common cows .....5.00@6.50
Hogs No. 1, 175-225 lbs.....19.00@19.50
Hogs No. 2, all other weights..17.00@18.00
Sheep:
Lambs No. 1, 55 to 75 lbs.....14.00@14.50
Lambs No. 2, 65 to 80 lbs ....12.50@13.00
Wethers .....10.00@11.00
Ewes No. 1 .....8.00@9.00

POTATOES AND ONIONS

These are the actual prices obtained May 27 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Rye: 3.65@3.85.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.13	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 20 tons, 41.00 per ton; 10 tons, 41.00; 5 tons, 41.50; less quantity, 42.00; smaller lots higher proportionately.

HAY

Under date of May 24, Scott, Magner & Miller says:

Receipts past week 1292 tons. Although a few cars of new volunteer oat hay arrived, there has been practically no other new hay other than first crop of alfalfa. Most of the receipts were of the medium grades of old hay which have moved very slowly as trade is light and sales are only effected with difficulty.

Choice red oat or wheat hay of the old crop has been scarce and what few cars have arrived have sold at top quotations. First cutting alfalfa heavily charged with foxtail has been offering but as this commodity is extremely hard to dispose of unless prices are made attractive dealers hesitate to buy.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers' charges of cartage, commission and handling expenses must be added according to conditions.

Fancy Wheat Hay
(light 5 wire bales).....19.00@21.00
No. 1 Wheat or Wheat and Oat Hay .....16.00@18.00
No. 2 Wheat or Wheat and Oat Hay .....12.00@18.00
Choice Tame Oat Hay.....17.00@19.00
Other Tame Oat Hay.....12.00@15.00
Wild Oat Hay.....11.00@14.00
Barley Hay .....11.00@14.00

Stock Hay .....11.00@13.00
New first cutting Alfalfa, in order .....10.00@13.00
No. 1 Barley straw, bale.....50@80

Citrus Markets

Los Angeles, May 28, 1919.

Heavy shipments of Valencias are still going forward. The market is entirely satisfactory, all the fruit being taken as soon as cars arrive. New York prices range from $3.90 to as high as $7.30. A very few navels are still being forwarded and are commanding the best of prices ranging around $4.00 and $5.00. In the central district Valencias are running heavily to large sizes but there is little trouble this year in disposing of these to the trade. Valencias are running rather small in the southern district.

Cooler rainy weather throughout the Eastern consuming sections has lowered the lemon market. Considerable weak

fruit is showing up, which also helps to bring down prices.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 22,203 cars, lemons 5510, total 27,713. To same date last season; oranges 9878, lemons 2928, total 10,806. Central California this season; oranges 4008, lemons 354, total 4362. Last season to same date; oranges 2498 lemons, 115, total 2613. Northern California; oranges 244, lemons 2, last year same date, oranges 202.

MARKET NOTES

It has been stated by C. G. Johnston, superintendent of weights and measures for California that several million short-weight berry baskets have been delivered to growers. 40,000 of these baskets have been discovered in the Florin district.

About 75 per cent of all apricots grown in Kings County are Royals but present plantings show Tilton a leading favorite.

The California Prune and Apricot Growers, Inc. have decided to take up a national advertising campaign and will push the small package.

Plantings of lettuce are being made in the Colma district for fall crop.

Los Angeles County has 8200 acres planted to potatoes; Riverside, 860 acres; San Diego, 800; San Bernardino, 620; Orange, 600; Imperial, 160; total 11,230 against 14,070 harvested last year. Largest increase in San Fernando Valley. Largest reduction Orange and Riverside Counties.

The first crop of strawberries is cleaning up in the southern part of the state.

Tomatoes: San Francisco district; planting continues in all directions but will practically be over by June 1. In one section of Contra Costa County early plantings are showing considerable bloom although the earliest tomatoes in this district generally arrive from Vacaville and Winters. Brawley district; shipments increasing very rapidly with fine quality due to ragid inspection. Thermal district; crop moving faster but no carloads in sight yet.

The first pool of walnuts has been sold by the California Walnut Growers' Association.

The organization department of the California Walnut Growers' Association has been placed in charge of H. H. Warner, formerly manager of the office of the United States bureau of markets in Los Angeles. A membership campaign will be pushed.

The Whittier Walnut Growers' Association is planning to erect a new packing plant which will have two grading, bleaching and packing units.

Diamond Brand walnut meats will be sold by the association to retailers in air-tight cans which will keep the nuts fresh for a long period.

California has planted to watermelons this year 2225 acres. Georgia is the big watermelon state with nearly 22,000 acres.

From present indications this state will have planted to tomatoes 36,166 acres.

The United States bureau of crop estimates reports a probable yield of 15,676,000 bushels of peaches in California this year. This will be more than 4,000,000 bushels larger than the crop of 1918.

Regular shipments of cantaloupes started from the Brawley district about the 20th of the month.

About half the onion crop of Coachella Valley is now shipped.

Stockton has begun shipping stock of dry onions in sack. Ice house stock is exhausted.

Reports from onion growers in Southern California indicate less seed stalks, splits, and scullions than last year, but they are numerious in certain fields.

The prune output of the Northwest will be much less than last year's. It is estimated that Washington and Oregon together will produce from 30,000,000 to 35,000,000 pounds.

The Canners' League of California has decided to increase all term contracts for pears $10 per ton up to a maximum of $47.50 per ton.

The Canners' League of California will give a $10 a ton higher price on freestone peaches for which contracts were made prior to the entry of the United States into the war.

A minimum wage scale for women workers in canneries has been announced by the industrial welfare commission. It prescribes a minimum of $13 a week or 28 cents an hour.

The Fullerton district of Orange County is shipping about 30 carloads of cabbage a week, prices $50 to $60 per ton to growers. The Huntington Beach Association and the Orange County Association are handling practically the entire output.

Recent revisions of Imperial Valley cantaloupes acreage indicate total grown this year 14,600 acres. Acreage divided by shipping points by percentage as follows: Brawley 43 per cent; Heber, 18; Westmoreland, 14; Imperial, 8; Poppy, 6; Rockwood, 4; Calexico, 4; Grape, 3.

Carload shipments of cantaloupes from Imperial Valley average 336 standard crates per car. This is the heavy loading requested by the railroad administration.

Cantaloupe inspectors in Imperial County receive $3.50 a day and transportation from the county; the distributors pay another $3.50.

JERSEYS AVERAGE $391

At the dispersal sale of the herd of Clifford F. Reid of Portland, Oregon, forty-one Jerseys brought an average of $391. The top cow was Goldie's Nehalem Beauty who was purchased by Dr. H. W. Hand of Orland for $1700. This Jersey has Register of Merit record at three years four months: Milk 365 days 12,367.7 pounds; butter fat 750.51 pounds; (World's record in class when made.) Register of Merit record at four years six months: Milk 365 days, 15,323.5 pounds; butter fat, 904.91 pounds. (Butter fat record for two years world's record at age when made.) Dr. Hand is president of the California State Jersey Breeders Association. Two other cows brought $1200 each, another, $1050. The sale was held on the state fair grounds, Sacramento on last Tuesday, May 27. It was conducted by the California Breeders Sales and Pedigree Company. Full report of the sale will be given next week.

Goldie's Nehalem Beauty 283330

FARMER PUTNAM ON SILOS

With Apologies

I reckon I might as well tell the truth and admit that silos has their bad points. Now when I first put up a stave silo on my farm at Stockbridge, Missouri, before comin' to Arizona, one of my customers, a particular old lady down to St. Joe, kicked about the butter havin' a nutty flavor. Fur a while I didn't know what to make of it, but by and by I set a watch on my feed lot, and I seen them durn woodpeckers was swarmin' around the top of the silo. On climbin' up I seen they had pecked a lot of holes all around the top and they was droppin' acorns through them holes thinkin' they was storin' 'em up fur winter. Nachually the cows et the acorns in the silage and that give the butter the nutty flavor. If they was any acorns out here in Arizona I'd put up a stave silo and sell nut butter at a high figger. Another bother about feedin' silage was that the cows liked it too well; they just about quit eatin' roughness and I had to build two silos to keep 'em satisfied. This made the milk flow so durn strong that I had to increase my milkin' force, makin' me more trouble and work. I finally give up and come out here to Arizona to rest. My advice is, don't build a silo onless you're prepared to handle more income.—Thomas Jeferson Putnam in Press Letter, Arizona College of Agriculture.

Phoenix, Arizona, is contemplating an addition to the city water supply from the Verde River. This will necessitate piping the water for a distance of about 35 miles.

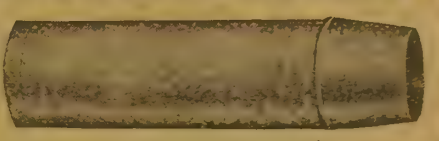
LIBERTY BEET TOPPER

BEETS PULLED AND TOPPED IN ONE OPERATION



The Liberty beet topper answers a long-felt demand.
It is simple to operate.
By test it tops better than hand topping.
Is efficient under all conditions of weather and soil.
Accurately tops high and low beets as well as large and small ones without clogging.
Attached to any riding beet digger or lifter, requires no extra horse power.
Can also be attached to riding cultivator and one, two, three or four rows topped at one time.
In saving more than a ton of beets per acre over hand topping, the Liberty Beet Topper pays for itself from approximately the first ten acres of topping.
Built of best materials; is durable; guaranteed against defect.
For information pertaining to demonstration inquire from W. M. Vance, 701 West 10th St., Los Angeles, Cal.
Send for our illustrated free booklet describing fully the merits of the Liberty Beet Topper. A card today will bring it.

This plug withstands severest service

A tractor must be ready for hard, exacting work—*always*. It must stand the hardest kind of usage. And when it is out of commission by reason of the breaking of a spark plug or the failure of a cylinder to fire, the loss of time can only be expressed in terms of actual dollars.

Don't take chances with porcelain plugs. Splitdorf Spark Plugs *DON'T BREAK*. They cannot crack or chip and they'll never leak oil or gas. In a busy season, they'll save you very many times their cost in the efficiency they add to your farm machinery.

It's important to bear this in mind—when you find SPLITDORF Plugs as regular equipment you'll know that the engine manufacturer is determined to give the purchaser the highest priced and longest lived plug made.

There is a type of Splitdorf Plug best suited to every engine. Our booklet will tell you the exactly right type for YOUR engine. Write for it TODAY.

The One Hundred Hen Farm Flock

By Jean A. Koethen

THE farm flock is in a position essentially different from that of either the commercial flock or the fancier's flock. The commercial flock is the poultryman's living. He puts his capital into it and must get a reasonable living income from it. In order to do this he must use the most efficient feeds, regardless to some extent, of the cost. The fancier, on the other hand, is working for size and perfect development and must spare neither pains nor expense to secure them.

The farm flock is a side line. It must be well nourished, but there is more actual profit for the owner, in spite of a slightly smaller number of eggs, in using the feeds that are at hand or may be easily raised than in buying expensive feeds. And this is not saying that the feed raised on the farm is not, more often than not, the very best that can be had at any price. It is simply to remind us that profit is the margin between cost of production and selling price and that he who produces eggs most cheaply is making the most money.

Bran Is Essential

The farm flock is the special care, and usually the property of the farm woman. She must plan for feeding with the least labor and must use the things at hand and what she can induce the men of the family to raise for her. One important mill feed she will have to buy is wheat bran. It may be possible to raise chicks and feed laying hens without bran, but I do not know how it can be done. A good grade of bran has a nutritive ratio of 1:3.4, which means it contains one part protein for every three and four-tenths parts of starch and sugar. It contains more protein than wheat and twice as much corn or barley. What is especially important to the growing chick is its ash content of 5.16 per cent. Ash is the mineral matter—lime, phosphorus, etc.—which would remain if the grain were burned and is absolutely necessary to the building up of the chick's frame. All grains contain ash, but bran contains twice as much as ground barley, nearly twice as much as rolled barley, and more than three times as much as corn or corn meal. Over 56 per cent of wheat bran is starch and sugar, which must form the largest part of the ration of all fowls, and so we have in this one mill feed nearly everything a chick needs for growth and a most important part of the ration of the adult fowl.

All commercial mashes, I suppose, contain bran, the quality and amount depending on market conditions, but the farm woman will be more certain as to quality and will find it easier to change her ration from week to week if she buys her bran and whatever ground grain she wishes to use with it, and mixes her mash herself. I have had satisfactory results from bran alone, with about 10 per cent of beef scrap or fish meal added, kept in hoppers before both laying hens and young stock, but it is better to add another ingredient. Corn meal is only less important in a chick's ration than bran, but it has been too expensive recently for constant or indiscriminate use, and the birds can manage without it. An ideal mash for growing stock consists of equal parts bran, corn meal middlings and beef scrap (by measure, not weight), but a mash of three parts bran, one part corn meal and one part beef scrap is nearly as good. If corn meal is not accessible, and you have ground barley, try three parts bran and one part ground barley.

The Best of All Feeds

On the farm I have in mind there is a cow as a matter of course. A farm presupposes a few pigs, and pigs presuppose cows. The woman who has a good supply of sour milk to fall back on is the best equipped person in the world for poultry raising. Edward Brown quoted a Belgian woman, who, when she was asked why she kept only 100 chickens when she had room for 200, replied, "But I have only two cows." To keep more fowls than she could provide with milk was to her mind an impossibility.

The woman who can feed sour milk ad libitum will not need to buy beef scrap or fish meal, though she will probably have a larger egg yield if she does use one or the other in her laying mash at least a part of the time. Most commercial poultrymen use a mash containing animal protein and moisten it once a day with some form of buttermilk. For her baby chicks she may moisten the mash with the milk almost from the first. Bran and rolled oats moistened with clabbered milk and fed four times a day makes a splendid growing ration for little chicks, and they might do very well on bran alone moistened in this way.

Very few scientific feeders set the milk before either chicks or hens. They prefer to use it with the ground grain in the mash, or to feed it as cottage cheese. Any liquid set out in pans is bound to be wasted and filled with filth and it is generally believed that milk fed in this way is conducive to intestinal worms, perhaps because it is not clean. Fed as cottage cheese, either in the mash or out of it, it is eaten up quickly, and the birds get the protein and lactic acid without the water which is 90 per cent of all milk.

Sour milk is the best preventive of white diarrhoea in chicks and the only cure for coccidiosis. It produces "milk fed" fryers and broilers, and is the ideal turkey feed. The woman who has sour milk at her disposal need not be afraid to undertake any poultry enterprise.

The Vegetable Mash

Most women, I believe, like to feed the warm morning mash of cooked vegetables and ground grain, and the farm woman is fortunate in having a larger supply than most of us of vegetables that can be used in this way. Unmarketable potatoes, all kinds of vegetable skins, apple skins, outside leaves of cabbage and cauliflower, squash, carrots, turnips, practically all kitchen waste save orange and lemon peel, banana skins and pea pods may be used in this way. Cook them together in the morning if you have dinner at night, or in the afternoon if your dinner is at noon. Thicken with bran or rolled barley or corn meal or all three. Add the scrapings from the mush kettle, cut-up outside lettuce leaves or other greens and a handful of beef scrap if you happen to have it, and you have a dish fit for the finest bird in the world.

When both vegetables and sour milk are available, as they are on most well equipped farms, there will be some question as to how vegetables should be used. The milk is best used in the moist mash, and one could hardly use both milk and vegetables at once, even if the mash were not more easily mixed with milk. Where such a plethora of riches is at hand it is probably better to cook the potatoes and vegetable skins quite dry and feed them by themselves. Some of these vegetables and vegetable waste, like the outside cabbage and cauliflower leaves, can be thrown into the run without cooking, but I have never been able to induce my hens to eat raw potatoes or vegetable skins, except those of tomatoes. When they are not needed for the mash, these things must be fed in the easiest way, but they must be fed, for they contain valuable nourishment and save the more expensive grains.

Use a Dry Mash

The main dependence for egg production must be the dry mash, no matter how many hens are kept or what else they are fed. This need not be complex. It may, as I have hinted, consist of bran and beef scrap and nothing else. Hens that are on good range may lay well on a moist mash once a day, but hens that are confined should have the moist mash supplemented by a hopper of dry mash from

which they may help themselves at any time.

On a farm where corn and milo are raised there would be economy in having a small power mill such as I saw in the feed house of a fancier recently, so that corn meal and ground milo could be prepared at home. With these two feeds and wheat bran, the farm woman has all the ground grain she really needs. Milo contains a little less fat than corn, but can be used in its place with bran in the mash. Possibly the chief reason why farm hens do not produce as egg farm hens do is that the dry mash is so often neglected.

Feeding Barley

The scratch grain for the farm hen will not differ materially from that used on the egg farm, save that the farmer's feeding should be limited to what he raises. In most cases this will be barley, milo and kafir, but there is no reason why it should not in many cases include wheat and Indian corn. Barley is the most common grain used on California farms, and it is a mighty good feed, quite as good as wheat, many poultrymen think, if properly fed. Its nutritive ratio is a little wider, being 1:7.7, while that of wheat varies from 1:5 to 1:10, but it contains more ash than any but the shrunken wheat, more fat and about the same amount of crude protein.

The only objection to barley is its hull, which makes it hard to digest if fed whole, but there are so many other ways of using it that it rarely needs to be fed whole. It may be clipped ("scoured" means the same thing, I think), that is, have part of the hull removed; or it may be hulled entirely. Most frequently the farm woman feeds it in the form of "rolled barley." This is better than feeding the dry, whole grain, especially if the barley is steamed by soaking in hot water over night. Better still is sprouting, which is easily done and makes the grain more palatable than rolling besides adding at least a green flavor.

To sprout barley, soak the whole grain in cold water 24 hours or longer, then turn into a tray or box with holes in the bottom for drainage, set in a shady place, cover with a burlap sack and keep moist till the white roots begin to show. In warm weather it is necessary to wet the barley once a day while it is sprouting. In cloudy, damp weather, it needs no attention. Hens simply go wild over barley sprouted in this way and can consume a large amount of it.

With a meal of sprouted barley at noon, milo (a quart to 15 hens) at night and the moist mash in the morning; dry mash before them during the day, and green feed in between if they are not on range, farm hens are as well fed as any hens in the country, and if they are not a profitable crop it is the fault of the ration.

EIGHTH NATIONAL EGG LAYING CONTEST

By T. W. Noland, Director at Mountain Grove, Missouri

Six thousand eighty-four eggs were laid during the month of April by 300 hens, making an average of 20.28 eggs per bird. Pen 4, S. C. Rhode Island Reds, from Alabama, again wins the cup, having laid 139 eggs during April.

Following are the leading pens of each variety for April: S. C. Reds, Alabama, 139 eggs; Brown Leghorns, Kansas, 125; White Wyandottes, Illinois, 124; White Rocks, Missouri, 122; Black Langshans, Missouri, 122; S. C. White Leghorns, Missouri, 120; R. C. Reds, Missouri, 119; Barred Rocks, Missouri, 118; R. C. White Leghorns, Missouri, 118; Buff Leghorns, Missouri, 116; Anconas, Missouri, 114; R. I. Whites, Connecticut, 113; Silver Wyandottes, Missouri, 112; Buff Wyandottes, Vermont, 106; Buff Orpingtons, Missouri, 105.

The ten leading pens to date are as follows: R. I. Whites, Missouri, 643 eggs; Buff Orpingtons, Missouri, 623; R. I. Whites, Connecticut, 619; R. C. White Leghorns, Missouri, 608; R. C. White Leghorns, Missouri, 591; Buff Orpingtons, Missouri, 576; White Wyandottes, Illinois, 575; Silver Wyandottes, Missouri, 566; Silver Wyandottes, Missouri, 550; Black Langshans, Missouri, 538; White Rocks, Missouri, 538.

Bees Help Cotton Growers

The lack of some cotton plants setting their bolls caused an investigation, and a specialist in charge of the work was the late Roland M. Meade. An account of his investigations recently appeared in the Journal of Heredity:

"Although the writer's death prevented any further investigation, his preliminary notes on the subject are very suggestive, and may lead to further studies on this line. As far as information goes, it does not appear that any experiments of the kind described below have been as yet undertaken in the cotton growing islands of the West Indies. Such experiments and their results will be well worth recording. Much of Mr. Meade's paper is reproduced below.

"The percentage of cotton flowers that develop into mature bolls is generally low. Even under the most favorable conditions many of the buds do not reach the blooming stage, and many flowers that open fail to set bolls.

"Inadequate pollination may be considered as a possible cause of the shedding, when the flowering stage had been reached.

"The cotton flower is a large, cup shaped blossom; it is borne in an upright position on the upper side of the fruiting branch. The pollen grains are very large, and have moist spinose surfaces, so that they tend to cohere when freed from the anthers and are not carried about by the wind.

"The period during which fertilization is possible lasts only a few hours. The flowers open soon after sunrise, commence to wither as the temperature rises in the middle of the day, and close in the evening when the stigma is dry. The second or third day after blooming, the petals, stamens and pistils separate from the rest of the flower and fall from the plant.

"In some types the relative position of the stigmas and stamens is favorable for self pollination.

"Most of the flowers with long stigmas projecting above the stamens do not become completely self fertilized, as the anthers and stigmas are too widely separated. The flowers of many of the long staple varieties are of this type, the stigmas often exceeding the anthers by 15 millimeters. The bolls resulting from such flowers have 23 to 45 per cent of aborted seeds, and it seems not unreasonable to attribute this abortion in part to the lack of perfect pollination. Flowers with short stigmas imbedded among the upper stamens are readily self fertilized. Erect stamens, either long or short, are also favorable to self fertilization, since they bring the anthers in close proximity to the pistils.

"Cotton bolls have three to five locks or compartments, each containing from six to eleven ovules, the number varying with the type of cotton. Few locks of long staple types contain more than nine seeds, while most of those of big bolled, short types have at least eight seeds.

"It was found by preliminary investigation that the bolls failed to set unless at least 25 grains of pollen were applied to the stigmas; even with this number, only one or two seeds matured in each lock. As each lock contains from six to eleven ovules, it is necessary for at least 25 to 55 grains of pollen to reach the stigmas in order that all the ovules of a four or five locked boll be fertilized.

"It is evident from increased yield of bolls secured in the long pistiled Durango variety through artificial pollination that the presence of additional pollinating insects would aid in reducing the high percentage of shedding. The value of honey bees in this connection is recognized in some localities, and it would seem that growers of long stapled varieties might find bee keeping a distinct advantage to the cotton crop."

Pinch out the tops of onions that are forming seed pods or the bulbs will not develop properly.

It fits your farm

You buy modern machinery to plow and sow and harvest because you know it pays. Modern machinery on your farm is an investment.

The Calco Bin is an investment—that pays dividends every year just as a savings account at your bank.

It fits your farm—makes buying modern machinery consistent by putting on your farm a modern, grain-saving storage bin also. It saves grain and saves profits for you. The Calco fits your farm.

CALCO GRAIN BINS

15c or 33c—Which?

HAULING a ton of farm products is costing you either 15c or 33c for every mile, depending on whether you use motor trucks or horses.

The U. S. Department of Agriculture says that it costs 15c per ton mile to haul corn and wheat to market with motor trucks and that it costs 33c to haul corn and 30c to haul wheat with horses. This is the average for the country. In some sections, it costs 49c to haul corn and 42c to haul wheat with horses.

There is One Best Way

to haul farm products by motor truck and that is to use the dependable International Motor Truck with service and quality built into it to the last part. Our many years of experience in developing and selling power equipment for farm use—engines, tractors, and all kinds of farm machines—and all the knowledge of farm conditions that experience has given us, are built into the International Motor Truck. It will prove as useful, as convenient and as profitable as your engine, tractor or automobile—perhaps more so.—Every part—engine, transmission, internal gear drive rear axle—is made to work efficiently with every other part under country road and load conditions. It is a truck you can afford to buy and afford to use. There is a style of body and size of truck to meet practically every hauling requirement.

Give us your annual tonnage to and from town, and we will tell you whether or not an International will prove a profitable investment. Write now so you will have complete information to use when you need it.

Plain and Pleasant Talk About Fruit, Flowers and Farming

WE MODERNS sometimes think we have a copyright on modern ideas. We observe more accurately the processes of nature and study more deeply into her mysteries than did the farmers of the last century. Our foredads swung the cradle, raked and bound by hand, and were content to work sixteen hours a day; and without such necessities as the telegraph, the telephone, the phonograph, the flying machine, or even the auto. But perhaps they did think of some of nature's deepest problems more than we ordinarilly give them credit for. This point was brought out in his welcoming address by Mayor Horace Porter of Riverside before the fifty-first State Fruit Growers Convention last week. Mayor Porter quoted from "A Plain and Pleasant Talk about Fruits, Flowers and Farming," written by Henry Ward Beecher in the columns of The Indiana Farmer in 1835. Mayor Porter remarked that the little town of Indianapolis, then with less than 4,000 inhabitants, afforded an indifferent living for the talented young preacher and he was compelled to increase his subsistance by writing for the columns of the farm paper. The quotation made by Mayor Porter sounded so like an editorial which we would write if we could that we are glad to give it in full.

By Henry Ward Beecher

We understand very well that every region must fashion its system of agriculture upon the nature of its soil, its climate, etc. The principles of agriculture may be alike in every zone, but the processes depend upon circumstances. It would be folly for a new country, without commerce, to imitate an old country with an active commerce; it would be folly, where land is cheap, abundant, and naturally fertile, to adopt the habits of those who are stinted in lands, who have a redundant population, and who find a market for even the weeds which are indigenous to the soil. The husbandry of Holland is suited to a wet soil, and of England to a humid atmosphere and a very even annual temperature. But our soil is subject to extreme wet in spring and dryness in summer, to severe cold and intense heat. A farm whose bottom lands are reinvigorated by yearly inundations, may thrive under an exacting husbandry that would exhaust an upland farm in a few years. Modes of agriculture must be suited to circumstances. Nevertheless, the experiments and discoveries and practices of every land are worth our careful attention. We do not import clothes—but we do cloth, to be made up to suit our own habits and wants.

The two extremes of husbandry are, the adoption of every novelty and every experiment indiscriminately, and the rejection of every new thing and every improvement, as indiscriminately. Wisdom consists in "proving all things and holding fast that which is good." We do not advocate large outlays for expensive machines—for fancy cattle, for every new thing that turns up. But when, after full trial, it is ascertained what are the best farm horses, the best breed of cattle, the best milch cows, the most profitable breed of hogs and sheep, and the most skillful routine of cultivation, we think our farmers ought to profit by the knowledge. It is never a good economy to have poor things when you can just as well have the best. This, then, is

OUR CREED

We believe in small farms and thorough cultivation.

We believe that soil loves to eat, as well as its owner, and ought, therefore, to be manured.

We believe in large crops which leave the land better than they found it — making both the farmer and the farm rich at once.

We believe in going to the bottom of things and, therefore, in deep plowing, and enough of it. All the better if with a subsoil plow.

We believe that every farm should own a good farmer.

We believe that the best fertilizer of any soil, is a spirit of industry, enterprise, and intelligence—without this, lime and gypsum, bones and green manure, marl and guano will be of little use.

We believe in good fences, good barns, good farmhouses, good stock, good orchards,—and children enough to gather the fruit!

We believe in a clean kitchen, a neat wife in it, a spinning-piano, a clean cupboard, a clean dairy, and a clean conscience.

We firmly disbelieve in farmers that will not improve; in farms that grow poorer every year; in starving cattle; in farmers' boys turning into clerks and merchants; in farmers' daughters unwilling to work, and in all farmers ashamed of their vocation, or who drink whisky till honest people are ashamed of them.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County has begun harvesting its big grain crop.

Vacaville estimates that the prune crop in that vicinity will bring in $600,000.

The Farmers' Union is holding meetings in Modesto, June 6, and in San Jose, June 7.

There are 475 farm bureau centers in California with a membership of over 22,000 farmers.

Arbuckle, Colusa County, almond growers have decided to enlarge their warehouse.

Shearing is well under way in Mendocino County; many sales are being made at 60 cents.

The United States biological survey is preparing for a big ground squirrel "drive" in Butte County.

Some rice growers of Yuba County it is feared may lose their crops because of delay in putting on water.

The Broughton bill authorizing irrigation districts to develop, distribute and sell electrical energy has been signed by Governor Stephens.

Governor Stephens has signed the bill which provides a public camping ground in Placer County at Tahoe City, on the shores of the lake.

Peach growers now under contract with canners are preparing to ask for higher prices to keep pace with the increased cost of labor and materials.

The Penobscot Farm Company of Eldorado County has stocked with milch goats 3000 acres near Cool. The milk is to be used for making goat cheese.

That the government price on rice will be maintained until the 1918 crop is cleared up is the positive statement of J. J. Crowley of the United States Grain Corporation.

The Glenn County farm bureau is seriously taking up the problem of drainage of rice lands and lands adjacent. Orchards are said to be suffering from the rising water table.

Tuolumne County will soon have a horticultural commissioner. The appointee, it is understood will be Mr. Gilkison, who has been teaching agriculture in the Sonora high school.

Sheepmen of northern Sonoma and southern Mendocino Counties are being offered 60 cents and better for their wool clip. Sheep have wintered well and the clip is excellent.

The Butte City district of Glenn County has asked the state land settlement board to consider it as a site for a second settlement colony similar to that now established near Durham in Butte County.

George P. Weldon, for several years chief deputy state horticultural commissioner, has resigned from his state work and will take a position in Ontario, San Bernardino County. He will also direct the work of the experiment station of the Chaffee Union High School.

That the extermination of ants in Alameda should be undertaken at once and that a campign to this end is soon to be launched under the direction of the University of California extension department is a recent announcement. So prevalent have these pests become, it is claimed, that damage amounting to thousands of dollars is done yearly in the city, to say nothing of the annoyance they cause householders.

Central California

Lodi, San Joaquin County, is sending out carload shipments of lettuce.

The cantaloupe outlook in the Turlock section is of the best.

The California Peach Growers, Inc., has announced prices on "Practically Peeled."

Clovis, Fresno County, claims to be the largest shipper of table grapes in the valley.

The recent hog auction sale at Corcoran, Kings County, showed a decided slump in prices.

Santa Clara prunes are reported as practically all sold at prices ranging from 12½ to 22 cents.

Selma spinach growers are very pleased with the result of their first venture in raising this crop.

The berry special train is now making daily trips from the Santa Clara berry fields to the Bay cities.

Currant "ringing" was demonstrated at the Fresno high school last week by a government viticulturist.

The melting snows in the mountains are sending a big flow of water through the rivers and irrigating canals.

Harvesters have begun work on the west side in Stanislaus County. Prospects throughout the county are of the best.

The J. C. Forkner fig gardens at Fresno has completed arrangements for the installation of a preserving and jam plant.

At the fat hog auction sale at Tegner, conducted by the farm bureau marketing association, the top price was 18½ cents.

Practically all fruits in San Joaquin County will this year give a 100 per cent crop; almonds and pears are running a little light.

Stockmen of Tulare County are planning for the live stock show to be held this fall at the new live stock pavilion in Tulare.

Salinas Valley warehouses report a heavy demand for damaged beans which have been overflowing the warehouses for months.

Hollister, San Benito County, reports great activity in orchard real estate since 1919 prices for prunes and apricots were announced.

The last farm bureau sale at Visalia, Tulare County, showed drop in price for tops to $17.85 as against $18.90 for tops of practically the same grade at the sale of the previous week.

Kings County raisins are to be labeled, "Packed in Kings County," when handled by any plant of the Raisin Association. This action was taken after a campaign was made by the Hanford board of trade.

Order has been made for reduction in the freight rate on empty lug boxes, which are used by the packing houses and returned for reloading. The reduction will be 17½ cents per 100 pounds to 9 cents per 100 pounds. The minimum weight was stated to be 12,000 pounds on a 36 foot car

The South San Joaquin irrigation district has completed plans for a bond issue of $500,000 for its new irrigation system and the building of the Hilts Sag flume in the Stanislaus River. It was the largest wooden flume in the world and is now being replaced by concrete. They plan to finish the work in five years.

Southern California

The Riverside County Milk Producers' Association has 30 members.

Redlands is planning its first fall flower show since November, 1916.

Date growers of Coachella are planning the building of a new packing house.

The Charter Oak Citrus Association has this year handled 324 carloads of navels.

Beaumont will celebrate Cherry Day when its cherries are at their height of production.

Several sales of Durango cotton at 37 cents are reported from Blythe, Riverside County.

The Puente Walnut Association estimates that section will ship this year in the neighborhod of 2000 tons of walnuts.

Orange County is moving her biggest Valencia crop. The Orange County Fruit Exchange is at present shipping 15 to 20 carloads a day.

Rabbit raisers of Riverside County have formed the Riverside County Rabbit Breeders' Association. J. E. Copeland has been elected president.

The recent cloudy weather is feared by some apricot growers as starting a fungus which will redden the fruit and, if continued, injure it for canning.

At a meeting of the Riverside County farm bureau held at Riverside last week it was voted to ask the supervisors to appoint a fire warden for the months of June, July, August and September.

The California Walnut Growers' Association has announced that it will give a prize of $10,000 for an acceptable machine or idea which would enable the stamping of its Diamond Brand on each walnut in the pack.

To satisfy the need for trained teachers, a course in school and home gardening will be offered from June 30, to August 8, by the University of Southern California at the agricultural center of the Los Angeles city schools.

Secretary W. W. Van Pelt of the Southern California fair to be held at Riverside announces that he has received half of the necessary certifications for the Duroc-Jersey futurity show. These are from Riverside County, Chino and Van Nuys.

The directors of the Yucaipa Apple Growers' Association have assumed the responsibility of raising the valley's portion of Inspector Taylor's salary. Instead of assessing each member the plan adopted is to solicit subscriptions from all orchard owners at the rate of 10 cents per acre.

At a recent annual meeting of the Riverside County farm bureau the following officers were elected: President, J. E. Wherrell; vice-president, A. Rohrbacher; secretary-treasurer, Miss Gladys Waddell; auditor, William Babel; directors at large, J. L. Bishop, Mrs. H. E. DeNyse, C. R. Brown, Mrs. Carol McConnell, George Thomas, O. K. Kelsey and F. A. Langdon.

The San Jacinto district of the Cleveland national forest is now in charge of Ranger S. A. Boulden. He is stationed at Keen Camp. During the coming season Assistant Ranger F. E. Walker will be on duty at the San Jacinto ranger station, D. G. Spence at Vista Grande, Dexter T. Jones at the Stone Creek district and John F. McDonald as lookout on Tahquitz peak.

The Coast and General

Fifteen thousand sheep will be sheared in central Oregon this year

A considerable new acreage in Clatsop County, Oregon, is being set to cranberries.

The Columbia River packers have fixed 11¼ cents per pound as price to fishermen for Royal Chinook salmon.

The Hood River Valley, Oregon, has subscribed its quota of $1000 to the Pacific International Live Stock Exposition.

A summer course in gardening and poultry for women is to be given by the Ohio State University from June 23 to July 19.

The Salt River Valley Water Users' Association, Arizona, has fixed the assessment for water service at $1.60 for the first two acre feet.

Commercial fishing for salmon on the Columbia River opened May 1 The fishermen are demanding 11½ cents a pound for salmon.

A new classification of the state lands of Arizona is being made by the state land commission. This will classify lands owned by the state into agricultural land and four classes of grazing lands.

At a bond election held May 17, Maricopa County, Arizona, voted to issue $4,000,000 for building about 200 miles of hard surfaced roads. Other roads are being built as a part of the state highway system.

The Santa Fe has asked for a raise in rates on live stock between the Salt River Valley, Arizona, and Middle Western points. The new rates on cattle will be about $20 higher on a carload, and on sheep about $35.

A thrasher school is being held on the experiment station farm at Mesa, Arizona. This will take up repairs and adjustments of grain separators, the purpose being to show how adjustments may be made in order to save grain.

The forty-seventh annual reunion of Oregon pioneers will be held in Portland, June 19, Nathan H. Bird, 1846, vice-president, presiding. The annual address will be made by George W. Riddle of Douglas County, a well known pioneer of 1852.

Marita Butler of the Lehi district near Mesa, Arizona, has won the county championship of the Boys' and Girls' club work through her work in canning fruits and vegetables. She canned 700 quarts of fruits and vegetables during the season.

An orphan lamb club with over 40 members has been organized by the Farmers' Savings Bank in Walla Walla. The lambs were secured along the Snake River by the bank's agriculturist, C. L. Jamison, and were distributed by the county club leader. The lamb club members will hold meetings occasionally this summer and will exhibit their stock at the county fair this fall.

Air mail service has been established daily except Sundays between Chicago and Cleveland. This will advance the mails from Pacific Coast states to Cleveland, Ohio, and Boston, Massachusetts, 16 hours, and to Albany and New York, six hours from connections at Chicago. Mail intended for airplane service shall be prepaid at six cents per ounce and shall be marked "air mail."

The Use of Frozen Fruits in the Manufacture of By-Products

By E. M. Chace, Chemist in Charge Citrus By-Products Laboratory, United States Department of Agriculture

LIKE most problems connected with the frost injury of citrus fruits, that dealing with the utilization of the injured fruit for by-products presents many discouraging features. At the outset it is very desirable to have a quick but accurate estimate of the extent of the injury to the grove. The fruit on the trees may be fit only for by-products; it may be in part available for sale at a higher price than by-product factories can pay, and it may be so slightly injured that the better policy would be to leave all the fruit on the trees.

Even where accurate estimates can be obtained, in many cases the trouble has just begun. Where the injury is very great, especially in the case of lemons, the fruit should be gotten to the by-product factory as soon as possible after the freeze, in order to get the greatest returns from it. Immediately after a severe freeze, however, it is manifestly impossible to harvest any considerable part of the crop of the state, no matter how quickly or how crudely the work is done. Picking, hauling and even storage room will be inadequate, and further, the by-product plants, as at present organized, do not have sufficient capacity to handle the burden which would so suddenly be thrown upon them. Where a part of the fruit has been untouched by frost, it can sometimes be decided from experience whether it is not best to harvest the fruit at once in the low cold spots and on the outside of the trees for by-products, and permit the rest to remain for drying out. Any method of operation which saves handling the fruit in the packing house, of course, saves money for the grower. Where frost injury has been but slight, it is undoubtedly the best policy to allow the fruit to stand upon the trees for a month or six weeks in order to facilitate its drying out, and thus aid the elimination of the frosted material as much as possible, for this, at best, is rather an unsatisfactory job. Where this plan is followed, the value of the frozen fruit is considerably diminished, but the average returns from the whole will, of course, be much higher.

Taking up the specific uses to which frozen fruit can be put, we find that lemons which have been very badly frozen are still available for making citrate of lime or citric acid. Where drying out has taken place, the yield may be somewhat lowered, but in most cases a fair recovery can be made. Thomas, Young and Smith, in their paper upon the composition of frozen oranges and lemons recently published in University of California Bulletin Number 304, show that even two months after the freeze of 1913, frozen lemons contained as high as 4.79 per cent of anhydrous citric acid in the juice. With many frozen lemons, however, decomposition is rapid and the sooner they reach the factory the better.

So far as oil is concerned, our own experience convinces us that, where there is no serious surface injury, the oil content is not diminished, and the oil itself is somewhat more easily recovered than in the case of unfrozen fruit. Where surface injury has not been too great, the peel can be used for candying, drying or packing in brine. Where the pulp is not injured in flavor, it is available for use in marmalade. Past experience in Florida on grapefruit should teach great caution, however, in bottling juice from frosted fruit, even where it apparently is of excellent quality at the time of bottling.

Oranges, frozen or unfrozen, are not available for the manufacture of citric acid or citrate of lime as the acid content of the juice is not sufficient to pay for its recovery. If the surface injury is not great, the oil recovery will not be curtailed, and surface injury, with oranges, is not usually very serious. Candied, dried and brined peel can be produced from the rinds. As shown by Thomas, Young and Smith, there is a loss of sugar in the juice of frozen oranges. In our experience, there is also a considerable loss of flavor in the juice, although the pectin in the peel, which is valuable owing to its jellying properties, does not seem to be greatly decreased.

Where the fruit has not dried out to too great an extent, it can be used for vinegar making; loss of sugar in the juice, however, lessens its value as vinegar material. It is not possible to produce even with the roller process a standard vinegar where the juice contains less than 8½ per cent of sugar. With rapid process generators, the content must be even higher. The bitter flavor, sometimes present in the juice from frozen fruit, does not seem to affect the vinegar made from it. Where bottled juice is being made, it is best to steer clear of frosted material.

Grapefruit is probably more frost resistant than either of the other citrus fruits commonly grown in this state. Its uses in by-products, however, are limited. Citric acid is not present in its juice in sufficient quantity to make its recovery profitable. It contains an insufficient amount of sugar to make a standard vinegar, and while the juice can be satisfactorily bottled. it is best not to use frozen material in its preparation. The peel from frozen grapefruit is satisfactory for the preparation of candied peel, and there is no reason why the pulp cannot be used as usual in the preparation of marmalade.

It is not possible in the time allotted to go very far with the description of the manufacturing processes by which the by-products already mentioned are made. More detailed information can be secured at any time by applying to the institutions where the work has been done.

The manufacture of citric acid cannot be recommended on a small scale, the equipment being too expensive and the technical knowledge required too great. Citrate of lime can be produced with a very modest installation, however, although it hardly seems to be an economic proposition to install even this equipment for the purpose of utilizing this year's frozen fruit. There are a number of citric acid and citrate manufacturers who are in the market to purchase cull lemons at prices which could hardly be realized by the small producer from the sale of citrate alone. Information concerning the apparatus, etc., will be furnished, however, on application to the Citrus By-products Laboratory, 142 South Anderson Street, Los Angeles.

Apparatus for the manufacture of oil from both oranges and lemons is now under construction in more than one place in the state, but has not been sufficiently developed just yet to be available to the small producer. Some oil will undoubtedly be produced from frosted lemons this year, however. Just how much will depend upon the rapidity with which the machines can be perfected.

The market for lemon peel in brine, candied or dried peels, seems rather limited at present, and none should be produced unless contracted for in advance.

The question of the disposal of the unsalable frozen oranges has largely been solved by their use in marmalade, enormous quantities of which are being manufactured. Professor Cruess of the University of California has recently suggested, in the California Cultivator of January 11, 1919, a method of canning orange marmalade stock. This can readily be done, but it would seem that there is some question as to whether this country will readily absorb the large amounts of marmalade which the California companies propose to make in the next six months. It is true that this amount is probably not excessive when compared with some other preserves already on the market, but it must be remembered that orange marmalade must make its way by displacing to some extent other material more or less firmly established in the menus of American homes. The increase in production of this commodity in California this year is estimated at approximately 500 per cent and would be more than double that if all the frozen fruit were taken care of in this way.

It is also possible to produce canned pulp and frozen sliced oranges for use of marmalade manufacturers. We have recently shipped to Chicago several lots of frozen pulp for experimental purposes and have produced excellent marmalade from this same material in the laboratory at Los Angeles. Whether pulp in this form has any advantage over canned pulp is yet to be proven. The possibility of using it for soda water flavor and in the manufacture of ice cream and water ices is also being investigated.

The question of the information which should be given the purchaser on the label of marmalade made from fresh fruit, canned pulp, or frozen stock is not discussed here, since it is beside the purpose of this paper.

The department of agriculture has had for several years recipes for the preparation of marmalades and jellies from citrus fruits which will be gladly sent to any one making application for them at the laboratory.

Equipment for making vinegar on either a large or small scale is very simple and comparatively inexpensive. We have descriptive matter for distribution along this line also. The question of manufacturing on a large scale to compete with Eastern cider vinegar is a matter for consideration in the future. At the present demand for culls, however, together with increased freight rates and cost of cooperage, there seems to be no chance of competing in middle western or eastern markets with cider vinegar. Here in California, however, there is opportunity for the production and consumption of a high grade vinegar for sale to the better class of trade. There is little reason why this product should not largely replace cider vinegar in California with this trade. The vinegar can be made of excellent quality, of fine fruity flavor, but it has not a characteristic orange flavor.

The conditions existing with lemon oil are also applicable to orange oil, so that no time need be taken in discussing them.

There has been some demand for dried orange peel for use in mince meat, and also it has been rumored for use in chewing tobacco. Several carloads went East in 1917 and the demand will probably continue until the Italian product reappears on the market, when it will be a question of cheaper production or a protective tariff.

Candied peel can readily be made and should be pushed in the local markets. A fine confection can be made either plain or chocolate coated, and the only reason why it is not in every first class local grocery or confectionery is lack of introduction and pushing.

We have nothing to offer in the way of orange juice recipes, having never developed a method that would produce a first class merchantable article.

Frozen grapefruit can be used in the preparation of marmalades, a very desirable product being made to contain as high as 33 per cent.

Satisfactory candied peel is also easily produced on a large or small scale. The equipment is inexpensive and easily obtained. Now that the scarcity of sugar no longer curtails the output, I look for a considerable expansion of this trade, for it is the most easily prepared of any of the candied peels and is of unsurpassed quality. Where large quantities are put up, the time can be shortened very materially by the use of the vacuum pressure method. Here an autoclave is used for heating the peel under high vacuum, followed by a heating in syrup under pressure. The impregnation is hastened in this way and a clear article is produced. This candied peel can be cut into very thin strips and used in marmalade very satisfactorily. Directions for making candied peel can be obtained from the laboratory.

It is possible to prepare a satisfactory beverage from grapefruit, although I question the use of frozen material in its preparation. The great trouble with California grapefruit is the same difficulty that gives California grapefruit itself its generally poor reputation, i. e., immaturity. Few California grapefruit growers are willing to allow their fruit to mature before harvesting it. A. D. Shamel of this department, has repeatedly called attention to this fact and pointed out the many advantages accruing from holding the fruit until summer before shipping it. Taken late enough, the fruit produces a fine juice that can be bottled after sterilization and remains in good flavor for months. We have bottled several combinations of grapefruit with other fruit juices and like two of these blends very much. Both pomegranate and loganberry juices make fine blends. We use about 20 per cent of the blending juice to 80 per cent of grapefruit juice, and sometimes sweeten until the solids are raised to 20 per cent. This gives a

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Most of us cannot write of things of today so that they will live and be bright and fresh, and sound as if just from the pen a hundred years from now. But on the cover page of this issue is a poor preacher's attempt at helping out his living on the side by writing some stuff for a farm paper, and this back in the days of the ox team, the tallow candle and other similar conveniences. It's worth reading by the modern farmer, that creed written by Henry Ward Beecher.

BEANS UP

Beans which were only a few weeks since a drug on the market are now nearly all sold. Six or seven weeks since the market was flat. Warehouses were full, price was going down, growers were discouraged, ruined.

This gave oportunity for cooperation. Cooperation gave opportunity to protect the trade. The price advanced. The higher the price the greater the demand. The bean grower is happy.

Moral: Co —But is it necessary?

ENFORCE PEACE

There is continual asking: "Will the League of Nations really enforce peace or create a condition looking toward further warfare and unsettled conditions?" But let not this country grow faint-hearted or encourage any consideration of the question other than some definite action which will prevent another world war. The constitution which the League of Nations recommended may not be perfect, but it has been characterized as one of the greatest documents in the history of the world. In any case it is an honest endeavor to create conditions making for the world peace we all so earnestly desire.

BOY SCOUTS

The Boy Scouts of America desires to have 50 per cent of the boys of the nation within the membership and is starting a campaign to that end which will be in full swing the week of June 8-14. There are 10,000,000 boys in the country between the ages of 11 and 21, and 5,000,000 of them in this organiaztion will mean much for patriotism and even for efficiency amongst the boys. They were the best of gleaners in the Liberty Loan campaigns. Millions of dollars worth of bonds were sold by them after other organizations had done their biggest work.

It is a clean, wholesome organization, making for upstanding, square youngsters, and with it all teaching efficiency and service. Boys throughout the rural sections have been especially attracted to its membership.

LABOR

At the recent Fruit Growers Convention Frank B. McKevitt referred to the labor situation as it confronts the farmer and the labor situation as it confronts the young man returning from service. The papers are filled with plans and alleged plans for giving the young man an opportunity of getting his old job back, or a better one, and while these plans are being advertised the farmer is doing his best to get sufficient help to carry on his work, and the fruit grower who expects within a few weeks to be in the midst of the harvest season, the magnitude of which has seldom been equalled, feels helpless when he sees the difficulty of securing help or rather the promise of any help at that time. It has been claimed that if the farmer and fruit grower will pay better wages he can secure help. It is probably impossible for the producer to pay a dollar a day or even the more reasonable prices which ship builders and others were able to pay under government guarantee, but farmers have been offering forty and fifty cents per hour and, as Mr. McKevitt said in the convention; "It is an impossibility to secure the help needed." He felt that in view of this crying need of special effort the starting of great labor employing projects at this moment would prove disastrous to the producing interests. Allow the present crops to be harvested with the available labor. Many hundreds of thousands of tons will waste of the best of the fruit unless this need is met.

$50-$500

This would be a much more delightful world if the fool killer, or some other polite sort of an executioner, would start out and lay low all those who make mistakes. This might, however, be rather drastic and lead to desperately lonesome conditions, for we all do make mistakes. Of course, we always pass it on to the other man as being responsible, and no matter how just this action may be, it still does not seem to prevent after mistakes.

For the error we have in mind we are going to pass the responsibility on to the work room where the advertisements are set and the forms are made up for the pages of the Cultivator. In the issue of May 31, in the announcement of the International Dehydration Machine there is a line which should have read: "Sold on payment terms at the rate of $500 per ton basis." Some distance above, in the same advertisement is a line which reads: "Save $50 per ton in drying expense by using——, etc." This may or may not account for the distressing error which was made in putting the ad in type, for the $500 per ton basis became $50 per ton.

Dehydration of California's fruits and vegetables will mean the bringing to this state of many millions and the saving of hundreds of thousands of tons which might otherwise go to waste, and the Cultivator would encourage this industry in every way. We hasten to correct the error and to urge our readers to become better informed regarding the advantages of these dehydrators. Neighborhoods may well combine in efforts to save our fruit and vegetables which might otherwise be waste.

ALMONDS

Those who heard George W. Pierce make his address on the Almond Growers Association and the advantages which the association has given to the almond industry could not help but be impressed. When the association was formed a few years ago almond growing was only a side line with most fruit orchardists, with little satisfaction in it even as a side line, but the association has handled the marketing of the product to the end that thousands of acres have been set, and this usually because of very satisfactory returns from orchards planted in favorable sections. By far the greater portion of the almonds produced in this state are grown within a radius of 150 miles from the city of Sacramento. There are now practically 2500 growers, the larger portion of whom are members of the association.

Mr. Pierce characterized those who are not members of this cooperative organization which is making possible the success of this great industry, as commercial parasites, or, as Mr. Thorpe of the Walnut Association reported hearing a banker say: "The grower who remains outside the association and continues to avail himself of its advantages is like the patron of my bank who continually checks on my bank and continually makes his deposits in another." These "outsiders" are willing to take the benefits which the cooperative organizations bring, but they are not willing to pay their proportion of the maintenance of such organizations. Mr. Pierce, who is president of the association, proposes, however, that ultimately one hundred per cent of the almond growers of the state will market their nuts cooperatively. One point made by Mr. Pierce showed the advantages of this association—instead of sending the entire crop of the state to one or two or at most a very few large firms, more than seventy per cent of this state's output is now distributed to dealers who handle less than fifty bags of almonds a year.

PESTERING PRODUCERS

Some time ago we commented on the attack made on the Milk Producers' Association that originated on the floor of the Senate and was later taken up by certain metropolitan and even agricultural papers. It will be recalled that the investigation staged by the agricultural committee of the senate failed to develop anything of importance and that the alleged expose ended in thin air.

We remarked on this page at the time that it was conceivable that the interests that would profit most from an unorganized industry would hardly quit the field without a struggle. Our assumption was evidently correct as it appears now that the attack has shifted to San Francisco and is being made from a different angle.

One of the San Francisco papers led the fight and by rehashing many of the original charges claims to have been responsible for the indictment of a number of association officials and strikes an heroic pose as the friend of the consumer and the sworn enemy of the "milk trust" and "the profiteering dairyman."

The intelligence and familiarity with the problem of milk costs displayed by the metropolitan friend of the pee-pul is of the usual grade dispensed by city papers when they attempt to discuss agricultural questions. One of the wonders of modern journalism is the glib way some editors talk authoritatively on any and all questions.

We make no defense for the indicted officials because we know nothing of the legal aspects of the contract that brought about their indictment, but we do protest the attempt to discredit the efforts of the dairy interests to organize so as to more efficiently handle their products.

Agricultural interests are as much concerned in effecting an organization to protect and make profitable their business as any branch of industry and yet the same papers crying loudest for the scalp of organized producers are afraid to protest organized effort in certain other fields.

A sample of the logic displayed by the paper making the attack on the producers is indicated by the statement that rather than cut the delivered price of milk last year the surplus milk was skimmed and the skim milk poured in the sewer and that the fat was turned into high priced butter, but that this year through more "efficient" (the quotations are theirs) methods introduced by the Milk Producers' Association a skim milk and cheese factory has been built and that now surplus milk is skimmed, the fat churned and the skim milk made into skim milk cheese!

There is slight excuse for pouring skim milk into the sewer—and the very fact that the association has worked out an efficient plan of handling the surplus is sufficient excuse for their organization and but indicates the effective work they are doing. The charge that this surplus should go to the babies, through cheaper channels, rather than be diverted and manufactured into butter and cheese shows how little the white-robed defender of the down-trodden consumer understands the questions it so trenchantly discusses.

At the prevailing price of milk there is no excessive profit to the producer —if the surplus was sold at a lower price than the bulk of the supply, a uniformly lower price would have to be established for the entire supply—a condition welcomed by the consumer, no doubt, but disastrous to the producer, whereas, by efficiently handling the surplus the price can be held up to a point where the producer can remain in business. All that dairymen ask is a fair profit—all would welcome cheap milk—but with labor and feed costs where they are, the bald fact is that they must have a living price for their milk.

The Six Great Conventions at Riverside

Editorial Correspondence

THE last convention to be held under the auspices of the state horticultural commission ended at Riverside last week. These conventions have been held for many years, the first under direction of the state board of horticulture, of which Elwood Cooper was president, later under the state horticultural commission, of which Mr. Cooper was also the first commissioner, and it now has ended at Riverside under the administration of Geo. H. Hecke, whose services as state horticultural commissioner will end as soon as the new law creating the office of director of agriculture becomes effective. This law, passed by the recent legislature and just signed by Governor Stephens, will place many of the matters having to do with agriculture under one head. The former state board of agriculture, which is practically the state fair association, is continued, and some other agricultural activities will be independent of the new organization. It is generally understood that former Horticultural Commissioner Hecke will be made director of agriculture. Other conventions of fruit growers and farmers will be held under a different name and having much larger scope.

This last convention was in many ways the most successful ever held in the state. The attendance from different sections of the state, and from other states, even other nations, was many times over that of any preceding convention. The attendance from Riverside County, as is always the case in the sections where these conventions are held, was limited. Some of America's brightest men connected with investigation or extension of present day knowledge were present at this convention, and California's practical every-day producers should have taken advantage of the occasion more than they did.

Writing the Magna Charta of Pacific Coast Quarantine

Members of committee of Western Plant Protective Board from left to right: Frederick Maskew, in charge of California quarantine; M. L. Dean, Olympia, Washington; C. A. Park, Salem, Oregon; W. H. Lyne, Vancouver, B. C.; H. C. Hagan, Salt Lake City, Utah; W. H. Wicks, Boise, Idaho.

The convention was called to order by Commissioner Hecke, and words of cordial welcome were spoken by Horace Porter, mayor of Riverside, also by Harry L. Boardman, secretary of the Riverside chamber of commerce. Mayor Porter showed himself a genuine lover of things agricultural, also that he had searched the volumes of other days for information as to what agriculture is and how it is conducted. We make on cover of this issue liberal quotation from portion of his address.

Responsible for Many Deaths

Inspector and chemical spray people largely make above group. Reading from reader's left to right: D. E. Luther, of California Spray-Chemical Co.; Donald Penny, Santa Cruz; H. E. Woodworth, San Mateo; M. G. Buhn, Kern; W. H. Volck, California Spray-Chemical Co.; the man with the smile, W. C. Jacobsen, state superintendent of rodent control; W. B. Bell, biological survey, Washington; C. E. Cook, Indio date grower; W. S. England; Bruce Drummond, in charge of government date experiment station, Indio; and A. J. Shamblin.

Mostly Nurserymen

From left:Geo. C. Roeding, M. R. Jackson, A. J. Elmer, Leonard Coates, H. A. Elmer, John S. Armstrong, R. M. Teague, W. R. Wood, Wm. T. Kirkman, J. R. Milligan, Robert J. Baird, J. D. Merriwether, Henry Kruckeberg, Max J. Crow.

The next place of meeting was not discussed in convention as the choosing of the place of meeting is entirely in the hands of the state commissioner. The commissioner announced, however, that it would probably be held in Chico, Butte County, as that city had extended invitation and agreed to give royal welcome if the next spring meeting might be held there. Neither is the time of meeting announced though it is understood that it will be held the coming fall.

The one thought most prominent in the entire convention, it having consideration in every day's discussions, was cooperation, especially with reference to marketing. All of California's cooperative associations had representatives present and had opportunity to present their methods of work, and the strangest part of it is that the methods of the organizations are so entirely diverse, to fit the needs of the various associations, that one cannot help but ask how can these organizations succeed while following methods so absolutely at variance with each other.

It was a convention of young men, and at every gathering of the older members, or those who have attended conventions for the past score of years, the remark was made; "Where

(Continued on Page 778.)

Mostly Bug Hunters

These men are mostly horticultural commissioners. Reading from left to right: F. C. Stokes, Lake County; A. A. Brock, Ventura; F. C. Brosius, Sacramento; Harry Stabler, Sutter; H. H. Ladd, San Joaquin; D. D. Sharp, Riverside; G. H. Hecke, state horticultural commissioner; Wm. Gould, Yolo; E. E. Dutton, Mendocino; C. H. Vary, quarantine; O. E. Bremner, Sonoma; F. W. Waite, Imperial.

Interested In Truck Crops and Things

From readers left: R. G. Risser; F. B. Renard, California Vegetable Union; W. H. Volck; H. L. Musser; M. L. Germain; State Deputy Horticultural Commissioner Weldon; R. C. Wiley, Santa Barbara; Dr. J. T. Barrett, in charge of Southern California Citrus Experiment Station; E. E. Kauffman, United States bureau of crop estimates.

Cletrac
TANK-TYPE TRACTOR

The logical successor to the horse and mule

MR. F. H. JOHNSON of New Augusta, Ind., reports that last July he used the Cletrac in loading hay and got in the crop from 140 acres at the rate of about 35 tons a day. "Besides getting the hay into the barn in such good time," says Mr. Johnson, "I made a substantial saving by not having to work my draft stock on this hot, horse-killing job."

Just another example of Cletrac adaptability and efficiency—just another case of doing *more* work *more* days in the year with the Cletrac.

The Cletrac tank-type tractor is versatile and extremely rugged.

It is small enough to be used economically on light jobs, yet powerful enough to handle the majority of the so-called *heavy* work about the farm.

It plows, harrows, plants, reaps, binds, threshes, hauls, cuts ensilage, fills silos, saws wood, and does practically all the work done by animal and stationary engine power.

It is the logical successor to the horse and mule. It is more efficient and does not only *more* work but *better* and *cheaper* work.

The tank-type construction of the Cletrac enables it to operate over soft ground where other machines would wallow and "dig themselves in"—an invaluable asset in the preparation of the seed bed.

It will go practically anywhere—*and does not pack down the soil.*

Orders are being filled in the sequence in which they are received. Place your order now—in time for Summer work. Write today for catalog and name of nearest Cletrac dealer.

The Cleveland Tractor Co.

19077 Euclid Avenue Cleveland, Ohio

Largest producer of tank-type tractors in the world

Mr. C. F. Balaam, Manager of the Copa De Oro Groves, Exeter, Calif., writes under date of May 24th, 1919:

"We use our Cleveland Tractor principally for cultivation and furrowing out in our orange groves at Naranjo, and find it specially handy where we have short turns to make, or complicated vineyard rows to handle. This is certainly an ideal machine for the forty-acre man to have, as he can do all his work with this machine, without the need of any team on the ranch."

See nearest "Cletrac" Tank Type Tractor dealer. Name on request.

Citrus Blast---What It Is and How It Works

By Robert W. Hodgson

CITRUS blast has been particularly active during the past spring in Northern California orchards. Reports would indicate that more damage has been done this season than ever before. Orchardists are beginning to be alarmed at the inroads of this new disease, many having never noted its activity until the present season.

Discovery

In the summer of 1912 the writer was engaged in top working some old seedling orange trees situated about six miles southwest of Oroville. In doing this work he had occasion to cut bud wood in an adjoining orchard and while examining the trees observed an apparently new and peculiar canker or lesion on the interior sucker growth. At the time this was given little more than a casual examination. Later in the season this peculiar abnormal condition was found in several places on the other side of the Feather River in Thermalito Colony some eight miles away and it was realized that here was something new and of possible economic importance. Accordingly an attempt to identify the disease was made by the writer, but without success.

As this canker did not spread to any appreciable extent during the next two seasons, due as we now know to unfavorable weather conditions and the actual damage appeared to be slight, no further attention was given to the matter. It was known to exist but apparently was of little importance. On several occasions material was sent for examination to the agricultural experiment station at Berkeley.

On returning to Oroville in May, 1915, the writer was immediately struck by the widespread occurrence of a condition ascribed to a late frost by some growers and characterized by others, where no frost could have occurred, as a "heavy leaf drop." On examination this condition was found to be due to neither of these causes but was apparently the result of the same disease which had been first noticed three years before. The same peculiar canker was prevalent throughout the mature trees on the newer growth. During the remainder of the season the disease was studied, notes were taken as to its occurrence and external manifestations and material was collected for laboratory examination.

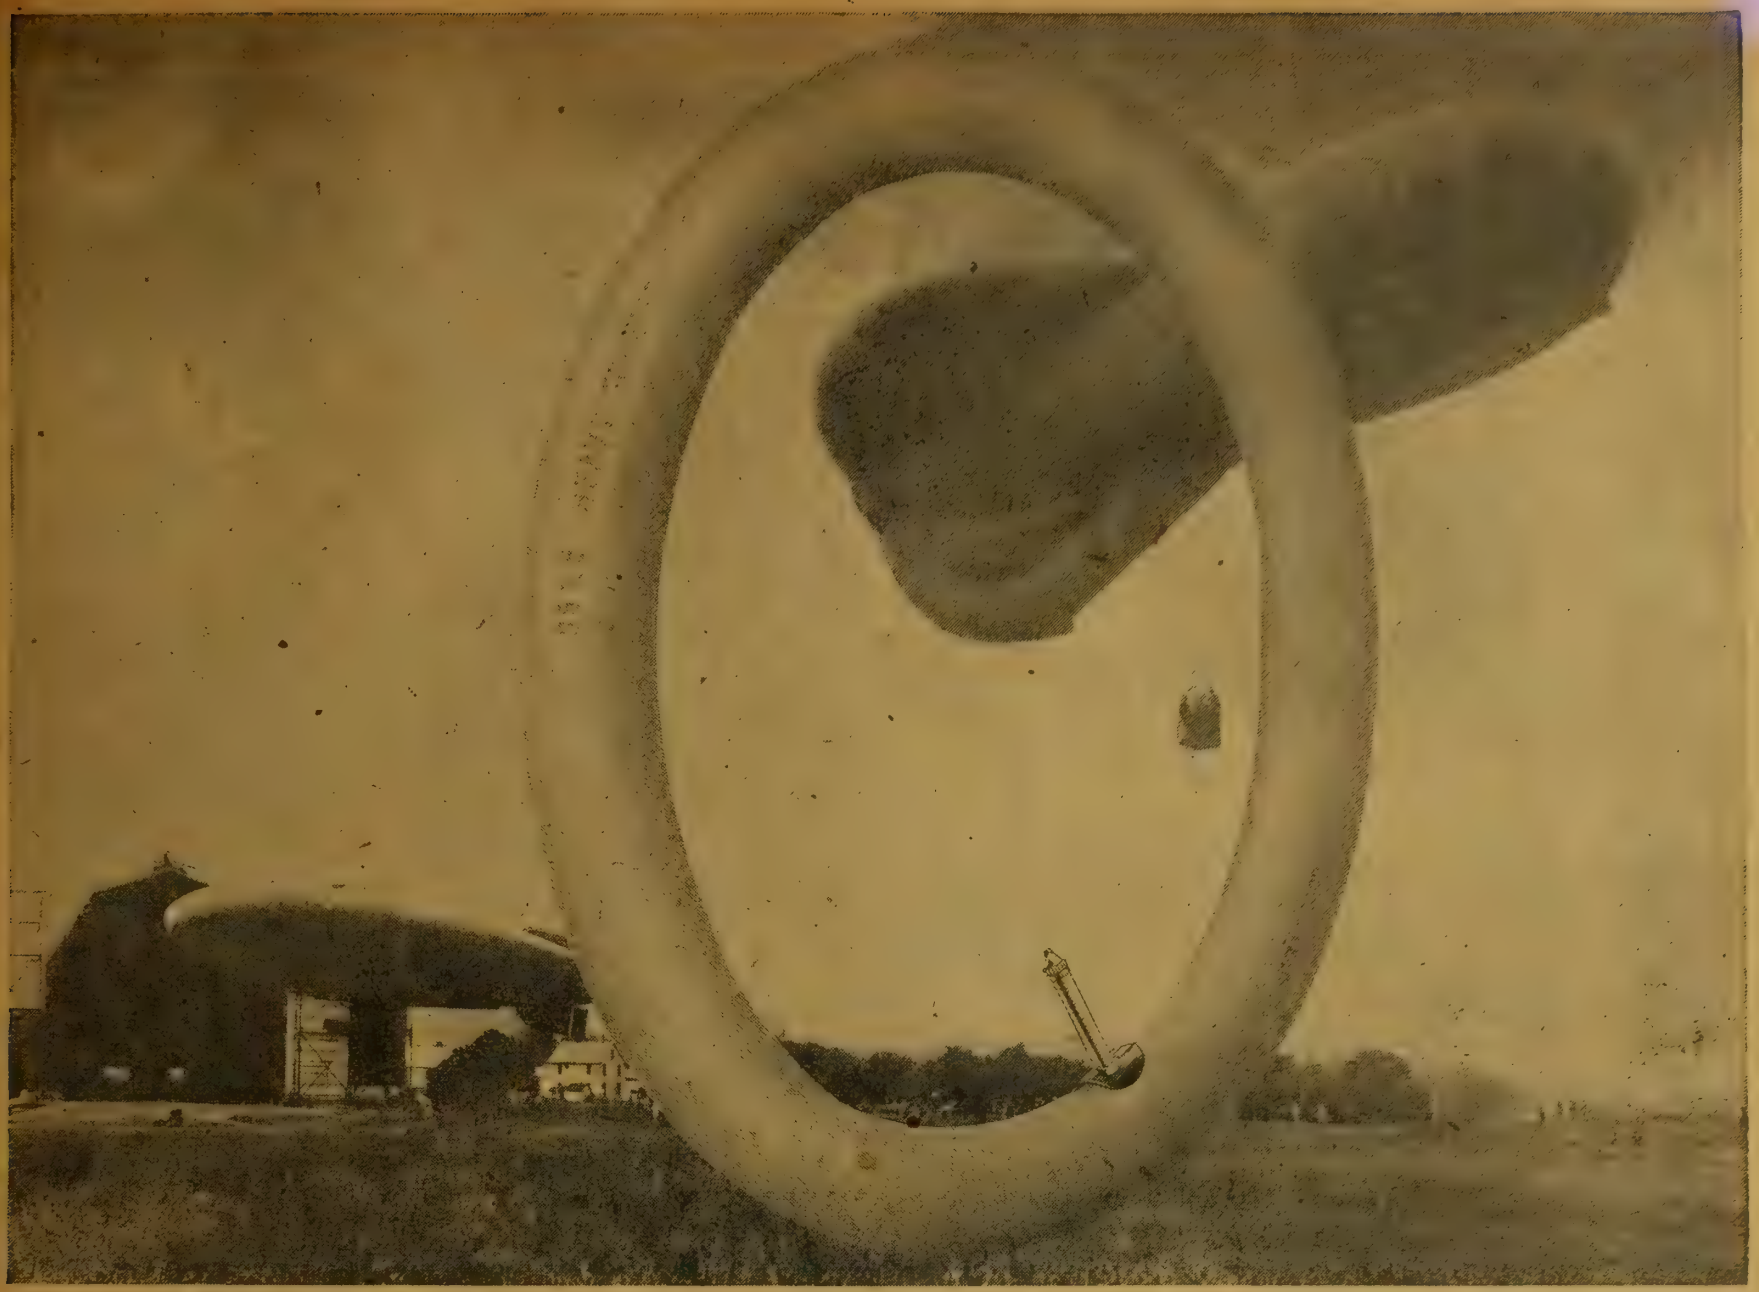
In 1916, although found quite generally throughout Sacramento Valley citrus plantings, the activity of citrus blast was such as to cause no particular concern. In 1917 in early spring the writer made a cursory survey of the distribution of the disease and found it very bad in the Oroville section as well as in the neighborhood of Corning and Orland. In 1918 it apparently was not very active as few reports of anxiety regarding its spread came in from growers.

Orchard Showing Citrus Blast

Affected orchard showing resemblance to pear blight. Notice the dead leaves still hanging on the trees.

Causal Organism

From the time of the discovery of the disease all the indications pointed to a bacterial causal organism. In fact the resemblance in its effects to pear blight is very striking. H. A. Lee, formerly of the University of California, and now of the bureau of plant industry at Washington, working on this disease at the instance of Dr. J. E. Coit and using material sent in from various parts of the state, in 1916 succeeded in isolating the causal organism, a bacterium which he calls Bacterium citrarefaciens. He found that the bacteria exist chiefly in the parenchyma tissue, destroying the cell structure, and that they do not ordinarily invade the vascular tissues. He further succeeded in isolating the bacteria from material which spent the summer in a dried condition, establishing the fact that the disease may exist over the summer in the dead wood.



Affected Twigs

Showing the characteristic lesions or cankers produced at the base of infected leaves. Courtesy division of plant pathology.

Disease Characteristics

Infection is apparently confined to new spring growth and seems to occur chiefly at the junction of the petiole and blade of the leaf. However, it appears that infection may also occur at the tips of the very young leaves

(Continued on Page 778.)

Built-Up *Layer-Upon-Layer*

JUST how important is the *layer-upon-layer* construction which Goodyear employs in the manufacture of tubes?

Does it make them stronger—longer-lived—better containers of air?

Well, for nine years we have been building balloons and dirigibles, in the construction of which our first and most complex problem was that of inflation. For gas is volatile, much more elusive than air, harder to capture and hold.

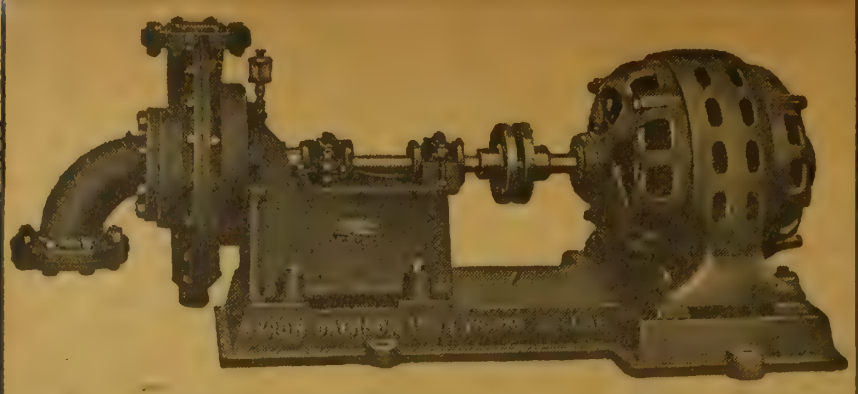
It was finally demonstrated, however, that rubberized fabrics, built up *layer-upon-layer*, formed the most practical container for this gas.

Once this fact was established, it seemed quite logical that the same principle should prove even more successful when applied to tubes. For a tube's sole function is to hold air.

We thus evolved the Goodyear Heavy Tourist Tube, making it of pure gum strips, building them up, *layer-upon-layer*, then curing them together, after which the valve-patch was vulcanized in.

The soundness of this method was immediately established.

The thin layers of rubber cured one upon the other enabled the elimination of all defects, such as sand holes and porousness. This construction also gave the body of the tube a criss-cross grain which prevented splitting if punctured. Finally, by vulcanizing the valve-patch securely into the tube we prevented all leaks at this source.



There is an observable tendency among motorists everywhere to use Goodyear Heavy Tourist Tubes exclusively.

They have learned that the slightly added cost of these thick, grey tubes is more than justified by their longer life and by the protection which they undeniably give to casings.

More Goodyear Tubes are used than any other kind.

CITRUS BLAST

(Continued from Page 776.)

and tender shoots. Once established, the disease progresses rapidly down the shoot toward the older wood. The newer and more tender growth is more susceptible to the disease, the older limbs apparently possessing greater resistance. The young shoots are often killed back to the older wood, including a portion of the bark about the base of the infected shoot. At these points the characteristic cankers are formed. It is not unusual to find a branch several feet long with every node affected in this manner. Upon infection the leaf turns pale yellow, then darkens irregularly in spots and wilts in places, where it later shrivels and dries, still hanging to the shoot. If the disease is virulent and conditions favorable, it may attack small branches of the previous season's growth, killing them back to a distance of several feet. The dead area about the base of the infected leaf or shoot varies greatly in size and is ordinarily more or less irregular in shape, frequently extending some distance along the stem. In the case of younger growth, girdling is apt to occur and the shoot dies back to this point. The rapidity with which the disease spreads is remarkable and only a few days of the proper weather conditions are required for serious damage.

As the dry season approaches activity is retarded and in midsummer the disease is apparently quiescent. The wilted shoots and leaves shrivel and dry. At this season these may be attacked by a number of common saprophytic fungi, among which are the common withertip, cladosporium and gray mold. The line of separation between healthy and infected tissue becomes very clear cut and definite. Frequently in early summer a pinkish, resinous gum is exuded from the cankers. These, as well as all the dying or dead tissue, take on a characteristic dark color and are sunk below the surface of the healthy tissue. This dead wood as it dries becomes very hard and tough. The healing process begins and in the wounds callus material is developed which raises the dead tissue up in the form of scabs. These are sloughed off in the course of time, leaving very characteristic scars which may be visible for several years.

A peculiarity noted is that the infection frequently does not seem to penetrate the bark into the wood. Indeed, in some cases the cambium layer is not killed, which is evidenced by the formation of callus material in the center of the lesion as well as about the edges. Where trees containing a large amount of weak, twiggy, interior brush are badly attacked there is a peculiar result. The bark of the twigs rots away, leaving the tree full of dead white twigs which may persist and not decay for several years.

Later in the season the effects of the disease are masked by the new growth. To find it at this time one must examine these branches under three quarters of an inch in diameter for the presence of the cankers.

Climatic Factors Influence Activity

Normal winter conditions for the citrus districts of Northern California are cool weather with intermittent rains, followed by short, dry, clear spells. Under such conditions the disease is not very active. The rains usually cease in February or March and there ensues a hot, dry spring and summer. However, it frequently happens that the winter rains are prolonged and coincide with the early spring growth. Such conditions are ideal for the maximum activity of citrus blast. Leaving its quiescent state, the disease becomes very active and spreads with great rapidity through the orchards, following the direction of the prevailing winds. The appearance presented is that caused by a rapid blight or heavy frost.

Distribution

Citrus blast was reported at Oroville, Palermo, Wyandotte and Orland in 1914. Since that time it has apparently spread rapidly both north and south, having been reported as far south as Porterville.

Inasmuch as this disease first manifested its economic importance in 1915, at which time it was confined to two local areas, its spread must be considered very rapid and, as it is so new and little known to orchardists, it is quite possible that it may have a much wider distribution than is now suspected. As yet no report of this trouble has come from the Southern California citrus district.

Reduces Bearing Area

Citrus fruit is produced on wood of the current season's growth. This puts out in early spring, bearing the fruit buds which open in April. As has been stated above, under favorable moisture and temperature conditions this tender new growth may be very seriously attacked by citrus blast. Depending on the stage of growth in this new wood, the character of the damage varies. Attacks early the season may kill all this fruiting brush back to the old wood, but if weather conditions change it may be killed back only part way.

In the event that the first named condition occurs, new fruiting brush must be grown and this draws on the reserve food and strength of the tree. Blooming is delayed several weeks and the normal processes of nutrition in the tree so weakened and disturbed that the proportion of fruit "setting" may be reduced.

If the new wood is only killed back part way, a resprouting of the uninjured portion occurs which, while not delaying blooming so long, may have the same general effect as the damage in the previous case. In addition, this resprouting may result in an abnormal clustering of the flowers, which is not desirable.

It very frequently happens in northern citrus districts that the trees are in bloom when conditions occur which are favorable to the disease. Sometimes the flowers are attacked and killed, in which case no compensatory growth occurs. Thus, depending on the time of the attack, the blooming may be seriously reduced and the flowers may be killed, all of which reduces the crop to a greater or less extent.

Some agency should most certainly be at work investigating measures for controlling or eradicating this disease. It is of special urgency that adequate measures be taken to control it before it spreads to Southern California citrus orchards. We may expect, however, since the disease is caused by a bacterium that efficient control will be difficult. At the present time the practice most likely to succeed in controlling it would seem to be careful pruning out and burning of infected branches in early summer when the diseased areas are readily seen.

THE SIX GREAT CONVENTIONS

(Continued from Page 775.)

are the old-timers who used to follow the state conventions?" "Where are Hutchinson, Stephens, Blanchard, Maslin, Rogers, Walton, Craw, Cundiff, Markley, Tuohy, Fowler, Dore, and a score of others?" "Gone West, most of them," was the only reply. There were a few, however, of the old-time attendants. Amongst them were Messre. Rixford, Roeding, McKevitt, Ehrhorn, Stabler, Sprague, Read, Coates, Chase, and a few others, but as is shown in the photographs on this and other pages, the great mass of those attending was from the ranks of the younger fruit growers.

* * *

The resolutions committee consisted of Messrs. Geo. W. Pierce, F. B. McKevitt, B. D. Sharp, Carlyle Thorpe, Chas. B. Messenger. Mr. Thorpe was not present, however, when the final draft was completed. The resolutions are:

THE RESOLUTIONS

Whereas, there exists a vacancy on the Board of Regents of University of California be it

Resolved: that in the appointment to fill that vacancy we request Gov. Wm. D. Stephens to give serious consideration to the claims of agriculture.

We congratulate our Commissioner of Horticulture Geo. H. Hecke, for his able, impartial and efficient administration of the duties of his office and recognize the zeal and enthusiasm with which he has grappled many important and perplexing problems constantly arising in connection therewith.

The fruit growers of California in this convention assembled, hereby pledge to the commissioner of horti-

culture their loyal support in all measures intended for the betterment and advancement of our horticultural interests.

Whereas the State Association of Horticultural Commissioners and the California Association of Nurserymen in session this horticultural week, May 26—31, 1919, at Riverside, passed resolutions endorsing the Federal Horticultural Board, which is under direction of C. L. Marlatt, be it

Resolved: That we, the attendants at the fifty-first Fruit Growers and Farmers Convention, endorse the action of the above organizations and urge fullest support of the federal board by Congress and by all the agricultural interests of the country, and to that end we pledge our fullest support.

Whereas, our loyal friend and fellow worker, B. E. Hutchinson of Fowler has recently been called beyond, be it

Resolved: That this convention express its sympathy to the bereaved family. During Mr. Hutchinson's lifetime he was closely identified with horticulture, having shown great interest in conventions of the past. We will miss him from our ranks and with his many friends we will sorrow because of his decease.

To our visitors from the city of Washington, other countries, states and territories—welcome. We appreciate fully your help and the benefit which will come from our intercourse and from the ideas which you have brought us. Here's hoping for a safe trip home and for the future cooperation in advancement of mutual interests.

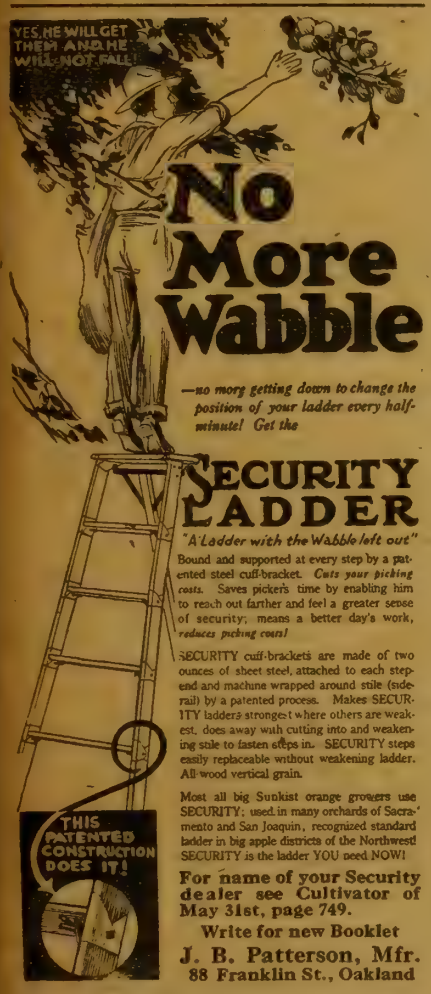
In recognition of the magnificent fight made by the federal authorities and authorities of the state of Florida

(Continued on Page 782.)

USE OF FROZEN FRUITS

(Continued from Page 773.)

product of brilliant color and fine flavor. We have used infusorial earth as a filtering medium and a flash sterilization above 85 degrees C. Juices have kept for six months without deposition or sediment or deterioration of flavor.



Other blends, with California grape juice, have been tried out but lack characteristic flavor. The Muscats probably do better than the others, but all blends were inferior to the first two mentioned. Eastern grape juice has not been tried, but there seems no reason why it would not blend well with grapefruit juice.

In conclusion, a word on the present status of the citrus by-product industry in California may not be amiss. The Citrus By-products Laboratory of the United States department of agriculture, at Los Angeles, maintains an exchange service through which it is aimed to place citrus by-product manufacturers in California and Florida in touch with consumers. Manufacturers of by-products are requested to list with the exchange service the products which they are manufacturing, and jobbing concerns are requested to make their wants along similar lines known. When requests are received from either producer or consumer, they are sent immediately to all parties interested, in the hope that the whole industry may be encouraged.

At the present time there are fourteen concerns listed as producing five main products. There are four concerns producing citric acid, one producing citrate of lime, seven producing peel in one form or another, five producing juice and three producing oil. It must be confessed that a number of the firms listed are not, as yet, sure of their ground and can hardly be classed as going commercial concerns. The by-product industry has undoubtedly, however, taken great strides in the past two or three years. Two of the citric acid plants are of very large capacity. Both could undoubtedly exceed 10,000 tons capacity per annum, if necessary. Indeed, with no very serious alterations, it would be possible to increase the capacity to 20,000 tons each. The third citric acid plant has a capacity of 2500 tons and the citrate of lime plant a capacity of 8000 tons or more. To what extent the two latter plants could extend their capacity, I am unable to state. A very conservative estimate of the entire capacity for handling lemons of the four plants as they stand today would be from 30 to 40 thousand tons.

Practically all of the oranges being absorbed for by-products at the present time are going into marmalade factories. One concern alone has a capacity of about 5000 tons of fruit and estimates of the other concerns now operating vary from another 5000 to 10,000 tons. Personally, I am of the opinion that the former figure is more nearly correct.

This state of affairs has also been reflected in the price of cull fruit during the past few years. Up until 1915-1916 it was not at all difficult to secure cull oranges and lemons at $5 per ton for sound culls. During the present season, when the crop conditions are possibly more nearly normal than at any time during the past two years, we are asked to pay from $20 to $30 a ton for material of the same grade. Whether these prices will continue in normal times, with normal competition from foreign products, and in seasons when the crops are abundant, is a matter of some doubt, but at the present time I do not hesitate to state that the by-product situation is extremely gratifying.

No More Wabble

—no more getting down to change the position of your ladder every half-minute! Get the

SECURITY LADDER

"A Ladder with the Wabble left out"

Bound and supported at every step by a patented steel cuff-bracket. *Cuts your picking costs.* Saves pickers time by enabling him to reach out farther and feel a greater sense of security; means a better day's work, *reduces picking costs!*

SECURITY cuff-brackets are made of two ounces of sheet steel, attached to each step-end and machine wrapped around stile (side-rail) by a patented process. Makes SECURITY ladders strongest where others are weakest, does away with cutting into and weakening stile to fasten steps in. SECURITY steps easily replaceable without weakening ladder. All wood vertical grain.

Most all big Sunkist orange growers use SECURITY; used in many orchards of Sacramento and San Joaquin, recognized standard ladder in big apple districts of the Northwest! SECURITY is the ladder YOU need NOW!

For name of your Security dealer see Cultivator of May 31st, page 749.

Four Row Bean Cultivator
For Tractor or Teams

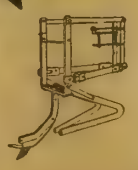
Killefer Quality

Conserve man power—One man cultivates four rows of beans as easily as two with this tool

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simple controlled cultivator, capable of doing their work deeper and better than possible with the lighter tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the four rows and the foot control is very easy on the driver. Built to cultivate any width row from 20 inches to 36 inches wide.

Write for Catalogue and book on deep tillage.

Specify Width Rows When Ordering



The Killefer Manufacturing Co.
2209-21 Santa Fe Ave. Los Angeles, Cal.

LIBERTY BEET TOPPER

BEETS PULLED AND TOPPED IN ONE OPERATION

The Liberty beet topper answers a long-felt demand.
It is simple to operate.
By test it tops better than hand topping.
Is efficient under all conditions of weather and soil.
Accurately tops high and low beets as well as large and small ones without clogging.
Attached to any riding beet digger or lifter, requires no extra horse power.
Can also be attached to riding cultivator and one, two, three or four rows topped at one time.
In saving more than a ton of beets per acre over hand topping, the Liberty Beet Topper pays for itself from approximately the first ten acres of topping.
Built of best materials; is durable; guaranteed against defect.
For information pertaining to demonstration inquire from W. M. Vance, 701 West 10th St., Los Angeles, Cal.
Send for our illustrated free booklet describing fully the merits of the Liberty Beet Topper. A card today will bring it.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

WE have been busy preparing and planting for several months now and each month we enjoy more and more the results of our labor which is part of the gardeners reward, then we gain also experience by observation and general practice. Now and again we have failures and if we discover the cause then such serve their purpose, as by them we learn lessons for the future, and it is all worth while. This month should find us as busy as any previous one. We have our successional sowings to make, watering to attend to and weeds to check, not forgetting to keep the wheel cultivator, that very useful labor saving device, at work, or the hoe.

Such useful fertilizers as soot or wood ashes may be applied to the onion bed and an increase in size will be noted in a few weeks. Weekly waterings with liquid manure will also prove of great value. The value of soot as a manure is very much underestimated. It contains besides potash, sulphate of ammonia, a very valuable element. Soot is usually applied fresh as a top dressing to the various crops at the rate of from fifteen to twenty bushels per acre and apart from the fact that it acts as a stimulant it is useful in preventing attacks of many garden pests. Wood ashes are more easily obtained by our readers and should be worked in the surface of the soil before planting the crop or may be used between the rows of existing crops. They are extremely valuable as a general manure and among the principal constituents are potash, lime and soda. They may also be mixed with poultry, horse and cow manure.

Spraying

Many people have an ida that vegetables need little attention in the matter of spraying, but aphis, black and green, are generally troublesome to peas, beans, tomatoes and potatoes, and it pays to use a solution of "Black Leaf 40" on these as soon as they are observed. For the squash bug, which is also troublesome to these plants and respects not even the cucumbers or melons, spray with lead arsenate or Paris green, which will be found effective against any of the leaf eating pests. Thrips and mite or red spider, are generally found on the underside of the leaves of beans, some localities being affected worse than others. Sulphur in liquid form is best to use as a spray with a strong spray pump. While we are not always in favor of looking for trouble it is safest to be on the alert as many a good crop has been ruined by pests while the grower has been asleep waiting for results. The demand for crop productions is too great to allow anything to be lost.

Peas

Most of the early varieties have been picked and the ground may be used for root crops which should follow such a leguminous crop and gain from the nitrogen in the soil. Sowings may still be made of varieties Little Marvel, American Wonder and Stratagem. The seeds should be soaked for a few hours previous to sowing and the rows irrigated a week after germination has taken place. Where wood ashes are obtainable apply a good dressing when preparing the ground.

Beets

Make a sowing, thinly in rows on deep rich soil, fifteen to eighteen inches apart of Crosby's Egyptian or Detroit Dark Red, both of excellent quality. For greens sow Swiss Chard, the Sea Kale beet variety Giant Lucullus. It can also be used for poultry and may be cut a number of times. The seedlings of these should be thinned to at least eight inches apart.

Squash, Cucumbers, Melons.

The bugs have been busy on these and some re-sowings may be necessary. Do this at once and spray as advised above as soon as the seedling has three or four leaves. The Winter Casaba Golden Beauty may still be sown. Draw the soil around the plants now getting established and water at least weekly.

Tomatoes

Watering once or twice during the month will help these establish themselves and cultivating around each plant will do the rest. Where they are to be grown on the trained system stakes should be given the plants for support as soon as they get a few inches high and the axil shoots removed. However, excellent crops are also obtained by allowing them to ramble along the ground when the growth is unrestricted.

Beans

Keep up the successional supply by sowing Stringless Green Pod, Golden Wax and Kentucky Wonder, the last named being a pole bean. Davis White Wax is a dwarf variety best as a shell bean and should also be sown. Tepary is similar to White Navy and should also be grown. It needs very little water. Keep the cultivator at work through the rows and conserve moisture.

Carrots

Sow French Forcing and Danver's Half Long to keep up a successional supply. They may be stored later for winter use. Carrots thive in rich but moderately moist soil. If too much water is given it causes them to split open.

Corn

Sow Black Mexican and Crosby's Early, both fine flavored varieties, and keep the ground well cultivated between the rows of those sown last month.

Lettuce

To keep a constant supply on hand sow May King, a variety which quickly matures, and Los Angeles. Those who prefer the Romaine type should sow White Paris Cos. Thin the seedlings to six or eight inches apart or only small heads will result, and water regularly.

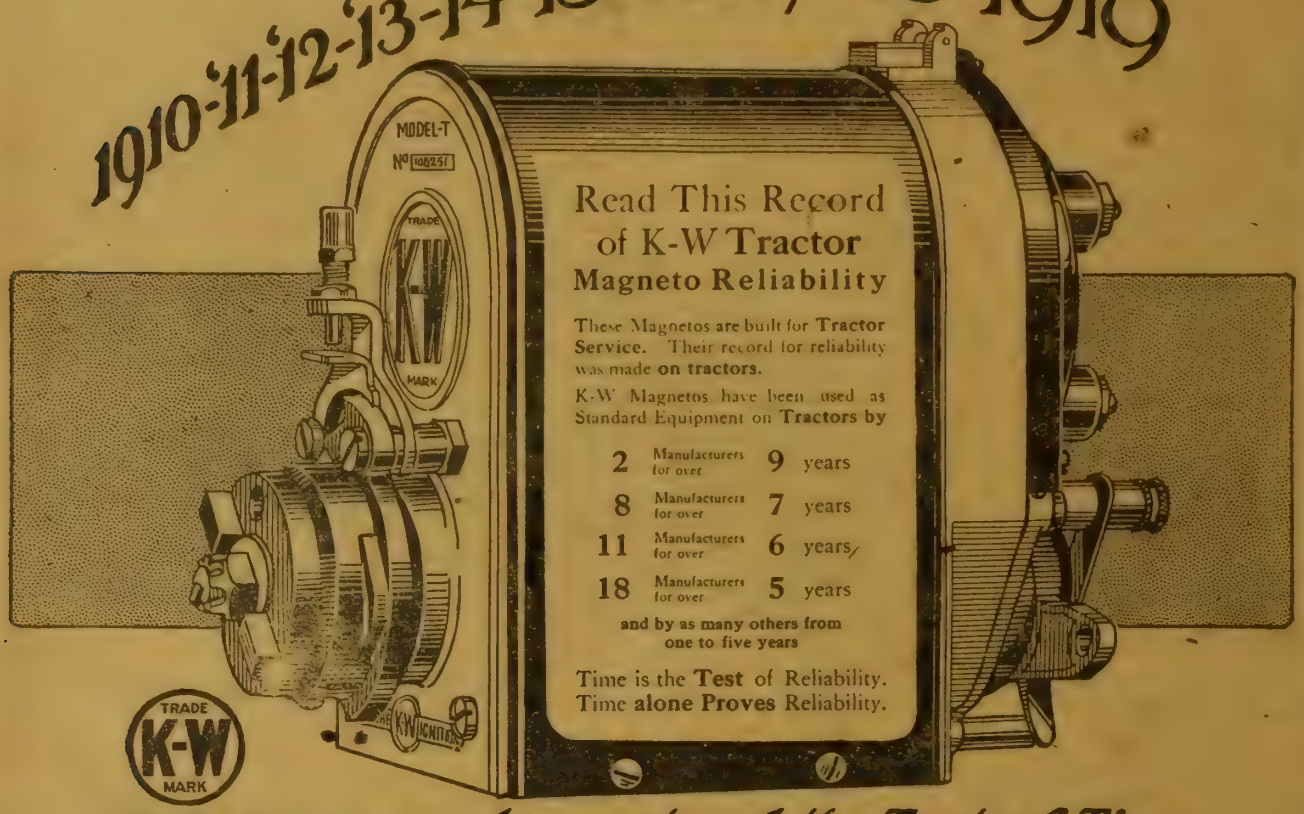
Parsnip

This little known vegetable should be more widely used as it is easily grown and thrives in a deep garden loam. Sow the variety, Hollow Crown, in rows 18 inches apart.

Leeks and Celery

Secure plants of these to plant in well prepared trenches richly manured. Golden Self Blanching and White Plume are good varieties of celery, and Giant Musselburg leek.

Southern California



By D. F. Reichard

THE early planted gardens are by this time furnishing fresh vegetables. The cool spring has not been altogether favorable for rapid growth of summer crops but has extended the growing period of the hardy vegetables.

Because the weather is getting warm and the hills are getting brown is no reason for stopping your garden. Soak the ground thoroughly where matured crops have been taken out and work it over in preparation for summer growing stuff.

Plant squashes; June is the best month to put in the winter varieties. Pikes Peak and Banana or Fence Post squash are good keepers and sweeter than the ever popular Hubbard. Of the green squashes the Early White Bush is almost universally used, but those who will plant the Fordhook will find something sweeter and finer of grain.

Plant Prickling and Davis Perfect cucumbers. These will be ready to use in seven or eight weeks. Put in watermelons, muskmelons and casabas

High Tension MAGNETOS — *have stood the Test of Time on TRACTORS*

Back in the early days when big tractors pulling large gangs of plows first broke prairie soil and the tractor manufacturers yearly took part in competitive plowing contests, two tractor manufacturers adopted K-W Magnetos as standard equipment. Then year after year other manufacturers, recognizing the importance of "Reliable" ignition came to K-W for Magnetos.

These K-W Magnetos have stood the gaff of tractor service in every state in the union and in fifty-seven foreign countries. They have done their work year after year in all climates from torrid Africa to frigid Russia. They have worked in rain storms, snow storms and sand storms. They have made good in every drawbar and belt service under every conceivable working condition. Because they have stood the test of time they are recognized today as the standard magneto for tractors the world over.

The K-W Magneto has been developed by keeping in close touch with tractor development and an accurate knowledge of the conditions under which a tractor must operate. It owes its reliability to the patented K-W construction and the fact that K-W Magnetos have always been made up to a quality and never down to a price.

K-W "Inductor" design eliminates all internal sparking and trouble due to sliding contacts and poor connections, because in K-W construction all internal connections are **permanent.** There are no moving wires, revolving windings, troublesome commutators and brushes, current collector rings, etc.

And K-W Magnetos are just as efficient as they are reliable—they cut fuel bills to the bone. Make sure the tractor you buy is K-W equipped. Look for the K-W trade mark—the symbol of Reliability. Write for a list of K-W equipped tractors.

THE K-W IGNITION Co.
2895 CHESTER AVE. CLEVELAND, OHIO. U.S.A.

TRADE K-W MARK **High Tension MAGNETOS** Fire Any Kind of Fuel and Get Maximum Power Out of Every Drop Used

if your garden is large enough. Plant these vining plants on the edge of wide furrows and train the vines away from them so that the plants may be irrigated and cultivated without disturbing the runners. It is perfectly safe to put in sweet corn and field corn, sorghum and kaffir.

String beans in variety and field beans will do very well planted in June. Pepper, egg plant and late tomato plants will give good results. Carrots, beets, radishes, lettuce, green onions can all be planted.

Anything planted at this season will require more water than the soil ordinarily supplies, therefore the ground should be well soaked before it is worked and planted. Seed put in at this time should be in the damp earth one to two inches even though there is that much dry dirt on top of that. This may seem rather deep but it is necessary during the warm drying weather to keep the seed and young seedlings from drying out before they are large enough to irrigate.

In setting out plants be sure to always pour a pint or so of water at the roots of each plant, or if setting in a field make a furrow, set the plants, then turn water down the furrow, go back and straighten up any of the plants that have fallen. Work the dirt in around the plants and in about two weeks give them another wetting at least four inches from the plant.

When water is needed in the garden apply it by running furrows beside the rows and allow the water to run through slowly. Cultivate as soon as the soil breaks up nicely without sticking to your tools.

Where the plants are backward apply a small quantity of commercial fertilizer to each plant, working it into the soil. At the first appearance of insects or disease apply the proper remedy. For aphis and thrips spray with Black Leaf 40; for chewing insects use an arsenic poison; for wilt, mildew and rust use Bordeaux mixture; for red spider, dust with sulphur.

This Month in the Ornamental Garden

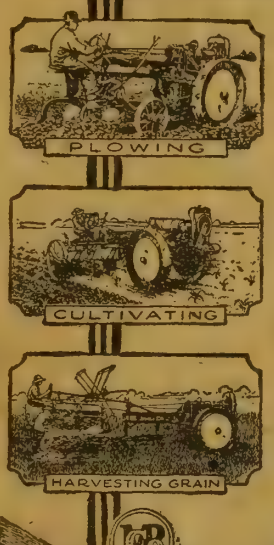
Northern California

By Albert R. Gould

MOST of the replanting and moving of trees and shrubs ere this have been completed for the season, as it is not advisable to take chances with large or even small specimens during the coming hot weather. We have now to devote our time to holding the new plants and getting them established. Of course, it is still possible to plant smaller stock generally grown and sold by nurserymen in small pots as the shock of planting out from the pots is not great, and with this purpose in view many enterprising nurserymen have roses and other subjects on hand in pots ready for the call at all times and for replacement during the season.

Mulching

This is most important, and all newly planted subjects should be mulched with leaves, farmyard manure or some such suitable material; it will help get these established and save watering so often. It will be more than ever necessary this and the following months. The roses, both dwarf and climbing, need it; trees and shrubs of all kinds may be so treated.



Lawns

These should never be neglected in regard to watering, and the best time to apply the sprinkler is immediately after the grass has been cut. This will encourage thick bottom growth and prevent burning from the sun. Newly planted lawns should not be allowed to get dry at any stage, and it is a good plan to sprinkle these every other day until the young grass has become established. As soon as the grass is firm enough to work on, all weeds should be removed, and if this is taken in hand while they are small lots of trouble in the future will be avoided. No matter how careful you may be there will always be a few weeds in the soil, coming as they do from the weed seeds previously distributed. Some people often blame the grass seed, but the reliable seeds-

Moline System of Power Farming

MOLINE UNIVERSAL TRACTOR

By using the Moline-Universal Tractor and Moline Tractor implements, you can farm more land, better, easier and at less expense than you ever did before. Farmers in all parts of the country are now making more money through the use of the Moline-Universal Tractor and Moline Tractor Implements. Unsolicited testimony from owners is the best proof of satisfactory performance. Read the following expressions from Moline owners:

"The Moline-Universal has done for me what two men and twelve horses would have done at less expense than one man and six horses." Jesse L. Bonsall, Scotia, Nebr.

"It saved me the price of seven horses. It has created a greater desire for farming." Arthur Weil, Reddick, Ill.

"I have been able to dispense with two men and some hired help in the house because of the Moline-Universal Tractor." Wm. P. Johnson, Lovington, Ill.

"It has saved me hiring one man and keeping five extra horses." Henry Hilbert, Charlotte, Ia.

"Earned me $1,700 in 60 days and established me in a good paying business." C. J. Hawley, Seargent Bluff, Ia.

"I accomplished about three times as much as I would had I not had the Moline-Universal. For me to go back to horse power would be the same as doing without my automobile." F. N. Miller, Marysville, Mo.

"It has spoiled me because I do not care about driving horses any more." S. R. Moben, Westphalia, Kans.

"A big time saver and makes hard work a pleasure." Millard Belt, Rockville, Md.

"It has accomplished just 100 per cent more than I expected it. As a hill climber there is no equal." O. H. Barkledge, Washington, Mo.

"I can't work horses any more as I do my work so much easier with the Moline-Universal." Henry Shatz, Sheridan, Ore.

"During my ownership of the Moline-Universal Tractor my farm work has been made more pleasant and profitable." S. M. Pinckney, College Farm, Orangeburg, S. C.

"My wife and I have farmed this year by ourselves—something we never did before." H. E. Hartzell, New Weston, Ohio.

"It has saved me $600 in labor this season." Ira Brinkman, Shades, Ind.

If space would permit we could fill up this entire paper with letters from satisfied owners of Moline-Universal Tractors. Write for full information and large list of farmers who are making more money with less hard work by farming the Moline way.

men have spared no expense to clean their seed and send it out pure. While it is not advisable to plant large areas of lawn at this time, but better to wait until the fall or early spring, bare spots may be covered and small areas sown if covering such as sand or straw is used to shade it. We have found beach sand very satisfactory as a shade cover but it must not be applied too thick. Old lawns should be given a dressing of nitrate of soda, dried blood or sulphate of ammonia to stimulate them for the season. These are all quick acting and only a light sprinkling should be given.

Begonias

For shady situations these are ideal plants and there are now quite a variety of both the tuberous and fibrous rooted types. Of the former, the hanging basket variety, pendulent, to be correct, is especially useful and comes in a range of colors. They are just now getting popular and plants placed in a wire basket filled with soil composed of leaf mould, the bottom of the basket being lined with moss, look very effective, especially if the drooping type of lobelia is used with them. Other varieties of the tuberous type are useful grown as house plants or planted under trees. Started tubers of these may generally be secured from your seedsman and they may be kept from year to year if stored during the winter in dry sand. The fibrous rooted varieties and species are numerous. These are especially suitable for bedding planted in masses, and may be left in the ground from year to year.

Sweet Peas

Many desire a succession of bloom for the fall, and we would advise sowing the following to be planted at once in well prepared trenches: Royal Purple, Margaret Atlee, cream pink, Helen Lewis, orange, Geo. Herbert, lavender. For winter flowering sow Early Morning Star, Early Melody and Early Snowflake at the end of the month.

Annuals

Those sown last month will soon be ready to transplant to other beds, and in a few weeks some may be planted out to their flowering quarters. For fall use marigolds, African and French types, calendula, calliopsis, larkspur, Emperor Branching. Nemesia and stocks may still be sown. Cosmos, asters and tithonia speciosa, the orange flower from Mexico which lasts so long in the fall, may all be planted out now, and the last named should be spaced at least three feet apart. Mulch with lawn clippings or old rotted manure.

Dahlias

These should be well started this month and stakes may be put to each plant for support, and as the plants make progress the shoots should be tied in. Water these liberally. Seedlings will require transplanting from the seed bed or box to other quarters. Transplant three to four inches apart in fairly good soil and place in the shade for a few days. In three to four weeks they may be planted in their flowering quarters.

Southern California

The weather which has been given this season has permitted some little neglect, and still the flowers have been large and all growth has been luxurious. Foggy mornings have been the rule in all near-coast sections, and interior valleys have escaped drying winds and extreme heats. June will bring warmer sunshine and there must be closer attention to irrigation. Don't sprinkle the surface of the soil but irrigate deeply and thoroughly. Also in wetting the lawn give more copious irrigation than most lawns have secured during the recent weeks.

Dahlias and some of the later bloomers are sending up strong, thrifty stalks, which will need tying to stakes. It is rather late for planting gladiolus or other summer blooming bulbs, but any which are still out of the soil should be planted at once and will give late bloom and still mature their bulbs if given careful attention. Iris, which have been blooming profusely during the last month, are now approaching their rest period, and water may be withheld somewhat, especially later in the month. They should be allowed to ripen the newly formed rhizomes so that they will be ready for replanting in August or September. One may still divide cannas, although it should be done early in the month, and best of care be given to push them along to their wealth of bloom in later summer.

Presumably chrysanthemums have been divided and rooted and slips are ready for setting in open ground. However, the later bloomers may still be divided and planted. One may still plant seed of Shirley poppies and others of the hardy annuals, in fact, these may be planted at almost any time of the year. Sweet peas are now in their glory, and plenty of water, with a bit of quick-acting fertilizer, increases size and abundance of bloom. This bloom may be continued if the cutting of blossoms is persisted in. If the flowers are allowed to remain and the strength of the plant is allowed to go into seed the bloom will be greatly reduced.

Roses should receive some attention, though their glory is largely gone for this season, especially if the old, wilted flowers are allowed to remain and mature seed. Cut all this departed bloom off and reduce the dried and yellowing leaves.

Keep down the aphis and all garden pests if best of flowers are desired. In addition make free use of sulphur. It keeps down mildews, red spider and other pests.

THE SIX GREAT CONVENTIONS

(Continued from Page 779.)

upon the pest of citrus canker, be it

Resolved: That we, in attendance at the fifty-first State Fruit Growers and Farmers Convention at Riverside, May 29, 1919, express our admiration and appreciation and hope that the campaign will result in complete eradication of the pest and the saving of the citrus industry of that state.

Whereas, the fifty-first Fruit Growers and Farmers Convention of California, now closing its sessions in the

From All Quarters of the Globe

Standing, from reader's left: W. H. Wicks, Idaho; O. A. Pratt, Mexico; Geo. P. Weldon, state deputy horticultural commissioner; A. Pellegren, Mexico, who, with Mr. Pratt, represented the state of Lower California and its President Cantu; C. H. Vary, state quarantine, Los Angeles; Geo. M. List, Colorado; Harry S. Smith, state insectary; W. A. Jacobsen, California rodent control; H. M. Armitage, Southern California insectary; O. W. Newman, northern field deputy; Harold Hagan, Utah quarantine officer; S. C. Mason, bureau of plant introduction, United States department of agriculture; Dean Thos. F. Hunt, University of California; and the last man, who almost escaped the camera, is Andrew Kimball, Arizona plant board. Seated, left to right: D. B. Mackie, state deputy commissioner; M. B. McKay, potato specialist, Corvallis, Oregon; E. M. Ehrhorn, entomology, Hawaii; A. L. Strauze, state horticulturist, Montana; M. L. Dean, quarantine official, Olympia, Washington; Frederick W. Maskew California state quarantine.

city of Riverside, has afforded opportunity for every attendant to secure great benefit amidst surroundings of comfort and pleasure and these comforts have been greatly enhanced by the work of the Chamber of Commerce, the city government and the people of Riverside. Therefore be it

Resolved: That we express to Frank Miller and the management of the Mission Inn the fullest appreciation for the use, even to the ownership, of the Inn, during the entire week. No keys were turned over to us but the Inn became our home with all doors wide open. In addition we express our appreciation for the special efforts put forth in our behalf by the Chamber of Commerce and the city government. We further express appreciation to the press which has so fully reported transactions and news of the convention to the end that valuable information has the quicker reached and benefited agricultural interests.

Another resolution was passed in which it was urged that if any action is to be taken on the recommendation of President Wilson that the prohibition war measure, which will go into effect on July 1, should be annulled, that such action should be taken quickly in order to allow vineyardists to make plans accordingly.

NURSERYMEN'S ANNUAL

THE keynote of the Annual Convention of the California Association of Nurserymen was "Closer Cooperation with each other and with horticultural commissions and inspectors." In turn the commissioners were free in expressing their desire for closer cooperation and even affiliation to the end that California horticulture may be advanced.

Another advanced step taken resulted in appointment of a committee which shall devise method and establish rules as to standardization of nursery products, at least of deciduous nursery trees. This committee consists of Messrs. Gandier, Shamel, Roeding, Coates and Coolidge.

The work more particularly of the committee has to do with settling one point over which some nurserymen have been unable to agree, that is as to height and caliper standardization. Some contend for one plan, some for the other. The caliper folks maintain that by planting very thickly and growing tall spindling trees a "3-4" or a "4-6" foot tree is much more cheaply grown but that it has not the future possibilities of a tree of large caliper.

The committee has some job, but the nurserymen are bound to work harmoniously.

The officers elected for the next year are: President, Wm. Kirkman, Fresno; vice presidents, M. R. Jackson, Fresno; A. L. Wisker, Grass Valley; Charles W. Ward, Eureka; D. W. Coolidge, Pasadena; and Edward H. Rust, South Pasadena; secretary and treasurer, Henry W. Kruckeberg, Los Angeles; executive committee, George L. Otto, San Diego; W. P. Clarke, San Jose; J. D. Meriwether, Gilroy; C. W. Gandy, Modesto.

The decision as to the next meeting place of the convention, after considerable discussion, was left in the hands of the executive committee. Invitations from Modesto and Fresno were communicated to the members of the association. It is probable that a meeting will be held next fall.

Ladies Auxiliary.

Much pleasure has been added to the gatherings of the California Association of Nurserymen by the organization some three years ago of the ladies auxiliary. The membership of this organization is made up largely of families of the nurserymen. It has blocked out for itself no particular line of effort along nursery lines but has afforded opportunity for activities for the ladies during convention week. At the Riverside convention officers were elected for the coming year and other business transacted. The officers are: President, Mrs. John Valance; first vice-president, Mrs. J. S. Armstrong; second vice-president, Mrs. H. Plath; secretary, Mrs. Max J. Crow; treasurer, Mrs. Chas. Jackson. The executive committee consists of Mrs. Wheeler, Mrs. Bennett and Mrs. Hills. The membership now totals about fifty.

In regard to the federal quarantine the nurserymen were emphatic in support of the country's fruit interests. Here are

The Resolutions

The California Association of Nurserymen, representing in its membership about 70 per cent of the total annual volume of nursery products in the state, in convention assembled in Riverside May 27-28, 1919, begs leave to call attention to the following facts:

The annual production of economic and ornamental plants in California aggregates about four millions of dollars, and the total investment in land and improvements totals something like ten millions of dollars.

Fruit growing and commercial plant growing has reached a higher development and a greater exploitation in this state than in any other American commonwealth, representing an annual turn over of about one hundred and seventy-five millions of dollars, covering a wide diversity of orchard and vineyard products, of plants and flowers, than is enjoyed by scarcely any similar geographical area.

In the development and prosecution of this industry plants from all portions of the world have been drawn on, resulting in the introduction of many species and varieties of injurious insects and diseases, calling for large expenditures of time and money in their eradication and control, entailing an annual expenditure of money of something like three million dollars for materials alone, to which must be added an additional three millions for labor and application. This applies more largely to deciduous fruits. For citrus pest control in single counties, from $50,000 to $250,000 are expended, while the cost of inspection and quarantine regulations represents correspondingly large sums.

For the most part these injurious insects and plant diseases have been imported on plants, seed and fruit from foreign countries and adjacent states; now therefore be it

Resolved, That the California Association of Nurserymen, in convention assembled, hereby heartily endorses the federal quarantine recently promulgated by the federal department of agriculture, effective June 1, 1919, and hereby gives its undivided support to the efforts of the federal horticultural board in its endeavors to enforce this quarantine along lines that are protective in character, practical and just in application, and scientific in conception; and be it further

Resolved, That we deprecate any and all efforts on the part of special interests to have the same repealed, or so amended as to vitiate its force and effectiveness, excepting under such safeguards as the federal department of agriculture shall promulgate from time to time.

NEXT WEEK

Much of the good "copy" and some of illustrations of the personnel of the Riverside Conventions are necessarily held over till next week. Because of this and other features the next California Cultivator will be of special interest.

Red spider is reported showing up in many citrus orchards.

Pig Club Sale

The Lemoore Union High School District Pig Club holds its first annual sale of registered Poland-China and high grade Duroc-Jerseys on Saturday, June 7, 1919, at 1 o'clock sharp. Thirty-eight head will be offered, including tried sows, open gilts and young boars, which are some of the best ever offered in Kings County, as they have had individual attention during the best part of their growing period. This sale is held under the advice of the consulting committee, W. Bernstein, and M. Bassett of Hanford and H. D. McCune of Lemoore, all members of the Kings County Poland-China Association.

A Record Sale of Guernseys

A total of $180,275 for 83 Guernseys tells the story of the combination sale of Guernseys held at Florham Farms, Madison, New Jersey, on May 15. Sixty-one cows averaged $2003.69; 14 heifers averaged $946.43; eight bulls averaged $5600, and the average for 83 head was $2172.

The sale was topped by Florham Leader 55682, a two months' old calf, consigned by Anderson T. Herd, New Hope, Pennsylvania, and was purchased by the Oaks Farm and Hugh Bancroft of Massachusetts for $25,000. This price sets a new record for the breed, being $10,500 in excess of any price previously reported for any Guernsey.

Florham Leader was sired by Ne Plus Ultra, the sire of 23 Advanced Register daughters, and is out of Langwater Nancy, the fourth cow in Class A. Langwater Nancy has four Advanced Register records, the largest of which is 18,783.5 pounds of milk and 1011.66 pounds of butter fat.

Shattuck Will Judge Polands

Chas. W. Paine, secretary of the California State Fair, announces that he has secured Thomas Shattuck of Hastings, Nebraska, to act as Poland-China judge. Shattuck, who was one of the pioneer breeders of the big type Polands, is rated very highly as a judge and has tied the ribbons at many of the leading shows, including the National Swine Show.

Lovejoy to Judge Berkshires.

Wyman N. Lovejoy, Roscoe, Illinois, has accepted the invitation of Secretary Chas. W. Paine to judge Berkshire swine at the California State Fair. Lovejoy is a national figure in live stock circles and is one of the most sought after swine judges.

Oregon Breeders at Sacramento Sale

The Reid Jersey sale held at Sacramento May 27, attracted a number of prominent Jersey breeders from Oregon. Among those attending the sale and who were buyers, were: C. C. Dickson, Shedd; Chas. Bushman, Sherwood and G. W. Dammeier, Portland. The visiting breeders were generally impressed with the future for Jerseys in California and several expressed the intention of showing at the coming State fair.

A New Shorthorn Record

Live stock price records have been broken so persistently the past few weeks that one almost ceases to marvel at the new values established with each week. When on May 15 H. C. Lookabaugh of Watonga, Oklahoma, sold 38 head of Shorthorns for an average of $2943 he established the highest sale record ever made in America on Shorthorns of Scotch breeding. In that remarkable sale three bulls, all sons of the dead Fair Acre's Sultan, averaged $10,316 each—the top, Fair Acre's Sultan, Jr., selling for $17,250. Sixteen sons and daughters of Fair Acre's Sultan sold for a total of $59,700, an average of $3731.

Youngsters

Greenwood Farm, Live Oak, reports the following sales of its popular Duroc-Jerseys; two sow pigs to W. T. Bandy of Briggs, a boar pig to M. J. Newcom, Yuba City and three sow pigs to Harvey Berglund, Dixon.

Guernseys Make History

While Shorthorns were making new sale records in the West, Guernsey breeders met at Florham Farms, Madison, New Jersey, and paid $180,275 for 83 head of cows and bulls—an average of $2172. The top price of the sale was fetched by Florham Leader, a 67 day-old bull calf, that sold for $25,000 to Hugh Bancroft, Cohasset, Massachusetts.

California breeders will be interested to know that W. H. Dupee of Santee was the runner-up. Mr. Dupee selected three of the choice females, paying $5500, $3400 and $2250 for Pearl Rose of Beaver Ridge, Maxixe of Annandale and Duchess of Maple Hill, respectively.

The highest priced female of the offering was Follyland Nancy, purchased by Herdlea Farms, New Hope, Pennsylvania, for $12,500—a new record for the breed. The sale was the second annual event held under the auspices of the American Guernsey Cattle Club.

Blackhawk Shorthorns Arrive

E. Lovell, manager of the Blackhawk ranch, Diablo, who has been in the East selecting a collection of Shorthorns, reports that the cattle are now at the ranch.

Practically the entire lot represent desirable Scotch tribes and include a number of choice granddaughters of Villager and the bull, Roan Radiant, by Radium, the sire that has made a notable record in the Bellows herd.

Radium was sired by Double Dale, who was by Avondale, the best son of Whitehall Sultan.

The Blackhawk herd will be one to reckon with in the future.

Promoter of Hog Syndicate Arrested

David H. Riker, fugitive president of the Associated Swine Breeders, Inc., one of the many hog-raising syndicates that flourished a few months ago in San Francisco, has been arrested in Kansas City, Missouri. Riker is alleged to have misappropriated $50,000 money invested by city people anxious to get rich in the hog business.

DESERTING IN STYLE

One morning, a short time before the armistice was signed, a company of Italians were astonished by the sudden appearance of an Austrian private who, with hands up, tumbled into their trench.

When questioned, he insisted that he was the body servant of an Austrian officer, who, intending to desert, had sent the man ahead with his personal belongings.

Sure enough, a few minutes later the master appeared!—Youth's Companion.

Holstein Bull Sells for $125,000

C. L. Hughes of the California Breeder's Sales and Pedigree Company, Sacramento, states that all records were smashed when the Holstein bull, Rag Apple the Great, sold in the Oliver Cabana sale at Elma, New York, for $125.000. Robert E. Pointer, Detroit, was the buyer. During the first three days of the five day sale 160 head of bulls and females sold for $661.600, an average of $4,135. Rag Apple Korndyke 8th., sire of Rag Apple the Great, sold for $60,000. Segis Hengerveld Fayne Johanna sold for $40,000 and her yearling daughter, Superba Segis Fayne Rag Apple sold for $22,000. Fairview Korndyke Mata, a daughter of King of the Pontiacs, sold for $35,000.

Rag Apple the Great was sired by Rag Apple Korndyke 8th., and his dam was Segis Fayne Johanna the first cow in the world to make fifty pounds of butter in seven days.

Segis Hengerveld Fayne Johanna, whose record is 47.35 pounds butter in seven days, is also a daughter of Segis Fayne Johanna.

When a son, daughter and grand daughter sell for a total of $187,000, an opportunity is afforded for wide speculation as to the value that might be placed on the dam. The dam, however, was not offered for sale.

Another instructive feature of the sale is the fact that Rag Apple Korndyke 8th the sire of the $125,000 bull and the $22,000 heifer was purchased a few years ago for $25,000. It is therefore made plain how a basis can be found for heavy investment in animals of extreme breeding.

Animal Parasites

By E. R. de Ong

IT IS not possible to compute the annoyance and suffering of animals from attacks of insects and parasitic pests. With the best of care it is impossible to escape these entirely, but a bit of thought and preparation on the part of the stock owner will save much loss. We are glad to give from the pen of E. R. de Ong hints on control of the fly pest. Later he will give us other articles touching upon buffalo gnats, bot flies, sheep ticks, lice, ticks, round worms, tape worms and liver flukes. All these subjects are worthy of more attention than has been given them.—Ed.

* * *

Flies

There are three different flies, which rather closely resemble each other, that are commonly found about the stable: (1) The common house fly, with which we are all familiar. This is not a biting insect. (2) The stable fly, of a similar size to the house fly, but of a lighter gray color and with a horny mouth-part bent up under the head. This fly pierces the skin of the animal it is feeding upon and sucks the blood. The stable fly seldom enters the house, unless on rainy days, when it is said that the flies are biting. In reality it is a different fly which we fail to distinguish from the house fly. (3) The horn fly, considerably smaller than the house fly, which feeds by piercing the skin and sucking the blood. These cluster around the horns or on the flank and rump of the animal fed upon. A serious pest of cattle.

The house fly deposits its eggs on fresh or at least damp manure, horse manure being the most attractive, although other kinds are used freely. The unmixed manure, if of a coarse or strawy material or the ground-up particles mixed into the corral floor make satisfactory breeding material for this fly, providing there is sufficient moisture present and the heat from fermentation is not too high. Both of these points are important. The stable fly breeds almost entirely in decaying vegetable matter, the waste around the feed racks, decaying straw piles or very coarse manure. The horn fly deposits its eggs on freshly dropped cattle manure. Dried cakes or small particles exposed to the sun and air are alike unfavorable. The logical control for all these flies then, is the proper handling of the manure. A concrete pit, for each stable, into which the fresh manure can be dumped each day and the scrapings from the corral, once or twice a week, is the ideal way for storing manure. Drains from the stable should carry the liquid manure into the pit, and when necessary the entire mass can be wet down often enough to prevent it from burning. This pit may be screened to prevent the flies from depositing eggs on the manure or it may be kept so wet that they will not breed in it. The pit should be built large enough to receive the manure for two or three months at a time, allowing about one and one-half cubic feet of manure and bedding daily for each horse. If a concrete pit is too expensive, then the manure should be piled in a compost heap at least five or six hundred feet from the barn, adding each fresh lot of manure to the top of the pile, until it is built up to the desired height. Manure piled in this way will ferment, thus generating sufficient heat in the interior of the pile to kill fly larvae, while in most situations in California the sun and wind soon dry the surface so that flies cannot breed in it. If a little water can be added occasionally to the compost heap, it will prevent overheating and thus secure a better grade of manure, but this is not necessary from the standpoint of fly prevention. If water is used it must be only in small quantities just sufficient to lower the temperatures and not to saturate the heap.

Besides the two methods of manure handling just mentioned, there are two other practical ways for California conditions; first, hauling direct from the stable, every four or five days, and spreading the load in a thin layer in the field. The manure spreader is the best for this type of work. If the accumulation is allowed to lie more than a week, the larvae hatching from eggs laid the first day or two, will have matured and bored down into the ground to pupate and in a few days will be out as mature flies. The second method, is leaving the manure scattered on the floor of the corral. Then if there is enough stock running over it, the large lumps are soon ground up sufficiently to dry out. As long as manure remains in a fine powdered condition, flies cannot breed in it, but with the addition of moisture, breeding conditions become ideal. Fly larvae, in wet places in the corral or in stables with dirt floors, can be held in check, fairly well, by dusting these places freely with crude borax, powdered.

Stable flies favor decaying vegetation for breeding places, so rotting straw piles should be burned or scattered and plowed under. Horn flies, breeding almost entirely in fresh droppings, can only be checked by frequently cleaning the corral and hauling the manure to the compost pile or breaking up the lumps so that they dry in two or three days. This may be acomplished as has been suggested by the number of stock in a corral, especially with hogs following cattle or by the use of a slant tooth harrow or brush harrow used every three or four days.

If flies become very abundant before control measures are attempted, large numbers may be killed by spraying them with a 20 or 30 per cent oil emulsion, while they are clustered on the sides of the buildings early in the morning or late in the evening. Use an oil which evaporates readily such as engine distillate or kerosene to prevent the walls from becoming soaked with oil. The amount of oil used varies with the temperature. In very cool weather, weak emulsions are effective, the percentage of oil being increased as the flies are more easily disturbed. To make the emulsion, combine two or three gallons of oil with one or one and a half pounds of soap (dissolved) and then add sufficient water to make ten gallons. Pump this material through the nozzle back into the mixing barrel and in a few minutes a milky white emulsion is formed. If the oil still floats to the top of the water add more soap and agitate again.

Repellant mixtures to be sprayed

Now is the best time to buy a

DE LAVAL

CREAM SEPARATOR

THESE are the days when the farmer is getting the most milk, and with butterfat at its present high price he should be sure to get all the cream.

Many "claims" are made for various cream separators, but the most convincing proof that the De Laval is the cleanest skimming machine is the fact that 98% of the large creameries the world over use the De Laval.

Even if you do not separate as much cream as the large creameryman, you can no more afford to waste cream than he can.

THE ECONOMY OF FEEDING CHOPPED HAY----

ACME Feed Cutters

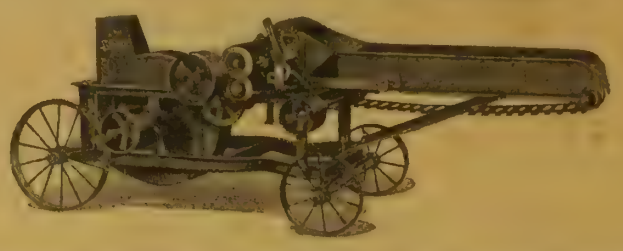
The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine.

Cattle invariably pick out and eat the finer and most palatable portions wherever fed ample rations of bulk hay. The coarse hay and stems are nosed out and discarded—wasted.

Common feeding methods in use entail much loss by trampling feed under foot.

These losses are too big to be neglected. They range from 10 per cent. to 25 per cent. of your hay. With hay worth 15.00 a ton in the field the average waste of 15 per cent is equal to $2.25—actual loss in dollars and cents on every ton of hay you feed.

Why continue to stand this loss? You can prevent it by running your hay through an Acme Feed Cutter.



Chopped Hay Prevents Waste

Chopped hay will feed more cows ton for ton than bulk hay. Chopped hay requires less barn space. It's easily handled and protected from the weather and is eaten up clean by the stock.

With a light-running Acme Cutter you can begin saving feed right away.

Chop this year's hay crop and blow it into the barn, bins or a silo with an Acme Cutter.

Every pound of feed saved adds to your profits.

The Durable Steel Frame Acme will pay for itself the first season

Nos. 11 or 13 for small acreages—No. 17,19,20,24 and 40 cover all feed cutting requirements

Superb Shorthorns

On Thursday, July 10

Carruthers Farms

Owned by W. M. Carruthers, Live Oak, California
Will Sell at Public Auction, to the highest bidder without reserve or limit

45 Scotch Shorthorn Cows Heifers and Bulls

including about a dozen great matrons with calves at foot. This is universally conceded to be the greatest offering of Scotch cattle ever made on the Pacific Coast.

Carruthers Farms

W. M. Carruthers, Prop. Live Oak, Cal.

The sale will be held on California State Fair Grounds, Sacramento, where part of the cattle may now be seen. After June 7 nearly all of the cattle will be on the sale grounds and visitors are cordially invited to call and inspect them.

Auctioneers: Reppert and Milne
Sales Managers: California Breeders Sales and Pedigree Co.
C. L. Hughes, Sales Manager, Sacramento, Cal.

over the body of cattle are of small value. The more durable ones, such as contain fish oil, soon become sticky and retain so much dust as to make them very objectionable. Weak solutions of carbolic acid and water may be used without this objection but are effective for only a few hours.

Horse Flies

Large, gray and black or green headed flies. One-half to one inch long. These are also known as gad flies or deer flies. The female fly feeds on the blood of horses, cattle and deer, its strong, sharp mouth parts being capable of piercing the skin of any of these animals. The males feed on plant secretion. The eggs are deposited on leaves and grass overhanging water. On hatching the young larvae drop into the water and there remain until ready to change into flies, feeding in the shallow water or mud along the bank, on other insects or crustacea. The larvae live in this situation through the summer, emerging as mature flies the following spring. The horse fly larva is much larger than that of the house fly, almost white and with 11 distinct segments to the body. They possess strong, piercing mouth parts, as do the adults, capable of causing a severe wound to the hand.

There is no satisfactory control for these blood thirsty flies, except destroying their breeding grounds. The drainage of swamp land and the cleaning and deepening of permanent water ways will aid in reducing their numbers. Keeping stock in dark sheds or barns through the middle of the day will lessen the annoyance from this fly.

SCOURS AND THUMPS IN PIGS

Perhaps the most common troubles caused by lack of proper attention to the feeding and care of pigs are scours and thumps, according to L. A. Weaver of the University of Missouri college of agriculture. Scours are usually caused by changing the feed of the sow, overfeeding, dirty pens and troughs, or exposure of either sow or pigs to cold rain or cold weather in such a way that they become chilled.

Since the cause of scours is something which causes indigestion, the thing to watch especially is the feed. Changing from sweet to sour milk will often cause the trouble, as will also the feeding of too much of the high protein feeds, such as tankage or linseed oil meal, when the animal is not used to them. If the sow is fed too much, her milk flow is so stimulated that very young pigs will get more than they can utilize, thus causing them to scour. Pigs should always be kept in dry, clean quarters and fed in clean troughs. They should not be allowed to run out in cold rain or allowed to become chilled in any way. Sows running through filth and then being suckled will often cause pigs to scour.

There are a good many remedies used for this trouble. The first thing to do is to cut down on the sow's feed and clean up her quarters if they need it. A tablespoon of sulphur in the sow's feed for two days is also good. If the sow is given a good physic such as Epsom salts, good results will follow. Scalded milk is also a good remedy. Each pig may be given a good physic, such as a teaspoon of castor oil or Epsom salts. Charcoal is also good.

There is also a contagious form of scours, white scours. The cure is to clean and disinfect pens and give a good physic.

Thumps often occur in young pigs. It results from lack of sunshine and exercise, and from high feeding. The remedy is to cut down the sow's feed and force the pigs to take exercise out in the sunshine. Thumps may also occur in large pigs after they are weaned, but when old pigs have it, it is usually caused by some infection of the lungs or bronchial tubes.

FRESNO POLAND-CHINA BREEDERS

Breeders of Poland-Chinas in Fresno County recently gathered and in the course of the banquet perfected an organization which will boost for Poland-China interests. There are nearly 30 charter members, beside several associate members, with promise of material increase.

(Continued on Page 795.)

SALT FOR COWS
THEY MUST HAVE IT

Experiments Prove that Without It Their Vitality Suffers and Their Milk Runs Low.

Simplest Method of Supplying Needed Amount Is to Salt Hay While Stacking or Baling

(From Pacific Rural Press)

Salt is such a common thing that the very important part it plays in the health and milk yield of the dairy herd is perhaps not realized by many farmers.

Experiments conducted at the Wisconsin State Experiment Station prove conclusively that salt should be supplied to dairy cows unless the ration furnishes a sufficiency thereof. It is calculated that the minimum quantity in the food to keep a cow of 1000 pounds live weight in flourishing health is that which is equivalent to ¾ ounces of salt per day, and that a cow in milk needs as much more as will restore the proportion removed in the milk, namely, a little over ½ ounce of salt for every 20 pounds of milk.

The conclusions from these experiments are briefly as follows:

"In every case the cows exhibited an abnormal appetite for salt after having been deprived of it for two or three weeks, but in no case did the health of the animal, as shown by the general appearance, the live weight, or the yield of milk, appear to be affected until a much longer time had elapsed. This period of immunity varied with individual cows from less than a month to more than a year. There was finally reached a condition of low vitality in which a sudden and complete breakdown occurred. This stage was marked by loss of appetite, a generally haggard appearance, lusterless eyes, a rough coat, and a very rapid decline in both live weight and yield of milk. If salt was supplied at this period recovery was rapid. In one case potassium chlorid was given instead of common salt (sodium chlorid). Considerable of the potassium salt was eaten, though cows ordinarily refuse to touch it, and recovery followed as quickly as when common salt was supplied—evidence that not the lack of the sodium but the lack of chlorin was responsible for the troubles. The breakdown due to the lack of salt usually occurred after calving, when the milk flow was heavy, and generally the cows giving the largest amount of milk were the first to show distress."

Farmers who salt their hay when stacking or baling have found the plan an excellent and profitable one. The salt more than pays for itself in the increased weight of the hay, and besides improving the feed, it removes the danger of musting by checking the growth of molds when the moisture content of the hay is high. This is particularly true of alfalfa hay.

Twenty pounds of salt to each ton of hay should be used, which should be sprinkled on by hand as each three feet of the hay is stacked.

Only Bull Calves For Sale

When Writing Advertisers, Mention the Cultivator.

A Record Jersey Sale

On May 27, at the State Fair Grounds, Sacramento, some new and encouraging pages were added to the history of Jersey cattle in California. On the above date Clifford F. Reid of Portland, Oregon, dispersed his entire herd, consisting of 41 bulls and females, which included Goldie's Nehalem Beauty, who as a junior 3-year-old held the world's record, and the following year as a senior 4-year-old produced 904.91 lbs. fat, the world's record at the time. It was the first time a world's record cow had ever been offered at public sale, and when she was purchased by Dr. H. W. Hand, Orland, president of the California Jersey Cattle Club, for $1700, she became the highest priced Jersey cow ever sold in this state, and the first cow of the breed to sell in California for more than $1000.

The $1000 mark was passed four times. The 9-year-old India's Goldie, dam of the world's record cow, was purchased by Charles Buchanan of Sherwood, Oregon, for $1200. One of the best buys of the sale was made by J. E. Thorp, Lockeford, who bought Eminent's Wardress for $1200. This cow is one of the rarest types ever sold in any sale. She has a long list of show ring honors, and in addition has a Register of Merit record of 439.3 lbs. fat made at the age of 1 year and 11 months. Goldie's Catillon Beauty a 2-year-old daughter of Goldie's Nehalem Beauty, was purchased on order for Ayer and McKinney, Delhi, New York.

The top price for a bull, $850, was paid by E. F. Smith, Haywards, for Goldie's Nehalem Gold, the yearling son of the record cow and sired by a son of hers. Dr. H. J. Belknap, owner of the Jersey Queen Farm, San Jose, was the heaviest buyer, securing six of the choicer females for a total of $3095. The doctor was the contending bidder on Eminent Wardress. Guy M. Bougher of Orland selected five head.

The sale totaled $16,040, an average of $391, considered highly satisfactory in view of the fact that a large part of the offering was made up of calves.

The sale was under the management of C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento. Col. Ben A. Rhoades of Los Angeles was the auctioneer.

A complete list of sales follows:

BULLS

1. Goldie's Golden Eminent—September, 1914; George P. Robinson, Sacramento, $100.

8. Goldie's Nehalem Peerless—September, 1918; A. B. Purvine, Petaluma, $65.

11. Goldie's Nehalem Fox—July, 1918; Dr. J. F. Tapley, Marysville, $250.

13. Goldie's Nehalem Financial—October, 1918; George P. Robinson, $100.

14. Goldie's Nehalem Eminent—June, 1918; W. B. Mordecai, Petaluma, $175.

18. Goldie's Nehalem Lad—December, 1918; Guy W. Bougher, Orland, $195.

23. Goldie's Nehalem Gold—E. F. Smith, Haywards, $850.

24. Fussy's Fern Noble IX—April, 1916; E. E. Greenough, Merced, $225.

FEMALES

2. Goldie's Nehalem Beauty—May, 1912, 904.91 lbs. fat; Dr. H. W. Hand, Orland, $1700.

3. Goldie's Catillon Beauty—November, 1916; Merridale Farm, Delhi, New York, $1050.

4. Goldie's Princess of Reid Farm March, 1917; E. R. Strain, Bolinas, $390.

5. India's Goldie—February, 1910; Charles Bushman, Sherwood, Oregon, $1200.

6. Goldie's Nehalem Fern—November, 1919; A. W. Nolan, Forestville, $165.

7. Fern's Nehalem Goldie—October, 1918; J. M. Dickson & Son, Shedd, Oregon, $500.

9. Goldie's Catillon Princess—May, 1918; Guy W. Bougher, $175.

10. Goldie's Golden Princess—March, 1919; E. E. Greenough, Merced, $130.

12. Goldie's Nehalem Lassie—September, 1918; C. A. Arwedson, College City, $175.

R. F. Guerin

R. F. GUERIN BUYS K. P. TOLA

R. F. Guerin, breeder of Holsteins and Poland-Chinas, Visalia, was in attendance both days of the McAlister dispersal sale and secured several as additions to his present large herd.

When the cow K. P. Tola, with a record of 33.98 pounds butter in seven days and 140 pounds in 30 days, was driven into the ring it seemed from the way the bidding started off that there were several there desirous of owning her.

It finally narrowed down, however, to Mr. Guerin and Mr. Magruder of Ripon, Mr. Guerin finally securing her for $3950, the top price of the sale.

K. P. Tola
Butter seven days, 33.98 pounds; 30 days, 140 pounds.

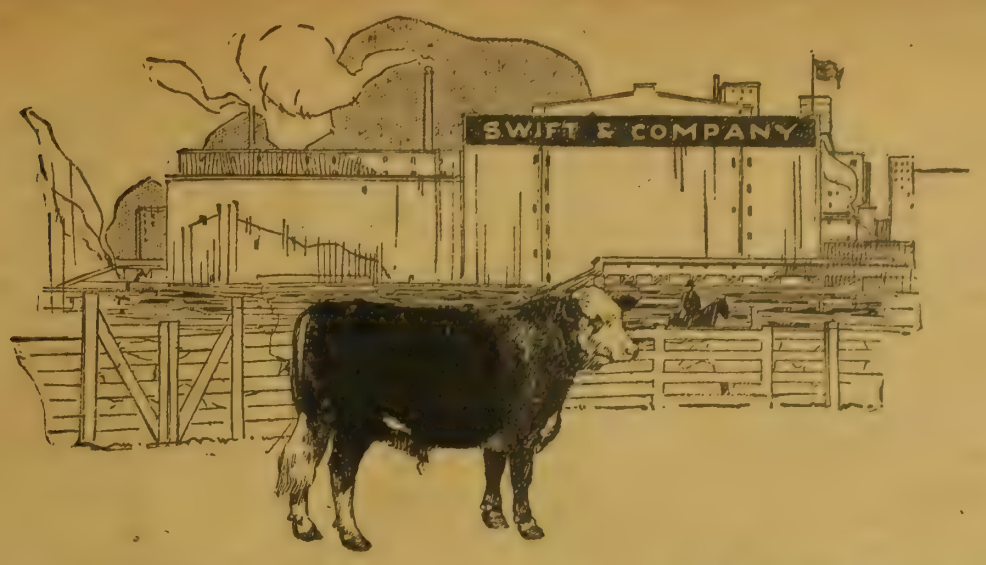
A SHORTHORN SALE OF RARE QUALITY

There is much activity in the various Shorthorn camps of California, and 1919 promises to be a record year in more ways than one. Not only will there be more sales held this year than any previous two years, but new standards of quality and values have been and will be established. Shorthorn interests are determined to not only hold their position but to strengthen it in every way possible.

Just now all eyes are turned to the offering that W. M. Carruthers has in preparation for his sale to be held at the state fair grounds, Sacramento, June 10. Carruthers has long held a commanding position in the breeds' affairs on the coast and has been responsible for the production and distribution of some of the most valuable cattle in the state. For the approaching sale he has selected what is generally conceded to be the choicest lot of cattle ever offered in any one sale held on this western coast. The cattle have been selected with the idea of furnishing established breeders and those about to engage in the business an opportunity to buy at auction females and bulls of a character, both as regards breeding and individuality, that will prove attractive material for any herd.



A feature of the offering will be the selling of most of the show herd that was out last year, as well as some of the top females of the herd

A distribution of such a class of cattle will mean much to the Shorthorn interests in this state.

From time to time more detailed announcement of the offering will be made.

The sale will be by the California Breeders Sales and Pedigree Company, of which C. L. Hughes is manager.

The same company will manage the Shorthorn sale to be held August 2 by the Butte City Ranch, Butte City, and October 16, by Dr. H. M. Elberg, Woodland, notices of which will appear in due time.

A steer is worth $1.02 to Swift & Company

That amount is profit

Cattle raisers received an average of $92.70 apiece for live cattle in 1918 from Swift & Company.

But Swift & Company made a profit of only $1.02 on each animal. Think of the work involved—dressing, distributing, selling, using the by-products, financing, and maintaining mighty plants—done for only $1.02 profit on each $92.70 steer. Only by dressing over 3,000,000 a year can we afford to do business on so small a margin.

This $1.02 profit per animal made by Swift & Company includes all that was cleared from each animal on its cured hide, tallow, fat, bones, and other packing-house by-products, as well as the meat.

Here are the figures:

	Average per head
Paid for live cattle (all grades)	$92.70
Received for meat	$81.45
Received for by-products	22.06
Total receipts	103.51
Amount remaining for expense and profit	10.81
Expenses	9.79
Profit (interest not deducted)	1.02

What other system or organization of the packing industry can bring about a higher price to live stock raisers and at the same time a lower price in the sale of meats?

Serving the cattle raiser and the public at a cost of only $1.02 per steer is rather economical, isn't it?

Swift & Company, U. S. A.

Founded 1868

GLOBE MILLS, LOS ANGELES

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

What is a Shorthorn Bull Worth?

If a registered Shorthorn bull during his life sires 100 calves worth $50 more per head than calves from the same dams by a scrub bull he is worth $500. If they sell for $10 more he is worth $1,000. If $20 more, he is worth $2,000.

But suppose they sell for $50 more—what is he worth? He is actually worth $5,000 in gold.

It will pay you to use a high class Shorthorn bull. He will cost much less than his value.

You get paid for quality and pounds both at the beef markets. Many a 1,600 pound Shorthorn cow yields from 7,000 to 10,000 pounds of milk per year.

POULTRY

THE MISSION HATCHERY
Does not claim that June is the best month to raise chicks. You've got to know how to do it right. We have them—and good ones—stamina and vitality top notch, and we can pack them to travel safely; and will also send customers our circular on raising summer and fall chicks successfully.
FIRST COMES QUALITY—no use wasting time on scrubs, if you mean business. Then comes price—you can pay high or low, and get stuck both ways. A reasonable price with a reliable firm beats both bargains and humbugs.
WE CAN SUPPLY LEGHORNS—White-Brown-Buff—large or small lots, promptly. R. I. Reds, Barred, White Rocks, Black, White Minorcas, Anconas — that are the cream of their kind. We sell what we hatch—no rehandled or second hand chicks—and our hatchery is one of the most efficient plants in the state—capacity 15,000 chicks weekly. Why not get acquainted? Circular and prices for the asking. THE MISSION HATCHERY, Box 27, Campbell, California.

Baby Chicks For Sale—250,000 S. C. White Leghorn baby chicks from heaviest laying (Hoganized) stock. 25, $3.50; 50, $7.00; 100, $12.50. Special prices, 500 and 1000 lots. Safe delivery guaranteed. You pay only for chicks received alive and in good condition. No money in advance; pay on delivery. Shipped safely anywhere West of Rockies. Finest hatchery in the world. Established 1898. Must Hatch Incubator Company, 488 Seventh Street, Petaluma, California.

White Leghorns are the most profitable breed of poultry. If you are in the business for profit you will eventually have them. Early broilers; early payers; early PROFITS. We sell only WHITE LEGHORN BABY CHIX from heavy laying HOGAINIZED hens. Safe delivery of full count live chix guaranteed. Prices per 100; February, $15; March, $14; April, $12.50. The Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

Baby Chicks, Hatching Eggs, Breeding Males, Barred Rock, Ancona, R. I. Red, Black Minorcas, White Minorcas, White Orpingtons, Black Orpingtons, Light Brahmas, Buff Leghorns, Brown Leghorns and Macfarlane White Leghorns, CHICKS and EGGS. Duck, Geese, Turkey eggs. Circular free. POULTRYMEN'S COOPERATIVE HATCHERY, D. E. Doke, Mgr., 732 S. Spring, Los Angeles.

It's like groping in the dark to attempt raising poultry successfully without some knowledge of the business. COOP THE MOTHER HEN

It is not good poultry management to allow the mother hen to range unrestricted with her chicks. With such freedom the hen frequently takes her brood through wet grass and, as a result, some are chilled and die, especialy the weaker ones which are likely to be left behind. The loss of young chicks which follows such a practice is large and mainly preventable. Furthermore, the food which a brood allowed to range with the hen obtains goes very largely to keep up the heat of the body and the chicks do not make as good growth as they otherwise would.

Chick losses of this nature can be largely prevented by shutting the hen in a coop. Any style of coop which is dry, ventilated, and can be closed at night to protect the brood against cats, rats, and other animals, and which, while confining the hen, will allow the chicks to pass in and out freely after they are a few days' old, will be satisfactory. The hen should be confined until the chicks are weaned, though a small yard may be attached to the coop, if desired, to allow the hen to exercise. The fence can be raised from the ground far enough to allow the chicks to go in or out, but not high enough for the hen to escape. By using a coop the chicks can find shelter and warmth under the hen at any time and the weaklings, after a few days, may develop into strong, healthy chicks.

COMBINE UTILITY AND STANDARD QUALITY IN POULTRY

A hen, in order to be classed as a genuinely good one, should be equally capable of going in the show ring and taking a ribbon or of going on the yard and making a record as a layer. And the breeder, in order to get the advantage of the best and broadest markets, must breed for a combination of utility and standard quality instead of following the tendency to become either a fancier or a utility breeder. That is the advice of Robert B. Slocum, a poultry specialist of the United States department of agriculture, and it is based largely on results obtained on the poultry farm of the department at Beltsville, Maryland, where many of the exhibition males used have 200 egg production in their pedigrees.

"Except in a few more or less isolated cases," says Mr. Slocum, "there is nothing in the standard requirements directly opposed to utility, and the buyers during the past few years have shown an increasingly insistent demand for fowls that have egg producing ability back of them."

PRODUCE INFERTILE EGGS

The eggs laid by a hen may be either fertile or infertile, depending on whether or not the male bird has been allowed to run with the female. Egg production is equally great in flocks from which roosters are excluded.

A fertile egg does not keep as well as an infertile one. Infertile eggs are much more likely to reach the table in good condition and there is much less spoilage in shipments composed entirely of them than in mixed shipments of fertile and infertile eggs.

After the hatching season, therefore, the male birds should be cooked, sold or confined. In approximately 14 days after this all the eggs laid by the hens will be infertile. These can be marketed much more successfully under the adverse conditions that frequently prevail in the hot summer months.

RULES FOR HANDLING EGGS ON THE FARM

Heat is the great enemy of eggs, both fertile and infertile. The following of these simple rules costs nothing but time and thought and will add dollars to the poultry yard returns:

Keep the nests clean; provide one nest for every four hens.

Gather the eggs twice daily

Keep the eggs in a cool, dry room or cellar.

Market the eggs at least twice a week.

Sell, kill, or confine all male birds as soon as the hatching season is over.

Where chicks are raised with hens, they are likely to become infested with lice. If the lice get very numerous, they greatly retard the chicks' growth and may even cause their death. The hen should be powdered thoroughly with some good insect powder before she is put in the coop with the chicks, and at intervals of several days or a week thereafter. The baby chicks should be examined for lice, particularly on the head, under the wings and about the vent. If any are found, a little grease, such as lard, should be rubbed on in those places. Apply grease moderately, as too much will injure the chicks. The chicks should be examined frequently and the treatment repeated if lice are found on them

---

Avoid overcrowding growing chicks. A coop, brooder, or colony house that was large enough to hold the baby chicks is not large enough after two or more months, depending on the breed and growth. It is absolutely necessary that growing chicks have plenty of room to grow. Cockerels that are sufficiently large should be disposed of. Chicks that have not shown proper growth should also be separated and leg or wing banded. Many of these chicks, even the pullets, should be marketed. Only the good, strong, vigorous specimens should be retained as breeders and layers, as these are the only ones that can return a profit.

Growing chicks will not eat too much if they have plenty of range so they can get the desired exercise. A good growing mash should be accessible at all times to growing chicks. Such a mash should contain plenty of bone meal, ground very fine, and fine ground oats and barley. Be sure to have the mash ground very fine.

Growing chicks that are kept closely confined need much greater attention along all lines than those that have range. See that they have plenty of green feeds that have not wilted down to almost the decaying point and that the yards are kept sweet. Culling also is more essential when chicks are closely confined.

One of the most important factors in keeping young chicks growing is good, clean, fresh water in vessels. As the days get warmer care should be taken to change the water as often as required to keep it clean and fresh.

CUNNING AS A FOX

While sitting on the bank of a small stream, writes a Companion subscriber, a friend and I heard some hounds baying on the opposite side of the creek. We were guessing what they might be chasing, when all at once we saw a two-thirds grown rabbit come from the weeds and slowly walk into the water until it got so deep that he was compelled to swim. We thought that the little animal was coming across; but suddenly he turned upstream and swam for some two or three rods, and then he climbed out on the bank and disappeared in the weeds and underbrush.

A few moments later the hounds came to the water and lost the trail. If that were not a piece of cunning on the part of bunny, I am much mistaken.—Youth's Companion.

Seashore PACIFIC ELECTRIC Mountains

Vacation Time

is here again and many of us are planning to spend a goodly portion of that time at one of the numerous seaside resorts while others will prefer the mountains—

In either case the PACIFIC ELECTRIC RAILWAY offers unexcelled service to seaside resorts and direct connections to many mountain camps.

SEASIDE RESORTS

Venice, Ocean Park, Santa Monica, Hermosa Beach, Manhattan Beach, Redondo Beach, Long Beach, Seal Beach, Huntington Beach, Newport Beach, Balboa.

MOUNTAIN RESORTS

Mt. Lowe, Camp Baldy, Hoegee's Camp, Glenn Ranch, Cold Brook Camp, Camp Rincon, Follow's Camp, Strain's Camp, and San Bernardino Mountain Resorts.

Load up your Auto-Wheel

Boys, stop straining your arms and back carrying stovewood, heavy sacks of feed and other heavy things about the farm. Get an Auto-Wheel Convertible Roadster—you can speedily carry several hundred pounds without straining a bit. And when you've finished work, coast down hill or on the road—show the other fellows what real coasting means. You can't beat the Auto-Wheel for speed and strength. The Auto-Wheel Convertible Roadster is the newest Coaster Wagon. The patented convertible sides make it two wagons in one—a roadster and a coaster. When you want to coast, turn up the sides and away you go. Turn down the sides and you have a regular Roadster—ready for the heaviest load. If you're a real boy, you'll never be happy without an Auto-Wheel.

A Roadster and Coaster Combined

WANT A FREE FELT PENNANT?

Write us the names of three coaster wagon dealers, mentioning which one handles the Auto-Wheel. We'll send you a beautiful booklet, showing Auto-Wheel Convertible Roadsters and Auto-Wheel Coasters. Write today.

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns distillate costing only 7½ cents per gallon in cook stoves, heaters, furnaces, pasteurizers, boilers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes, address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

Household Department

A GARDEN WEDDING

Margaret Wentworth Leighton

The Bachelor Button declared
He was tired of bachelorhood,
And if Marguerite was willing,
Marry and settle he should.

And so it came to pass
On a balmy night in June,
The Harebells and the Bluebells
Rang out a marriage tune.

The frisky little fireflies
Their flashing lanterns swung,
And on the spreading bushes
The glowworm lamps were hung.

Each tiny field musician,
With fiddle tucked away,
Came hopping, skipping, flying,
The wedding march to play.

From his home in the lowland meadow
Came Jack-in-the-Pulpit trim,
And the nuptial knot for the bridal pair,
Was neatly tied by him.

The lovely Valley Lilies
All waited on the bride.
Sweet William and the Rose Bud
Walked slowly side by side.

The Pansies, all in velvet,
With Dandelions gay,
Danced and pirouetted
Until the break of day.

The Monks, so tall and solemn,
In hoods of faded blue.
Feasted, frisked and frolicked
All the long night through.

In gowns of dingy yellow
The poor Wall Flowers stood.
No gallant asked them once to dance—
I wonder if they could?

Joe-Pye-Weed waltzed with Lily,
Thistle with Bouncing Bet,
Violet danced with Primrose,
And Clover and Mignonette.

The Sensitive Plant was frightened
(She feared she might be kissed
By bold Snap Dragon as he passed,
With dainty Maid-in-the-Mist).

At last the guests departed,
And Lady's Slipper fair,
Adroitly tossed her moccasin
After the bridal pair.

THE FLOWER DOLLS

THE flower folk live all the year round in California. Here is a story of some of their cousins who live in Michigan in spring and summer. This story was told in the Grand Traverse Herald:

Nothing makes a better flower lady than a lilac leaf. Just fold it over and fasten it with a thorn or bit of stem sharpened, put any sort of floweret on the stem for a hat, and behold you have a grand and stately lady with a sweeping train. She has the narrow, sloping shoulders and the drooping figure considered so graceful a hundred years or so ago.

But trim off her train, bind her waist with a bit of grass, fold the cut-off point of the leaf and stick it on top of the stem and here you have a demure little nun with great flaring cap, such nuns as you see going silently about the streets of any Breton town.

The little morning glory girl as fragile as she is beautiful, must have two toothpick legs inserted, and even then she must stand on a friendly apple or in the soft earth of a flower pot into which the sharp points can stick, where she will stand poised, like a real fairy just alighted for a moment, and ready to take flight at any rude word or motion.

Soon comes the gorgeous golden glow—a ballet dancer is she. Two matches sharpened at the points form her legs, and with a saucy hat of snap-dragon, or a floweret of the humbler butter-and-eggs, it takes but little fancy to see her kicking off the hat of the venerable Mr. Pine, who, with his haughty wife, walks so sedately across the table.

And do they really walk? you ask. Try them and see. The Pine family are great pedestrians. Take a bunch of pine needls on the end of a stem. Holding them in a close bunch, cut them off to form a flat base so that they will stand, leaving enough stem for body and head. My Lady Pine and her children may be dressed in any leaves and flowers you will. Her natural hoopskirt will give any raiment a grand air. For her spouse more care is necessary. A few needles must be trimmed out to give him proper legs, which must then be clothed in two long, narrow leaves—or ideal for the purpose are the large hollow stems of the melon or the gourd vine, or, in early spring, the stems of the daffodil. His coat must be a swallowtail to which a grape leaf lends itself very well. Almost any little green calyx will furnish him with a hat, and with one pine needle left out for a walking stick he is ready for a promenade with his family.

Set the Pine family in marching order on a smooth polished table, get down and blow very softly along its surface, and they will amble along with just the proper gait of any well dressed family out for its Sunday stroll.

Daffodils are gay and frivolous ladies, and fallen tulip petals make the most wonderful coats.

In midsummer the everywhere present Queen Anne's lace, just as it goes to seed, furnishes a wonderful petticoat to be not quite concealed by an over drapery of hollyhock or of petunia. The rugged little seed bunch stands alone and makes a most sturdy if somewhat stocky little dame.

Many other flowers will suggest themselves and will well repay in beauty the little girl or boy who handles gently and skilfully the fragile fabrics that mother nature provides for making flower dolls.

OUR YEAR ROUND GARDEN FAMILY

By Ellen Eddy Shaw

Ally, Di, Sonny, Johnny and William. It is lovely to have a big family, isn't it? The summer flower family is a great big family, oh, so much larger than just the few children of the other seasons. I think any boy or girl can see why it is easier to have a big family in summer. It is because then you can keep them all outdoors, and in other seasons of the year you have to have the children in the house. You know how it is.

Now, who are these children called Ally, Di, Sonny, Johnny, and William? I will tell you all about them. Ally is the nicest little girl you ever saw and never causes any trouble. Mother buys you a small package of dwarf sweet alyssum seeds, as sweet alyssum is our little Ally, and you place the seeds one by one about an inch apart, and one-half an inch deep in your garden bed. By and by up will come little plants, and they will grow about six or eight inches high. In five or six weeks Ally will have a white blossom just like a little white head.

When it gets toward the middle of the summer give Ally a hair cut. Cut little Ally down within two inches of the ground and what do you suppose will happen? She will come up again and will have her same little white head all through the fall.

Who is Di? Di is also a girl, but she is larger than Ally. Her long name is dianthus, and sometimes we call her pink. Di is an old-fashioned child. You plant the seeds of dianthus just as you did those of sweet alyssum, but dianthus grows much taller and has a pink blossom, or a white one, and smells as sweet as can be.

Sonny, sometimes called sunflower, has great big seeds. You pick one up very carefully and you plant it an inch deep in the ground, and you plant another one a foot away. By and by up grows this big, strong boy, and later on in the summer Sonny has a yellow head—a huge yellow head with a Dutch hair cut. Now just you watch and see!

Johnny is a different kind of boy from Sonny. He is a quick little chap, sometimes called little "Johnny Jump Up," and by some people called Pansy. But I like the name of "Johnny Jump Up" best, don't you? Ask mother to buy you some pansy plants and as they blossom, pick the blossoms as fast as you can because then you will have more and more. I think "Johnny Jump Up" is one of the smartest of our children.

We have one child left in our summer flower family, William. Sweet William is a slow boy. He is so slow that he generally refuses to have any blossoms at all until the second summer, and so you have to wait a whole year before you see his face. Plant Sweet William seeds just as you did Sweet Alyssum, and the plants will come up in the spring, but very slowly. By fall Sweet William may have one blossom, but he probably will not have any.

Do you not like these children? I do. Then do not forget to have one or more children this summer. You can choose Ally, Di, Sonny, Johnny or slow little William. Which one are you going to have?

If you are a little city boy or girl and have no outdoor garden, you may plant all of these summer children except Sweet William and Sunflower in a box. Sunflower is too tall and Sweet William is too slow, but Ally, Di, and Johnny will blossom just as well in a window box as in a garden.

SAVING TIME AND MONEY BY HOUSECLEANING EASY AND OFTEN

The United States treasury department is issuing as one of its war savings thrift series of publications some good hints on saving time and energy in housecleaning. Seems a bit odd for the treasury department to tell us how to mop floors and wash windows, but if time is money, then time saved is money saved—and there you are;

Walls

Wipe down frequently with a broom covered with a canton flannel bag, with a long-handled soft brush, or a lamb's wool brush.

Use light, even, overlapping strokes to remove rather than rub in the dirt.

Rub soiled places over radiators, registers, and stoves lightly with cotton batting, changing the cotton as it becomes soiled. Guard against such soiled places by keeping the fixtures and the floor around them free from dust.

Wash oil-painted walls and ceilings like painted woodwork.

Wipe glazed wall paper with a cloth wrung tightly out of warm, soapy water. Do not leave any moisture on the paper; it seeps in at the seams and loosens the paper.

Windows and Mirrors

Rub frequently with soft paper; this keeps the glass clear.

When washing is necessary, use a clean, lintless cloth wrung well out of clear water, or water to which kerosene, alcohol, or washing soda has been added. To get a clear glass work quickly with even strokes and wipe at once with a clean, dry cloth or soft paper.

Glass may be dry-cleaned with a paste made by moistening a fine powder such as whiting. Rub on the glass, let dry, then polish with a cloth or paper.

Woodwork

Dust frequently. For floors, use string mop or broom covered with bag.

Sweep floors occasionally with a soft brush.

Wash when necessary with soapy water. Wring cloth very dry; rub with even strokes. Wipe dry at once. If spots remain after washing, scour, wipe clean and dry.

Wipe off spots and finger marks around door knobs, handles, window latches, etc., frequently, using a dampened cloth. This saves labor and wear.

Unfinished: Beware of using too much water, soap, or cleaning powder. They discolor the wood.

Painted: Use a cloth well wrung out of light suds made with white soap. Soap applied directly softens and dulls the surface of paint.

Enamel Painted: Use hot water. This dissolves grease and frees dirt. It does not harm gloss. Soap dulls enamel.

Oiled, Varnished, and Shellacked: Use oiled duster or mop. When dingy and black, wash like paint. To revive finish, rub with cloth sprinkled with linseed oil or furniture polish.

Waxed: Use dry mops and dusters. Avoid oil; it softens wax so that dirt settles in it.

Carpets and Carpet Rugs

In cleaning indoors, avoid scattering the dust.

Carpet sweepers keep the dust from flying, take up surface dust, and are excellent for daily use. Their brushes do not reach deep enough into the fabric for thorough cleaning.

Vacuum cleaners suck the fine dust out of the interior of the fabric, thus saving hard work and wear on furnishings.

When heavy sweeping is done by hand, use a corn broom with short, firm strokes.

Where possible take rugs out of doors for an occasional cleaning. It freshens them and lessens the danger from moths. Lay right side down on the grass. Beat with a flat, springy beater, sweep, turn right side up, and sweep again. Do not hang on a line to beat, or shake by holding one end or corner. Such treatment weakens the threads, even in small, light rugs.

Matting

Sweep with a soft brush. Wipe with a slightly dampened cloth.

Linoleum, Oilcloth and Cork Carpet

Dust with a dry mop or covered broom. Sweep with a soft brush. Wash with a cloth wrung dry from soapy water, and dry thoroughly with a clean cloth. If too much water is used, it gets underneath and gradually rots the covering and the floor.

Furniture

Dust frequently.

For fine upholstry and carvings, use a soft pointed brush.

For heavy upholstry, and reed furniture, use a medium-soft pointed brush.

For leather, use an oiled duster.

Keep clean rather than make clean.

"For age and want save while you may. No morning sun lasts a whole day."—(Benjamin Franklin.) Buy Thrift Stamps and W. S. S.

BEANS ARE GOOD

Boston Baked Beans

Soak one quart beans and cook until tender, but not so soft that they will fall apart. If desired, one quarter pound of salt pork may be cooked with them. When tender, add one-half teaspoon mustard, one tablespoon sugar or two tablespoons molasses, and one tablespoon salt. Bake in a covered dish for one and one-half hours, leaving them uncovered for the last 15 minutes.

If you have any beans left over why not make a loaf that you can serve for dinner in place of meat?

Instead-of-Meat Loaf

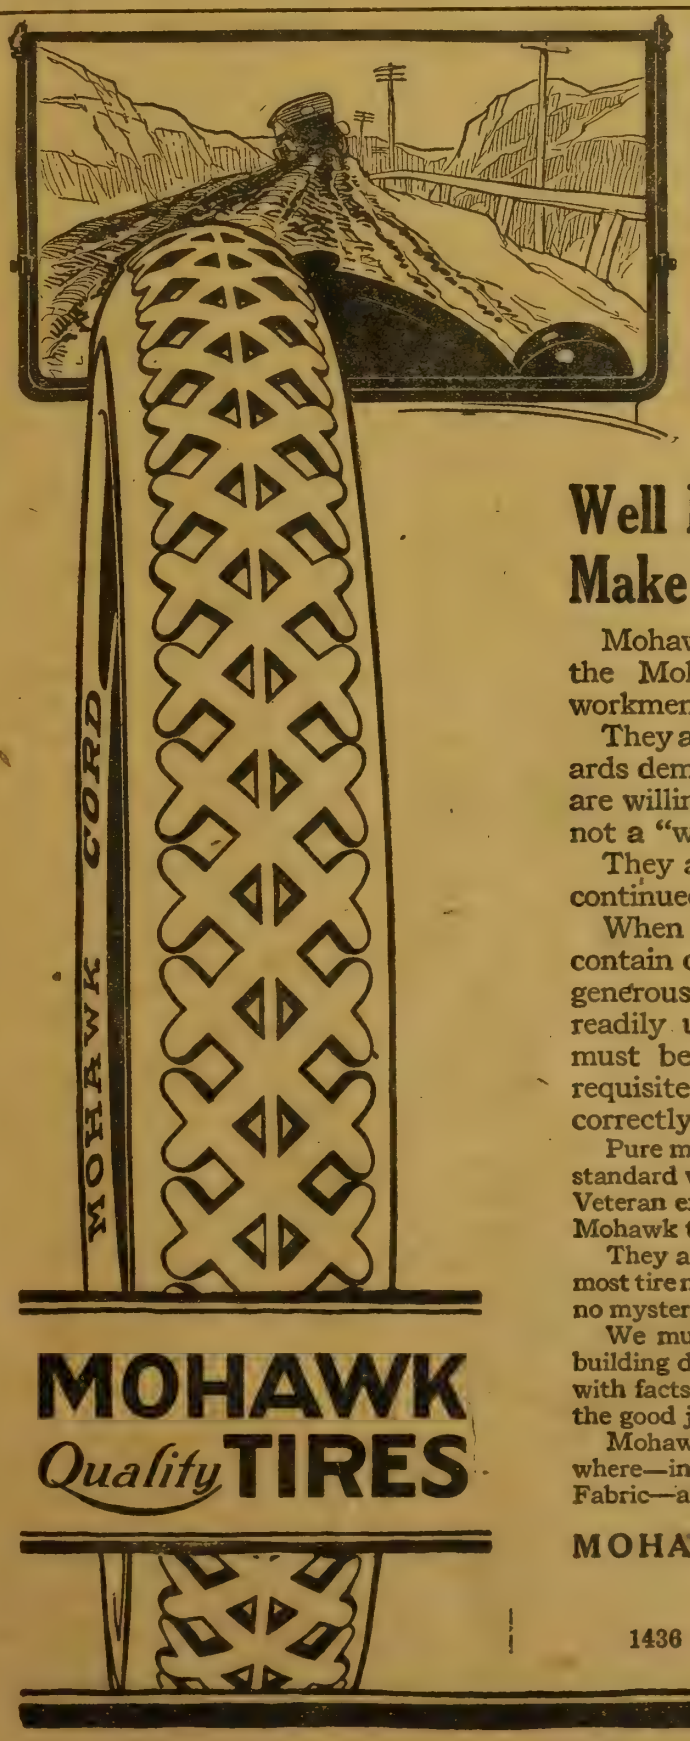
Two cups cooked beans, one cup cooked rice, one cup bread crumbs, one egg, one tablespoon fat, one-half teaspoon salt or one teaspoon if the rice is unsalted, one-eighth teaspoon paprika.

Put the beans through a sieve or grind in a meat grinder. Mix all the ingredients well. Form into a loaf and bake until brown. Or croquettes may be formed, rolled in bread crumbs and browned in the oven. Baste frequently with small amounts of liquid containing a tablespoon of fat to a cup of hot water.

If you don't "know beans" try these recipes and find out how good they are.

SUMMER'S SWEETEST GIFT

Bluff March unlocked the earth's closed door,
And swept the ceiling and the floor;
April, with tears from her sweet eyes,
Washed clear the windows of the skies;
May laid the carpets trim and neat
All blossom strewn for dainty feet;
Gave each gaunt tree a brand new suit;
And trigged him fine from head to foot;
Set mating birds to weaving rare
Heart harmonies upon the air;
Unsealed her hoarded nectaries
To scent the gales and call the bees;
And then, when all seemed sweet to see,
And just as bright as bright could be,
Slow stepping to the brooklet's tune,
In royal progress comes Queen June,
And beauty's wondrous wealth discloses
In Summer's sweetest gift of roses.
—Selected.



A LITTLE GIRL'S TEA PARTY

I had a little party
This afternoon at three.
'Twas very small;
Three guests in all,
Just I, Myself and Me.

Myself ate up the sandwiches,
While I drank up the tea;
'Twas also I
Who ate the pie,
And passed the cake to Me.
—St. Nicholas.

GOD IN NATURE

"There's part o' the sun in an apple,
There's part o' the moon in a rose;
There's part of the flaming Pleiades
In every leaf that grows.
Out of the vast comes nearness,
For the God whose love we sing,
Lends a little of his heaven
To every living thing."

Most troubles are best eliminated at the SOURCE. Bad roads are the SOURCE of much UNNECESSARY tire expense. ARE YOU BOOSTING GOOD ROADS?

Well Paid Mohawk Builders Make Longer Lived Tires

Mohawk tire builders—the men who make the Mohawk tire *by hand*—are expert workmen and draw expert workmen's pay.

They are well paid because Mohawk standards demand the *best* workmanship and we are willing to pay for men whose trade is not a "work" but a profession.

They are paid well enough to insure their continued, undivided interest and best efforts.

When you realize that Mohawk tires contain only the purest materials and more generous quantities of these — you can readily understand why Mohawk builders must be leaders. Their efficient work is requisite to the satisfactory completion of a correctly started product.

Pure materials. More of them—an extra ply of standard weight fabric, for example. Hand made. Veteran expert builders. Those are the reasons for Mohawk tire quality.

They are not the reasons you hear offered by most tire makers. No secret processes, for example—no mysterious methods.

We much prefer, knowing that secrets in tire building do not exist today, to supplant mysteries with facts, leaving the results of our arguments to the good judgment of the buyer.

Mohawk tires are handled by good dealers everywhere—in ribbed and non-skid treads—Cord and Fabric—and also in extra ply, hand made, Ford size.

MOHAWK RUBBER COMPANY
AKRON, OHIO
Branch:
1436 Van Ness Ave., San Francisco, Cal.

Los Angeles Markets

Los Angeles, June 4, 1919.

BUTTER

Butter, creamery extras, Produce Exchange price 59 lb.; prices to retail merchants in 1-lb. squares, 59@60.

Dairy exchange prices last week on extras:

May	21	22	23	24	26	27
'19 ...	60	60	61	60	59	59

CHEESE

Brokers' prices.

California fresh, lb., 30; price to retail merchants, 32-33.

EGGS

Fresh extras, Produce Exchange closing price, 47 doz.; price to retail merchants, 50 doz.; case count, Produce Exchange closing price, 45 doz.; price to retail merchants, 47 doz.; pullets, Produce Exchange closing price, 45 doz., price to retail merchants, 47.

Dairy exchange prices last week on extras:

May	21	22	23	24	26	27
'19 ...	51	51	50	49	49	47

POULTRY

Prices to producers: Hens, 36; broilers, 25@28; fryers, 30; roasters, 40; old roosters, 14 capons, 42; ducks, 27; ducklings, 33@34; geese, 25; turkeys, 35@40; squabs, 45.

Belgian hares, 15.

LIVE STOCK

California steers sold yesterday, June 3, on the Chicago market indicates the degree of weakness throughout the entire country on all classes of beef cattle at this time. Prices paid for these cattle in Chicago being $10.00 to $12.75 would be equal to $7.50 to $10.25 on the Los Angeles market as the shipping charges to that point amount to about $2.50 per cwt. Local market is weak at the prices quoted.

Hog receipts are more liberal than a week ago. The market is bordering on a decline of at least 50 cents per cwt., say the local packers. Feeder hogs are in great demand and the available supply seems to be very scarce.

Lambs are being received on this market in larger quantities than the market can absorb. The market is very weak.

All sheep stock is also weak in sympathy with lambs.

The Eastern markets are paying good prices for California sheep and lambs. Chicago sold today 1000 69 pound California lambs at $18.85; 1100 head 56 pound lambs, $18.50; 231 feeders at $14.75.

Kansas City sold today 1500 California sheep, $10.85 to $12.50 including yearlings.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Cattle:
Good steers .....10.00@11.00
Medium steers .....9.50@10.00
Common steers .....8.00@9.00
Good cows .....9.00@9.50
Medium cows .....7.00@8.00
Common cows .....5.00@6.50
Hogs No. 1, 175-225 lbs. .....18.50@19.00
Hogs No. 2, all other weights..17.00@17.50
Sheep:
Lambs No. 1, 55 to 75 lbs.....13.00@13.50
Lambs No. 2, 65 to 80 lbs ....12.50@13.00
Wethers .....10.00@11.00
Ewes No. 1 .....8.00@9.00

POTATOES AND ONIONS

These are the actual prices obtained June 3 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Potatoes: Demand and movement slow, market dull. Stockton Burbanks, quality generally good, sacked per 100 lbs., extra fancy 2.75@2.90, Idaho Russets, quality and condition fair 2.50@2.75. Oregon Burbanks, fancy 2.50@2.75. New stock: Homegrown Red Rose and White Rose 1.25@1.35 per lug box.

Sweet potatoes: Lug box best 1.25@1.35.

Onions: New crop, homegrown Green Onions 50 per dozen small bunches. Imperial Valley and Coachella Valley, Wax and Yellow Bermudas, standard crates, best 4.25@4.50, poorer 3.50 up., Stockton Red Weathersfield 6.00@6.50.

Carlots: Coachella district — carlots f. o. b. usual terms—hauling light, market firm, no change in prices. Demand good. Yellow Bermudas, standard crates, and Crystal Whites 3.50@3.75.

VEGETABLES

These are the actual prices obtained June 3, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Asparagus: Northern, green, local fancy, 11@12; fancy, 10@11.

Beans: Local Wax, 9 lb.; Kentucky Wonder, best 9@9½.

Beets, doz. bunches, 25@30.

Cabbage: Sales to retailers, best, cr. 2.25@2.50.

Carloads: Hauling light. Demand slow, market unsettled, prices lower. Quality and condition generally good, mostly medium size, some large. Some sales on wire orders. Carloads f. o. b. usual terms, Charleston Wakefield, Alabama cr., 2.50. Carloads f. o. b. cash track—2.30@2.40, some shipments rolled unsold.

Carrots, doz., 40@45.

Cucumbers, Signal Hill, box of 2½ doz., 1.00@1.25; Imp., 1.00@1.25.

Corn, sweet, per doz., 1.25.

Lettuce: Sales to retailers, best lettuce in cabbage crates, 75@85.

Parsley, doz., 10.

Peas: Local (San Pedro) best, 10@12.

Radishes: Round Red 20 per dozen bunches. Long White, 40 per dozen bunches. Long Red 25 per dozen bunches.

Rhubarb: Local Giant Cherry, 1.25@1.50 per packed box. Strawberry, fancy 1.00@1.35 apple box.

Spinach, doz., 25.

Squash: Imperial, per 4 basket crate, 1.00@1.10.

Tomatoes: Imperial, 4 basket crates, 2.25; small, 2.00; lug, 3.25@3.50.

Turnips, doz., 45@50.

FRUITS

These are the actual prices obtained June 3, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: Yellow Newtons, fy. medium size, 4.50@5.00; loose, 9@11 lb. Oak Glen, Rome Beauties and Pearmains, 3.75@4.00.

Apricots: 4 basket crates, 1.50@2.00; bulk lb., 8@19.

Blackberries per tray of 15 baskets, 2.25@2.40.

Cantaloupes: Imperial Green meats, standard 45s, 5.25@5.50; flats, 12s and 15s, 2.00@2.25.

Cherries: Northern Black Tartarians, 13@14; Governor Wood, 9@10; Bings, 17@18; Beaumont district, Black Tartarians, 12@14 lb.

Figs, per 10 lb bx, 1.75@2.00.

Gooseberries, 10@11 lb.

Loganberries, basket, 20@25.

Raspberries, local, 12½@15 per basket.

Peaches: Alexandrias, per 4 basket crate, 1.75; bulk, 9@10.

Pineapple, lb., 17½@18.

Strawberries, 4.50@6.00 per 30 basket crate.

Watermelons; Imp. lb., 5.

Lemons: fy. packed, 4.25@4.50; local pack 3.00@3.50; loose, some tree ripe, 2.00@2.50.

Oranges: Valencias, medium fancy, 5.00@5.50, local pack, 3.50@4.00.

Grapefruit: Local fy., 3.00@3.50 bx.; poorer, 1.75@2.25.

BEANS

Demand and movement moderate, market firm, little change in prices. Carloads f. o. b. usual terms—pool prices, sacked per 100 lbs., choice, recleaned basis, Henderson Bush 7.50, warehouse cash to growers—best, choice recleaned, Small Whites, sacked per 100 lbs., 6.30@6.40; Large Whites, sacked per 100 lbs., 6.00@6.25; Blackeyes, sacked per 100 lbs., demand and movement good, 3.40@3.50; Tepary, sacked per 100 lbs., 2.50@3.00.

HONEY

Too few sales to establish market.

HAY

Quotations by Nichols - Loomis Company. Following are prices to growers, f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices:

Tame Oat .....16.00@20.00
Barley .....14.00@18.00
Alfalfa .....14.00@18.00
Wheat or Barley straw .....6.00@8.00

The Alfalfa Growers of California, Inc., 525 Central Bldg., Los Angeles, furnishes the following quotations on alfalfa hay. Below are its selling prices to carload purchasers f. o. b. cars Los Angeles on the new 1919 crop:

No. 1 dairy 26.00

The Sahara Drier

IF YOU grow Fruits or Vegetables our Drier is your Crop Insurance. Banks thrive and grow rich by a small margin of profits. Banks protect themselves against losses. The farmers persist in taking chances of losing their crops and entire year's work. The thrifty farmers are setting about this year to stop these losses and protect their years of labor and investment.

JUST A FEW of the Growers who know what they are doing—these men have just placed orders for "SARAHA DRIERS." Look them over—they are the leading farmers in their respective districts—they make few mistakes:

D. B. Gray, Fowler, Calif.—Raisins.
Chelini & Reith, Sonoma—Prunes.
Sanitary Fruit Co., Red Bluff.—Prunes.
D. D. Erwin, Chico.—Prunes.
Piru Land Co., Piru, Cal.—(5 Driers) Apricots.
Jos. Feige, Healdsburg.—Prunes, Apples.
H. B. Reed, Chico—(8 Driers) Prunes, Apricots.
Geo. W. Clemson, Owensmouth—(6 Driers).
Kelly Bros., Chico.—Prunes.
G. L. Barham, Chico.—(2 Driers) Prunes.
Anderson-Barngrover, San Jose—(2 Driers).
A. R. Friesen, Dallas, Ore.—Prunes.

There are many others. See our Representatives for catalogue and particulars.

Cameron-McDonald, Chico.
A. L. Bowman, Lodi.
C. F. Moon, Fresno.
Chas. F. Wyre, Napa.
Anderson-Barngrover, San Jose.
Jno. P. Davisdon, 305 Security Bldg., Los Angeles.

FRESNO POLAND-CHINA BREEDERS

(Continued from Page 786.)

Constitution and by-laws were adopted and the following were elected officers: President, Albert Bucklin, Fresno; vice president, A. J. Van Cleef, Riverdale; secretary-treasurer, Walter C. Ficklin, Fresno; directors, Fred Gatewood, Fresno, and E. R. Eichner, Selma.

The object of the association is the producing of more and better hogs of the Poland-China breed, and to secure the highest market prices for the product. William Bernstein of Kings County at the close of the meeting announced plans for a "Pork Day," to be held at Hanford early in November, which is to be on an elaborate plan, when exhibits of swine will be had from all parts of the valley, and a demonstration given of a grade hog and a pure bred one to show the difference in the value of pure breeding.

Book Review

NEWER KNOWLEDGE OF NUTRITION

"Newer Knowledge of Nutrition, the Use of Foods for the Preservation of Vitality and Health," by Professor E. V. McCollum, School of Hygiene and Public Health, the Johns Hopkins University, published by the MacMillan Company, New York, at $1.50.

There was never so much interest in nutrition and the securing of the greatest values in foods as today. Many Pacific Coast dairymen will recall the recent visit of Professor McCollum, at which time he made addresses on the values of milk, in fact of all dairy products, in the upbuilding of the human race. These dairymen will doubtless be glad of the opportunity of renewing the information given by Professor McCollum in these addresses. This may be done by securing this valuable book of 200 pages which may be secured from the MacMillan Company. Professor McCollum says in his preface:

"The investigations of the last few years have, fortunately, led to great advancement in our knowledge of what constitutes an adequate diet. Such knowledge can, if rightly applied, greatly assist in enabling us to make use of our food supply in a manner which will avoid mistakes sufficiently serious to become reflected in a lowering of our standard of public health. It seems certain that pellagra is a sequel to the adherence to a faulty diet for such a period as to materially reduce the powers of resistance of the body to infection, and reasons are presented in support of the view that there is a much closer relationship between the character of the diet and the incidence of tuberculosis than has hitherto been believed."

There are seven chapters in the book touching upon the biological method for the analysis of a foodstuff, scurvy, vegetarian diet, diseases referable to faulty diet, considerations which should guide in planning diet, etc.

FIG OUTLOOK 1919

The coming season will see the largest planting of figs in the history of the state. Many investors in the southern part of the state are planning fig acreages throughout the San Joaquin Valley from Madera to Bakersfield. Acreages in Madera, Merced and Stanislaus Counties will be very large, while Fresno will maintain its present leading position as a fig producing county. Increases in fig growing are noted in Tulare County and the industry has been given impetus in Kern County.

Eventually California figs will dominate the country, if not, indeed, the world market!

PREPARING FOR DRYING

The California Dried Products Company of San Francisco, manufacturers of the "Sahara Drier", report a great deal of interest developing among the farmers who are setting about this year to protect their crops from adverse weather conditions such as were experienced last year by the California growers.

During the past week some of the most prominent growers of California had placed orders for driers. Among them H. B. Reed, one of the largest prune and apricot growers of Butte County, bought a battery of eight units; Piru Land Company, Piru, five driers; Geo. W. Clemenson, a big peach and apricot grower of Owensmouth, six driers; also A. R. Frieson, a large grower of Dallas, Oregon. Eventually every grower will find need for a drier of some kind as part of his farm equipment.

WEATHER CONDITIONS

San Francisco, California, May 31, 1919.

30 HEAD
St. Mawes-Rosaire Olga Lad Blood Lines

St. Mawes has 20 daughters in the R. of M., including St. Mawes Poppy, 952.28 pounds fat; St. Mawes Susy, 873.60 pounds fat; St. Mawes Koffee Violet, 777.05 pounds fat; Boise Queen, 745.63 pounds fat; St. Mawes Blossom, 713.84 pounds fat. While comparatively a young bull, Rosaire Olga Lad has 31 R. of M. daughters and more qualifying as fast as tested. Among his daughters are St. Mawes Beauty, 773.91 pounds fat; St. Mawes Tisha Baby, 731.36 pounds fat; St. Mawes Susy Olga, 698.49 pounds fat. On our farm we also bred and developed the four highest record full sisters of the breed (daughters of St. Mawes and Susy of Forestdale), as follows:

St. Mawes Susy, 873.63 pounds fat.
Lucy of Pleasant View, 625 pounds fat in 10 months.
Susy's Twin Maiden, 675.75 pounds fat.
St. Mawes Blossom, 713 pounds fat.

Many of their descendants are included in this sale, also many granddaughters of St. Mawes and daughters and granddaughters of Rosaire Olga Lad, many with R. of M. records up to 698.49 pounds fat, and a very choice lot of heifers and heifer calves, as well as our junior herd bull, Poppy's St. Mawes (dam, St. Mawes Poppy, 952.28 pounds fat, sire, Rosaire Olga Lad), who already has eight daughters in the R. of M.

Catalog will be published giving complete description of offering. Those that mention this paper in requesting catalog will also receive picture of the four highest record full sisters. Send catalog request to sale manager.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 811.

Angeles and Cleveland Forests Patrolled by Airplanes

THE Angeles and Cleveland national forests in Southern California are now patrolled daily by airplanes. The service began on June 1. On the same day observations covering a large part of the Angeles national forest began from a captive balloon stationed over the army balloon school near Arcadia, in Los Angeles County.

Two routes of airplane patrol work will be operated from March Field, 12 miles southeast of Riverside. Two planes will be used on each route, the routes will each be approximately 100 miles long, and each route will be covered twice a day.

This will be the beginning of experimental work in which the adaptability of aircraft to forest patrol work is to be thoroughly tried out. If the tests should prove successful it is expected that the airplane patrols will be extended before the end of the 1919 season, and that airplanes will become a permanent feature of the ceaseless battle against fires in the national forests.

The airplane routes from March Field, in Riverside County, will afford an opportunity to survey about 2,000 square miles in the Angeles and Cleveland national forests. The airplanes are not equipped with wireless telephone apparatus of such a nature that they can communicate with the ground without the installation of expensive ground instruments. Warnings of fires will be transmitted by means of parachute messages dropped over a town, the finder to telephone them to the forest service; by special landings made to report by telephone; and by returning to the base and reporting from March Field direct to the forest supervisor.

Fires will be located and reported by squares drawn on duplicate maps, one to be in the possession of each airplane observer and another to be in the office of the forest supervisor.

The observation balloon over the Arcadia field is to be maintained at an elevation of about 3,000 feet from 7 a. m. until 2.30 p. m. each day. The student detachment-learning observation, now stationed at Mount Wilson, also will render fire lookout service. Reports of fires from both the balloon observer and the Mount Wilson detachment will be telephoned to the army balloon school and transmitted to the forest service office at Los Angeles.

A fire-fighting truck, with ten enlisted men, will be stationed at Arcadia as part of the fire suppression forces and will be subject to the call of the forest service.

PROVIDING FOR BIG WHEAT HARVEST

The railroad administration writes that it is giving careful consideration to the measures necessary for the satisfactory transportation of the anticipated large crops of grains. The department of agriculture estimates that the yield of winter wheat will exceed 900,000,000 bushels. A fair estimate of the yield of spring wheat approximates 300,000,000 bushels. The total yield of wheat this year will in all probability exceed the total of last year by from three to four hundred millions of bushels. No estimate of other grains is of course possible at this time, but barring unusual climatic conditions, it can perhaps be properly expected that the tonnage in grain that will be produced this year will exceed that of last year by a considerable margin.

The stable price fixed last year by the government on wheat naturally provoked a desire on the part of the producer to realize his earnings as quickly as possible, and since a stable price has again been fixed by the government for this year's crop, it is assumed a similar condition will obtain. Last year this economical condition, coupled with more or less disarrangement in ocean tonnage and consequent disruption in shipping, resulted in such an acute situation at the interior grain markets and at seaports that it became necessary to install the so-called "permit system." And it is expected that the system will again be inaugurated with the opening of the new wheat season, and in view of that probability the railroad administration is already preparing the necessary machinery so that it may be prepared to act without delay at the proper time. Conferences have already been held with representatives of the grain corporation.

BIG GRAIN CROP IN IMPERIAL

By A. M. Nelson

WHEN the Imperial Valley grain harvest starts, then the national grain harvest starts. This year Imperial Valley had a carload of wheat, its first, rolling toward market on May 9 and since then the harvest there has been in full swing, proceeding as fast as the threshing equipment would permit.

The wheat acreage in the valley, which heretofore has been less than 10,000 acres, is this year estimated between 40,000 and 50,000 acres. The wheat shortage has led many flouring mills to close or reduce their outputs, and there have been many buyers in Imperial Valley to contract for the valley wheat as the first which will reach the market. Varying premiums over the government guarantee price have been paid, and the valley ranchers will record this year's wheat crop as one of good profit. Figuring on an acreage of 40,000 with thirty-five bushels as an average, the valley crop this year will bring approximately $3,000,000.

Regarding the varieties planted in the valley, W. S. Wilkinson, director of the University of California experiment station in Imperial Valley, says:

"Nearly all of the early commercial plantings were made with either eastern varieties of wheat, which were poorly adapted to our conditions, or with Sonora, whose origin is in the State of Sonora, Mexico. While these varieties yielded fairly well when given the proper conditions, the quality of the grain was not good and the grain was largely sold locally for feeding purposes. Experiments carried on at the experiment station at Meloland gave results which indicated other varieties as superior to those already being grown. Among these the most promising were the White Australian, Defiance, and the Early Baart, all three yielding a grain which is much more in demand by the millers. Of these three, the Defiance is practically free from the attacks of rust. Of these varieties Early Baart has become the most popular, and it is esti-

The Motor Truck a Farmer Would Build

IF FARMERS pooled their ideas for building a practical motor truck that would best serve their everyday hauling needs, it would offer nothing not now found in the International Motor Trucks.

The reason is plain. The International is the result of a thorough knowledge of farm conditions. This Company knows country roads. Ample provision has been made to withstand the strain and stress of highways that place an unusual tax on parts subject to wear. Only the best materials are used, after thorough test. The truck is simple and durable.

International Motor Trucks

will do the work expected of them at a cost farmers can afford. They give a service that is reliable, prompt and economical in the severest test of all—**steady performance in actual daily use.** They have ample power for any emergency and can be depended upon to keep going every day in the year.

Farmers everywhere find an International Motor Truck a source of profit from the outset. It saves time, labor and distance. Markets are brought to the door and better prices are possible for farm produce, which retains all its freshness. The item of return loads is an important one from the standpoints of both business and convenience.

There are four sizes of International Motor Trucks —1,500, 2,000, 3,000 and 4,000 pounds capacity, with bodies suitable for every kind of hauling.

We have a dealer, a branch house, or a service station somewhere near you, where the line can be seen, or we will send full information promptly if you will write us.

mated that of this season's planting, two-thirds is of that variety.

Among the fields harvested in 1917-1918 season it was not an uncommon occurence to find some which averaged fifteen to eighteen, or even up to twenty-five sacks to the acre, or from thirty to fifty bushels. This season even greater yields can be expected with the greater experience in planting and the obtaining of more and better machinery to harvest the crop. This yield, compared with the average of the state for several years past, fifteen to twenty bushels, shows quite an advantage."

GRASSHOPPER WARNING

The following warning is being sent out by the office of the state horticultural commission:

A general survey of the grasshopper situation shows that this pest is now making its appearance in great abundance. In some of the hills certain species are already flying.

Many localities may expect thousands of dollars worth of crops destroyed if the most drastic control measures are not taken up at once. Special warning is given to the farmers in the counties of Tehama, Glenn, Colusa, Yolo, Trinity, Merced, Tulare, Kern, San Luis Obispo, Placer, Stanislaus, Yuba, Sutter, Plumas, Siskiyou, Shasta, Butte, Fresno, Kings, Ventura and Imperial.

Poison the grasshoppers in fields and orchards with a mixture of the following:

Bran, twenty-five pounds; Paris green, one pound; cheap molasses, two quarts; lemons (ground very fine), one-half dozen; water, four gallons. Spread the wet mixture very thinly where grasshopers are present.

SHAFTER FARM BUREAU BUILDS WAREHOUSE AND ELEVATOR

One of the livest organizations of its kind in California, the Shafter farm center in Kern County near Delano, is taking the lead in the movement for cooperative marketing for farm products for grain and corn. Plans were discussed at a recent meeting of this organization, and a considerable sum of money already has been pledged to build a warehouse for agricultural products and for the erection of a bulk grain handling elevator.

N. E. Vandam is the director of the Shafter center. He has recently gathered some statistics which prove that the Shafter farm center products which can be handled through the elevator are sufficient to pay for the installation of such a plant from the saving it will effect in one year.

Grain growers throughout the state have become more and more interested in the plans being urged by such concerns as the Sperry Flour Company and representatives of the college of agriculture of the University of California and others who have been making a study of the grain handling matter, to change over from the wasteful grain sack to the bulk handling system. Metal grain bins and tubular steel elevator, together with grain tight wagons, can handle the California grain crop as it comes from either the combined harvester or the stationary thresher at a minimum of expense of labor instead of the heavy handling of grain in the old fashioned jute sack. Bulk handling is best.

Sierra national forest, which includes 1,700,000 acres, extending from Kings river to Yosemite park is one of the biggest in California. It is being protected from fire by lookouts on the highest points, overlooking vast areas. At the first sign of smoke in the timber, rangers and guards will gallop to spot threatened and if necessary summon help from all the mills within a radius of many miles. Arrangements have been made with all the mills to render assistance by sending out all available men on call from a forest ranger or forestry official.

Forest Supervisor Benedict announces that heavy penalties will be imposed on anyone caught setting fires in the national forest.

There are four causes for forest fires: tourists who cause ten per cent of the blazes through carelessness in dropping lighted matches or cigars; brush burning settlers, thirty per cent; lightning, forty per cent, and incendiaries, twenty per cent.

Apricot Dryers
Save $50 per Ton in Drying Expense By Using The
International Dehydration Machine

Every FRUIT and VEGETABLE GROWER and all CANNERIES should use this approved method without delay. The establishment of an International dehydrator in any community is a mark of progressive distinction. "Fifty-four per cent. (U. S. Government Report) of vegetables and fruit that come to maturity are lost."

If 46 per cent. of the present crop constitutes the prosperity of your community today, what would 54 per cent. IN ADDITION do for the merchant, the banker, the tradesmen and for the producers themselves?—to say nothing of the increased land values—an increase from the present approximately $50 per acre to $250. No industry will add more to the material good and general wealth of the community than a local International Dehydrating company.

Is it not good business to convert all surplus crops into real money? We are prepared to do our part, the market is ready and waiting.

This machine is not a "toy" or a "hot box." It is a real commercial proposition. We completely guarantee the perfectness of our equipment.

SOLD ON PAYMENT TERMS, at the rate of $500 per ton basis.

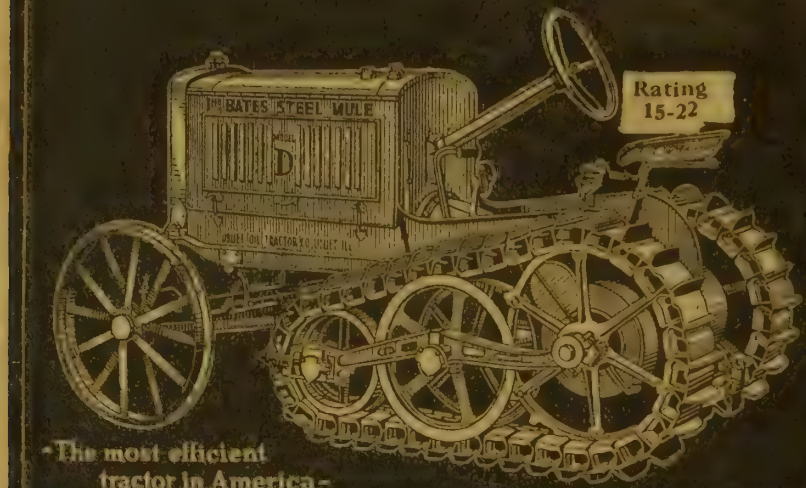
The Standard Oil
ZEROLENE
For Motor Cars

Powerful on Soft Ground



The twin crawlers of the Bates Steel Mule lay a firm runway on the soft ground which runway is held from slipping by twenty-four cleats. This runway has a ground pressure of less than 3½ pounds per square inch and being geared to it, the tractor pulls as big a load on soft ground as it can on firm footing.

The absence of slipping is one of the many factors that go to make the Bates Steel Mule unusually economical in fuel. This feature, combined with the unit construction; Timken roller bearings; hardened cut gears running in oil; and heavy-duty valve-in-head kerosene motor, contributes to the great efficiency of this tractor.

Great Endurance of the Ajax Road King

Confidence with which farmers keep on using the Ajax Road King, we regard as the supreme tribute to Ajax endurance.

The Road King is as good as it looks—and note how its massive tread is braced on both sides by Ajax Shoulders of Strength.

More Tread On The Road

This exclusive Ajax feature is the buttress principle applied to tire construction. Shoulders of Strength buttress the Road King tread — give a wider wearing surface—more tread on the road.

No stronger endorsement of Ajax Tires can be cited than the fact that they are *97% Owner's Choice.* This means that Ajax Tires are never forced on users when they buy their cars. Instead, this big percentage is singled out to replace other tires originally on the cars.

Buy Ajax Tires, Ajax Tubes, and Ajax H. Q. Tire Accessories from your nearest Ajax Tire Supply Depot.

AN IMPERIAL HIGHWAY

There are not many cloudy days in the Imperial Valley even in winter. They give wonder effects when they do come, and are worth a trip across the continent to see. But the best feature of this picture is the highway under the clouds. There are 130 miles of such highway in that valley which less than a score of years ago was absolute desert. A new county bond issue of a million and one-half is contemplated July 1, likewise there will be a $40,000,000 state bond election the same day.

does it pay?

A NEBRASKA rancher located 45 miles from the railroad used to spend four days on the road with a team going and returning from his shipping point. With his International Motor Truck, he makes the trip in a day and saves three days for productive work.

An Iowa farmer living ten miles from town required the greater part of a day to make a round trip haul with horses. With his

International Motor Truck

he makes the trip in about three hours. The rest of the day he has for productive work. To the farmer living closer to market, the saving accomplished with an International Motor Truck is relatively as great.

This truck is built by a Company that knows farm and country road conditions. The engine is a simple, heavy duty type, transmitting ample power to the famous International internal gear rear axle, that converts it into mileage at lowest cost.

When need arises for repairs, or an adjustment, an International owner has always at ready command a service organization that is thorough and complete. This is an important consideration to the farmer, whose hauling must so often be done at just a certain time.

Figure up the time you and your help spend on the road in the course of a year. Two-thirds of that time is the approximate number of days an International Motor Truck will save you for productive work. There is a style of body and size of truck to meet practically every hauling requirement. Write for full information.

Opening Guns for Unified Agricultural Organization

By R. P. Royce

THE opening guns of Organized Agriculture were fired at a meeting of several hundred farmers at Modesto on June 6. The caliber used for the opening attack can be guaged by the men who did the firing. There were A. A. Elmore, president of Washington State Farmers' Union; John A. McSparran, master of the Pennsylvania State Grange; Dr. W. J. Spillman, formerly of the United States department of agriculture; Milo D. Campbell, president of the National Federation of Milk Producers; Charles S. Barrett, national president of the Farmers' Union and Senator Thomas P. Gore, chairman of the senate agricultural committee.

The searching barrage laid down by these hard hitters disclosed the lamentably weak state of the farmers defenses, and at the same time the way was pointed out for the farmers to strengthen their position so as to withstand all attacks and to place themselves in a position to assert and demand a fair deal at the hands of every agency. The answer is simple —organization and cooperation—increased support of the many organizations and cooperation between these various organizations for their mutual benefit.

In other words, it is proposed that the farmers apply the same tactics used by the allies in winning the war —unified command and the bringing of all organizations together under one parent organization. Labor has federated the many specialized unions and created the American Federation of Labor and that organization stands for all labor. It is proposed that the National Board of Farm Organizations serve the farmers in the same way. The idea is big—but agriculture is the biggest industry. To the man who suggests that it will never be possible to organize all the farmers, John McSparran stated that it was not necessary. He declared that organized labor constituted only about 15 per cent of the total, yet that 15 per cent dictated policies for the other 85 per cent, and he further stated that the many farm organizations represented between 10 and 12 per cent.

The trouble is not that the farmers are unorganized, but that they have lacked a central organization that can represent all. The National Board of Farm Organizations was created to fill this need. It is an association of the following organizations.

Farmers' Educational and Cooperative Union of America; Farmers' National Congress; National Agricultural Organization Society; National Conference on Marketing and Farm Credits; National Council of Farmers' Cooperative Associations; National Dairy Union; Pennsylvania Rural Progress Association; National Milk Producers' Federation; Federation of Jewish Farmers' of America; Farmers' Society of Equity; American Association for Agricultural Legislation; Intermountain Association of Sugar Beet Growers; Corn Belt Meat Producers' Association and the Pennsylvania State Grange.

It is expected that eventually practically all organizations will affiliate and then vital problems affecting agriculture can be handled to the interests of all. A knowledge of the power wielded by the American Federation of Labor suggests the mighty influence a big representative farmers' organization would have. Much of the influence of the American Federation of Labor is due to the fact that they are constantly "on the job" at Washington and have erected a permanent building there for their headquarters. The National Board of Farm Organizations plans to build at Washington a "Temple of Agriculture" and have formulated a plan for financing that involves raising a fund of $8,500,000. The fund will be used to erect and endow a permanent headquarters—$1,250,000 to be expended on the building. The money will be raised by popular subscription and it was partially for this reason that the Modesto meeting was held.

Emphasizing the paramount need for an organized agriculture, McSparran declared that the time had come when the American farmer must discard the idea that he is "independent" and has no need for organization.

McSparran gave it as his opinion that the farmers' predicament at the present time is a direct result of this old "independent" attitude of mind and stated that until the American farmer reached a realization that only through cooperation and organized effort could he hope to cope with organized forces he would continue at the mercy of them. American agriculture is at a critical period, he said. The average farmer is not making a financial success and tenancy is increasing at an alarming rate. The hope of the nation has always rested on the clear thinking farmer and unless conditions improve and the farmer is able to secure a higher standard of living, tenancy would increase and the farms be operated by a class of tenants who will be satisfied with a lower standard of living—such a class will not strengthen the nation.

The only way to prevent the evils of tenantry is to make farming attractive and profitable and unless the farmers work and act together they can not expect to receive adequate returns for their labor or investment.

McSparran was followed on the program by Dr. W. J. Spillman, recently resigned chief of the farm management department of the United States department of agriculture. Spillman declared that the farmer was entitled to the same standard of living enjoyed by the city man who operated an enterprise of the same capital investment. Furthermore, Spillman insisted that the farmer's labor return should provide a salary sufficient to insure such a standard of living and that in addition his business should return a fair rate of interest on his investment, and that the man operating on borrowed capital should be able to pay his interest charges and secure a decent profit. Spillman only contended for a fair profit and stated that the purpose of organization should not be construed to mean excess profit.

The only way to insure a satisfactory standard of living for the farmer is to make it possible to market his products on a basis of production cost. Spillman argued that the problem of production costs was the biggest problem the American farmer had to solve and that a knowledge of such costs was fundamental to the structure of agriculture. With a knowledge of the various production costs, and an organization to work through, the farmer would be in a position to inform the consumer as to what it cost to produce his products and to enforce a price based on them.

Using milk as an example, he stated that when the government began this cost investigation about 12 years ago no one knew anything about the cost of producing milk. Four of the best managed dairy farms in Wisconsin, Michigan, Pennsylvania and North Carolina were selected, and when the data gathered was checked up it was found that all four were losing money. Even at the beginning of the war, when mounting feed and labor costs caused the dairymen suplying milk to New York to act for increased prices based on cost of production, no one really knew what would be a fair price. The producers were told by the distributors and consumers that if the dairyman had never gotten cost for his products he was not entitled to it then. It took a strike to educate the public to the justice of the producers' demands.

Spillman urged that the agricultural interests encourage widespread investigation to determine production costs, and then insist that marketing be based on that proposition. Spillman charged that when the government fixed the price of wheat at $2.20, thereby causing a billion dollar loss to the farmer, that the price was not based on production cost, but was established at a figure that would give labor a five cent loaf of bread. Had the farmers been organized and armed with production figures the government would have listened to them.

Senator Gore stated that his experience as chairman of the senate committee on agriculture had convinced him of the advisability of agricultural organization, and he agreed with Spillman that a knowledge of production costs was fundamental to the farmers' welfare. He frankly stated that his observation had been that the farmer was lucky if he got justice, and that one reason why he opposed fixing a price on wheat was because he knew the farmer would get the worst end of the deal. To indicate how unorganized agriculture was at the mercy of organized interests he cited the instance of his attempt to force through a pure feed amendment calculated to protect the buyer and that it was defeated by the organized manufacturers. He also declared that had agriculture been organized "congress would never have passed the fool daylight saving law."

Milo D. Campbell, president of the National Milk Producers' Federation, threw considerable light on the present fight being waged by certain interests against the milk producers of this state. He said the fight was "old stuff" — that the identical fight had been made against similar organizations in other parts of the country. He said that the California Milk Producers' Association was the best organization of the kind in the United States and he urged that the members stand solidly behind the officers and that they be not enticed away by seemingly better prices offered by privately owned competing plants. Campbell said such tactics were employed elsewhere in an effort to break up cooperative enterprises and that the increased prices would be maintained just long enough to accomplish such ends. He paid a very high tribute to James M. Henderson, Jr., president of the Associated Dairymen of California, by saying that while he had never met Mr. Henderson, he knew of his work and he wished that there was such a man in every state.

Campbell said that an effort would be made to amend the Clayton act so as to more definitely exempt farmers' organizations from coming under its operation.

Charles S. Barrett, president of the Farmers' Union, who was sent to the Peace Conference to represent the cause of American agriculture, told of his successful trip.

A resolution was adopted to submit an amendment to the covenant of the League of Nations to establish an international bureau of agriculture.

Other speakers on the program were: J. J. Hardie, president of the California Farmers' Union; A. A. Elmore and Maurice McAuliffe, president of the Farmers' Union of Kansas.

Agricultural News Notes of the Pacific Coast

Northern California

Alameda County farm bureau announces sufficient labor to meet all needs in that county.

Roseville center of the Placer County farm bureau, is working for unionization of rural schools.

The Solano County horticultural commissioner is destroying weeds along county highways with sprays.

Number one Bartlett pears will command $85 per ton f. o. b. point of shipment is the report from Sacramento Valley.

Escalon, San Joaquin County, is making much of its alfalfa into alfalfa meal. Several hundred tons have been shipped.

Rice growers of Glenn County are taking steps to form an organization to affiliate with the Pacific Rice Growers' Association.

Seven to one is the result of the vote for good roads bonds in Sonoma County; the plan calls for bonding the county for $1,640,000.

Commissioner Gould of Yolo County has reports from various sections of the county that grasshoppers are destroying young almonds.

Yuba County is planning for a general squirrel killing campaign under direction of George W. Harney, county horticultural commissioner.

Livermore Valley, Alameda County, reports immense grain and hay crops. Heads of grain are well filled. "All grain is bright, firm and plump."

Sacramento Valley rice lands have greatly increased in value because of its being shown that wheat does well on such lands rotating with the rice.

The Chico-Nord-Cana irrigation district, proposed for Butte County, is being seriously discussed by producers whose lands come under the ditch.

Sonoma County wool growers report sales ranging from 57 to 61½ cents. There seems to be a slump in the wool market, however, and all buyers have been called off.

Anthrax is the cause of the death of a 14 year old girl on a ranch in Dixon, Solano County. Yolo County stock is suffering severe losses because of this disease.

Growers who have contracted their peaches for a term of years are again asking the canners to advance prices to a level more in keeping with present day expense of production.

The state highway commission at several points between Willows and Colusa is requiring rice growers to pump the water which overflows into the highway back behind their levees.

Local meetings of the Tehama County farm bureau will be held at Richfield, June 16; Corning, 18; Bend, 20; Los Molinos, 23. Proberta meetings are postponed until harvest is over.

Some San Joaquin County table grape growers are discussing the labor situation and urging the use of the women's land army, claiming reduced cost even if it is necessary to employ men to carry lug boxes.

A delegation of Colusa County raisin growers has gone to Fresno to ask the association for higher price on Thompson Seedless as the price fixed, they say, is not in proportion to the high price of labor, shook and other material.

Central California

Tulare County reports swarms of grasshoppers.

Stanislaus County's barley is now being harvested.

Several San Joaquin packing houses are busy packing raisins.

Tulare County will hold its agricultural fair at Visalia, October 13-18.

A 17,000 acre tract at Planada, Merced County, it is announced will be planted to figs.

Grape vines show immense setting of grapes in the Lodi section of San Joaquin County.

At the farm bureau fat hog sale at Tulare $17.80 was top price, total sales amounting to $14,133.77.

The Madera Fruit Growers' Association has its packing house ready for the first fruit shipments.

Madera County's Poland-China breeders contemplate the organization of a county breeders' association.

Stanislaus County's fat hog auction at Modesto resulted in total sales of $5640. The toppers went for $17.45.

Steps are being taken to form an irrigation district of 15,000 acres in the counties of Madera and Merced.

Manager Niswander of the Peach Growers' Association estimates that this year's crop will reach 40,000 tons.

Thompson grape growers near Exeter, Tulare County, report sales which will aggregate close to $200 per acre.

Horticultural Commissioner Marchbank of Madera County reports splendid crops in vineyards and orchards of the county.

The Tulare County Beekeepers' Association announces that 20 cents per pound has been set as the price for orange honey.

Governor Stephens has signed the Irwin irrigation bill which permits the formation of an irrigation district by a majority vote.

Farmers of Shafter, Kern County, propose to organize and secure irrigation for the land. Two separate propositions are under consideration.

The rodent control division of the state commission of horticulture is working on extermination of gophers in orchards of Santa Cruz County.

The amount of sub-irrigated land which has been ruined by high land irrigation ditches is greatly decreasing and irrigation of such lands may again be necessary.

Ahwanee Valley, Madera County, now has one farm center instead of three as formerly, the larger organization proving more effective. J. A. McPetters is president.

A trainload of prime steers was recently shipped by Roland Hill of Bakersfield to Kansas City. The shipment was under the direction of the California Cattlemen's Association.

Farm bureau meetings in Stanislaus County: Wood Colony, 16; Hickman-Waterford, Waterford school house, 18; Fairview, 20; Orange Blossom, 23; Claus, 25; Ceres, 26; Patterson, 27.

Grain growers in the "Lake Section" of Kings County estimate the present season's harvest as by far the greatest in the history of that section. The wheat output will be close to a million and a half sacks.

Southern California

Orange County planted nearly 40,000 acres to Lima beans in 1918.

Orange County is voting on bonds for a harbor at Newport Bay.

The Imperial Valley Milk Producers' Association will build a $50,000 creamery.

Riverside County farm bureau is now to have a home demonstration agent.

Walnut growers are making a thoroughgoing fight on walnut moth and aphis.

California produced last year 38,924,471 pounds of walnuts, valued at ten and half millions.

The California Growers' Association is asking for suggestions for a brand name for its canned fruits.

Palm Springs, Riverside County, began shipping ripe apricots to the Los Angeles market in May.

J. E. Wherrell of Riverside has returned from a trip East where he purchased pure bred dairy stock, mostly Jerseys.

Pruning demonstrations were given by the farm adviser and experts from the college of agriculture at Elsinore, Riverside County, last week.

The Chamber of Commerce of northern San Diego County has acquired title to the Reche Grove in Fallbrook to be used as a permanent park.

A reclamation district is being formed in Riverside County to drain lands near West Riverside. The improvements will cost about $40,000.

The road from Mecca, Coachella Valley, to Brawley, Imperial Valley, is being improved and will make more attractive travel from Los Angeles.

Orange County reports its acreage of oranges doubled during the past ten years, while the increase in lemon acreage is much more than doubled.

Work has begun on the flood control dam in San Dimas Canyon. Work has also started on the impounding dam at Devil's Gate between Pasadena and La Canyada.

Dr. J. C. Whitten of the state university has been giving a series of demonstrations of "long pruning" of deciduous fruit trees in orchards of Riverside County.

The membership campaign started by the Lima Bean Association is securing large additions to its membership roll, the largest number being reported in Orange County.

San Diego claims that at River Gap, six miles east of Mission San Diego, can still be seen the dam built by Father Junipero Serra in 1774. She claims this is the earliests irrigation project in America.

The Imperial Valley Long Staple Cotton Growers' Association is discussing formally abandoning the association or discontinuing its activities for one year. Members claim it is not receiving support sufficient to justify continuance.

Brawley cantaloupe shipments are now away above the hundred per day mark. One shipper, anxious to get the first cantaloupes out of Imperial Valley, offered a long price for the first crate delivered. Fortunately the horticultural commissioner's inspector was on the job, and the shipment was prevented because of immaturity.

The Coast and General

The melon acreage of Indiana has been materially increased this year.

A tractor demonstration was held at Mesa Experiment Farm, Mesa, Arizona, May 24.

Sweet potato storage warehouses in Georgia and Louisiana have been remarkably successful.

Prune growers of Douglas County, Oregon, have formed an organization capitalized at $100,000.

Blackberries are very plentiful in the Houston, Texas, market and are bringing from $1.50 to $2.50 per crate.

Cantaloupe acreage in the Rocky Ford district of Colorado is increased 15 to 20 per cent over last year's plantings.

The Yakima and Wenatchee Valleys of Washington will, it is estimated, this year ship about 29,000 carloads of peaches.

The first straight car of Georgia peaches to reach New York arrived May 20. They were Mayflowers and sold at $5.50 per crate.

The United States bureau of crop estimates' report for 1917 estimates the value of poultry and egg products at twice the value of sheep.

The Arizona corporation commission has ordered the Southern Pacific to provide a loading station at Cochise for loading cattle at that point.

About 250 girls were enrolled in the Country Girls Sewing Club of Maricopa County. The winner of the county championship was Miss Ottie Winn.

It is stated that this year's crop of wheat will be worth about $3.38 a hundredweight. The barley crop will probably be worth about $2.50 per hundredweight.

Heavy shipments of beef cattle are now being sent out from the Salt river valley. Most of these go to Kansas City. The average price is $100 per head at Kansas City.

In a recent test at the Mesa Arizona experiment station it was found that wheat treated with formalin contained no smut, while plots untreated contained 55 per cent.

Growers of peas for canning in the district about Rochester, New York, are receiving ten dollars less than they did last year. This year's price is $55 per ton for shelled peas.

Hood River Valley, Oregon, apple growers are finding that they secured good advertising from apples sold to the government for consumption by the expenditionary forces in France.

It is stated that the herd of elks on Sitgreaves National Forest of Arizona have now increased to between 300 and 500 in number. Some of the settlers in that region are complaining of their depredations.

A representative of the United States weather bureau is to select a location for an observatory for bolometric measurement of solar radiation, somewhere in southern Arizona or southeastern California.

Ed Stephens, secretary of the livestock sanitary board in Arizona, believes that he has worked out a solution of the problem of maverick calves. His plan is to gather all the mavericks in a given district and divide them pro rata according to the number of cows owned by cattlemen in the district.

Good Roads for the Farmer

By Arthur L. Dahl

NOTHING succeeds like success. Every turn of a snowball adds to its bulk, and the more we have the more we get. There are a lot more similar sayings, and all of them are more or less true.

These are prosperous days for the farmer. Prices are high for all food products and the demand is greater than the supply. Modern machinery is taking the drudgery out of farm work, and these mechanical farm hands are overcoming the labor shortage which resulted from the war. The automobile has enlarged the rural world, opening up new avenues of enjoyment and culture, besides enabling the farmer to transact his business in the shortest possible time. Now, in addition to his present advantages, he is to be given good roads.

This does not apply to California alone, where popular sentiment in favor of improved highways has always been strong, and our main thoroughfares are now better than the average in other states, but it applies to all parts of the country, for the appropriations available for road building during this and succeeding years are now in excess of half a billion dollars, of which the federal government has appropriated about half, and the rest comes from bond issues and other appropriations of the states in which the work will be done.

The national program for good roads is made possible by the passage, in 1916, of the Bankhead road act, now known as the federal aid road act. It provided appropriations out of the federal treasury, to be matched by equal sums from the states, for the construction of roads, all work to be done under the direct supervision of the state highway departments of the respective states. The federal government merely cooperates with the local highway departments in formulating a definite system of public highways in keeping with the intention of congress in appropriating public moneys for road improvement.

The original act has been greatly broadened, and under existing legislation there is no obstacle to the construction in the different states of the Union of those roads which serve the greatest economic needs. In the original act the cost of any mile of road built with federal funds was limited to $10,000 per mile, but the last congress increased this to $20,000, as it was found impossible to build certain types of road in certain places for $10,000 a mile.

Following this legislation the regulations governing the administration of the act and the standards for plans, specifications and estimates have been modified, and one of the most successful former state highway engineers in the country has been placed in immediate charge of the federal aid road act. He has at his disposal a considerable staff of local and district engineer aids, and this force works in cooperation with the various state highway departments. As a further federal contribution to the road program the war department has turned over 20,000 motor trucks, which will be distributed to the respective states for use on road construction.

If the proposed bond issue of $40,000,000 for California roads passes, as seems certain, when matched with similar appropriations from the federal government, we should be able to construct a splendid system of public highways linking up all sections of the state, and in the years to come the laterals can be constructed as additional funds become available.

It is almost impossible to predict the ultimate effect which a system of good roads will have upon the country districts. From what has already been done it seems likely that our present transportation system will be revolutionized, for the motor truck is rapidly coming into general use in transporting farm supplies long distances to market.

The motor truck is helping to solve the problem of the short haul. In the old days the producers of dairy products, truck gardeners and poultry raisers found it necessary to haul their products from the farm to the nearest railroad. After a short haul, but often a long wait, on the railroad, the goods reached the terminal yards of the city, and here again it was necessary to load these supplies on wagons or trucks to transport them to the city markets. The many handlings proved expensive and destructive, for often the perishable products were rapidly deteriorated or entirely lost by the frequent handling.

The modern dairy ranch or truck garden operating adjacent to the city loads the fresh supplies for market into trucks and without stop or additional handling they are quickly delivered to their destination. With good roads the truck is the most economical means of delivering supplies of this nature, and where a small producer has not sufficient tonnage to warrant the exclusive use of a truck, there are always plenty of neighbors who will join in providing a load, or commercial companies will handle the traffic on regular schedule and at fixed rates.

In hundreds of instances in all parts of the country there have been established regular motor truck routes, connecting the important cities with the rural districts within a radius of a hundred miles or so. These routes are laid out after a careful study of the region, the character and quantity of supplies to be handled and the traffic difficulties to be overcome. In Iowa, for instance, wherever good roads have been built in the country districts there have sprung up motor transportation companies which will haul anything from live hogs or sheep to pullet eggs. In Iowa during 1918 over a quarter of a million hogs were hauled to market in motor trucks, some of them traveling a hundred miles or so to find the best market.

Where a commercial motor truck route has been established for the handling of farm produce it is customary to construct small loading platforms at certain points along the route, and the farmers of the vicinity bring to these loading platforms the eggs or butter or fruit or vegetables they wish to send to market. The time of arrival of the trucks is posted so that the farm produce need not be unnecessarily exposed to the sun or rain while waiting for the truck.

From a careful survey made by experts of the department of agriculture, however, it has been definitely determined that motor trucks cannot be efficiently operated at a reasonable cost except on fairly good roads, so that the development of motor transportation is directly contingent upon the improvement of our highways.

In a rural district adjacent to Baltimore it has been demonstrated that a successful cooperative truck system can be maintained for the benefit of its members. This district, which was about 50 miles from the city, was largely used for dairy ranches and truck gardens, but as only one railroad was available it was necessary for many of the producers to haul their supplies long distances to ship them. The average time consumed in getting the supplies to the railroad was half a day and involved the use of a man and team. If the haul was made directly to Baltimore the round trip required two days.

Following the improvement of the public highways, a number of the leading growers of the community got together and organized a corporation to act as a cooperative hauling concern for the members. Each of the organizers took stock in the company and a board of directors was elected to govern the company. At first only two trucks were purchased, one of two tons and one of four tons capacity, but within a short time the demands for space were so heavy that additional trucks were added. As it was not intended to make any profit from the transportation company the rates for hauling were fixed at such a point as would cover the cost of operation and allow for the creation of a reasonable surplus fund to meet emergency demands. All commodities, from milk to cabbages, were carefully classified and rated, and when the members shipped apples or onions or melons, they paid the rate prescribed for that commodity. The trucks were operated on a rigid schedule, in charge of an operator and a man to do the loading. Each member brought his goods, properly marked and classified, to the loading station nearest his farm, where they were picked up by the truck and carried to Baltimore. In the city a central station had been established in the market district, and the goods were turned over to the consignees there. On the return journey the trucks carried manufactured and other goods ordered by the members for their own needs. By buying in community lots from wholesalers the members of the organization are able to save a considerable margin on the supplies they need. A central garage is maintained for the organization's trucks, in charge of expert repair men, and after each round trip the trucks are carefully gone over, minor repairs made and the equipment kept in the best possible condition. The success of this Maryland community in marketing their products by motor truck has been so great that many other communities are copying the scheme and cooperative truck companies are being organized at a number of points.

Good roads will enable the farmer not only to market his small produce, his eggs, and butter and milk, by motor truck, but they will also enable him in many cases to handle his basic crops in the same way. In California it is now a common sight in our country districts, especially at harvest time, to see a long string of from four to eight heavily loaded wagons or trailers, carrying rice or wheat or barley to market, pulled by a chugging tractor. With the handy trailer the average load of a motor truck can be almost doubled where the grades are not too steep to prevent this maximum haul.

Substituting Gasoline for Hay

By James De Camp

NOT so many years ago country life was a favorite target for the clumsy shafts of the professional punster and the "city fellers" were inclined to hand the royal pooh-pooh to their rural cousins.

Today almost the reverse is true in a number of instances. The progressive agriculturist of 1919 is making use of the most improved methods and devices. He has substituted the throttle for the whip, the fuel tank for the nosebag and gasoline for hay. His goods go to market drawn by a steed that is shod with rubber instead of iron—that has no reins but is guided by a steering wheel.

Although motor trucks were firmly established in the agricultural field a number of years ago conditions arising from the war made their use imperative in a number of localities. Those who had refused to believe that the most expeditious and inexpensive means of reaching market was furnished via the gas and rubber route were forced by circumstances to prove this fact for their own conviction.

Incidentally a number of the "show me's" discovered that, apart from connection with the market, there is scarcely anything more handy to have about the farm or ranch than a sturdy, dependable motor truck.

In the selection of a truck for the farm this dual object of transportation and routine work should be kept in view. There is a truck for every task—a number of tasks for every truck. On a large place many hours may be saved by using the truck to transport workers, implements and supplies from field to field. In harvest season a good machine may be loaded directly from the scene of cutting or picking as easily as a horse drawn vehicle, this practice being followed extensively with the large producers of sugar beets.

Discretion and forethought are necessary in choosing from the wide variety of types on the market the particular equipment best adapted to the demands of the user. In addition to type there is the problem of capacity.

With regard to these matters common sense is the most reliable dictator and not the conclusions of some person interested in the sale of a particular make of vehicle. The proprietor of a poultry ranch or truck gardening business would not display good judgment in purchasing a unit of the heavy construction necessary to

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

To the casual observer the scene on the cover of this week's issue is simply one of California's views worthy of perhaps passing interest, but to the person who a dozen years ago rode over the section where this picture was taken, when it was known only as the Colorado Desert where venturesome people occasionally went and unfortunately occasionally died for want of water—to that one this view is truly remarkable. The Imperial Valley has given opportunity to many an American to make a home with luxuriant surroundings and on lands which are wonderfully productive. The American farmer has risen to the occasion, and today several trainloads of cantaloupes will leave this rich valley and bring back great sums of money to Imperial producers. Other trainloads tomorrow, and so on through the season with live stock, grain, hay and other products. These wonder crops call for wonder roads, and considering the recent development of this valley the roads are more extensive and better than usual in a new country. In addition, July 1 will be the date of an election for another $1,500,000 of bonds, beside, we doubt not, a rousing majority for the state road bonds, election for which will be held the same day.

DAYLIGHT SAVING

Congress is all mussed up over the daylight saving law. Almost to a man Eastern farmers are working for a repeal, but organized baseball, golf and city gardeners and many others who want an extra hour after their regular day's work is done, are fighting for retaining the daylight saving.

California looks on with more or less indifference, though dairymen and many others are heartily in favor of the change to sun time.

MAKE IT A MILLION

The 33 Northern and Western states have set a goal for a million members in farm bureaus. They are starting with less than half that, in fact, 409,841, but this is an increase of about 30 per cent since December, 1918. According to the 1910 census these states made a showing of 3,262,955 farms, and it is hoped to have at least one-third of the farmers represented in the farm bureau work.

STAYING IN AMERICA

A few years ago American farmers seemed to be joining in one great trek to the rich wheat lands of Western Canada. It is reported today that these cheap lands are not showing the pulling power they formerly did and that there are no more farmers going to Canada from the United States than come to the United States from the Dominion. America offers all kinds of opportunities for her best farmers.

MORE LABOR

Many a fruit grower is finding difficulty in providing for the coming harvest. It is sometimes claimed that the cities are full of idlers, but the harvest fields with a year of big crops and big prices may be in sore need unless organized effort is made to correct the situation. The Women's Land Army has been disbanded and many of the returned soldiers have not yet dropped into their regular niches. Some sections are organizing to meet the need.

"KAN THE SASS"

With prices prevailing this year for fresh fruit every home kitchen should provide itself with every possible can of fruits and vegetables which may be put up. Foods which in past years have been waste will this year be saved in this way.

The boys and girls' clubs of Kansas have adopted a slogan suggested by the name of their state; "Kan the Sass". In 1918 there were nearly 4500 members of these boys and girls' clubs and they saved a half million quarts of canned fruits besides over 30,000 quarts of jelly, totaling in value considerably above a quarter million dollars.

DIE-BACK

Walnut growers have suffered greatly because of die-back, which has affected their orchards in nearly all sections. One Hemet grower, Mr. B. Steinberg, has an orchard of which it is said: "A year ago Mr. Steinberg's orchard was very badly affected with die-back. Today it is one of the best orchards in the whole section."

Under the auspices of the Riverside County Farm Bureau, a meeting of walnut growers from all the southern counties has been called for two o'clock on the afternoon of June 17, in the orchard of Mr. Steinberg, one mile south of Hemet. Professor Batchelor, walnut expert from the Citrus Experiment Station; Mr. Carlyle Thorpe, manager of the Walnut Growers' Exchange, and other noted experts on walnut culture will be present to explain how to prevent die-back, and how to bring back trees already badly attacked with this trouble.

COMMON SENSE

In addressing the nurserymen's convention State Horticultural Commissioner Hecke referred to the successful enforcement of horticultural and, in fact, all other laws, as depending largely upon cooperation and common sense. These three or four words contain a remarkable amount of common sense, and we are glad to note that these recent conventions have resulted in a great increase in cooperative support and in greater use of common sense than has been the case in some law enforcement proceedings.

WATCH THE WIRES

Reports are occasionally noted in Eastern farm papers of accidental deaths caused in the moving of derricks, hay stackers or other tall appliances where proper attention has not been given to high voltage wires. About the last thing on earth that a human has occasion to argue with is a high voltage current, and metal parts on these tall implements sometimes carry swift death. When occasion arises for moving tall structures in the neighborhood of electric wires, experts from the electric company should be notified to be on hand to aid.

BREAK THE MATCH

A Middle West paper, in calling attention to the danger of disastrous fires from a carelessly thrown match, suggests to smokers and others who are inclined to be careless in dropping these firebrands, that before the match is thrown away it should be broken in two pieces. Half a match still lighted could without question start as disastrous a fire as a whole one, but if the habit is formed of breaking it in two it is reasonably sure that the habit of putting the match out will be so firmly established that a few additional millions may be added to the farmers' output.

RECORD SALES

During the past month there has been held a series of the most sensational live stock sales ever recorded in American history. Values, that a few years ago would have been considered impossible, have been established and have touched the major breeds of both beef and dairy cattle. Within the month a Shorthorn sale made an average of $2960; a Hereford bull sold for $35,000; 120 Hereford bulls and females were cashed for an average of $3635; 47 Aberdeen-Augus females averaged $2583; 83 Guernsey bulls and females averaged $2172; a Holstein bull changed ownership at $125,000; a cow for $40,000—at this writing the general average of that memorable sale is not at hand. Because of the rapidity with which new records have been made and broken, one hesitates to specuate on the future. The question in the minds of all: "When will the limit be reached?" cannot be answered.

Whether prices being paid are too high will depend solely on the ability of the individual buyer. It is certain that many of the buyers will have disastrous experiences; it is equally certain that some buyers will find that they have made excellent investments.

To the rank and file of live stock breeders the extremely high prices need not be disturbing—as a whole the live stock industry is on a solid basis.

BUILD MORE

Two weeks from next Tuesday is election day. Shall the taxpayers of California bond themselves for $40,000,000 for roads? We believe the voters will give a unanimous yes to that question. If there is opposition, it is so quiet that it is not noticeable, but farmers, the fruit growers especially, have need of greater economy in delivery of their products to the market. They have need of delivery of a better grade of product, and to deliver a high grade product calls for improved roads.

The publisher of the Cultivator recently attended in Chicago a meeting of publishers of farm papers, and he made a showing through a series of charts or maps of the magnitude of California's productive industries. These maps even located in the different counties our various farm products, and at the same time another map was shown with bright red lines indicating over 3000 miles of paved highways and over 5000 miles of graded hard surfaced roads. This map attracted more attention than any other because, being farm paper publishers, those viewing it knew the great value such a road system must have for crop producers of the state.

Besides various county appropriations and bond issues this road system has caused the state to bond itself to the extent of $33,000,000. It is now proposed that an additional $40,000,000 will carry these roads into many another producing section.

Note the date, July 1—$40,000,000 for prosperity.

THIRTY-SIX CENTS

An article which is apparently "inspired" in a daily paper of one of the larger cities of the state calls attention to a "spread' or an imitation butter and suggests to the housewife the wisdom of saving 36 cents per pound on her butter bill. In order to make the 36 cents it is necessary to set a price on butter of about 75 cents per pound, which, even at the present high prices, is going some, or was at the particular date in question, June 2. It was stated that this particular article "cannot be detected from butter when properly colored and is much cheaper than the cow's product." The writer also suggests that people do not eat butter because of its food value so much as to get an "appetizing spread".

Dairymen, however, still count on the statements made by dietitians that butter and other dairy products are essentials in the diet of a people who would be healthy and efficient. Nut butter, margarin, hog butter, or whatever it may be called, is no substitute. It may be healthful enough and may fill a certain need, but it should in no sense be regarded as a butter substitute. But the dairyman must awake to the danger in the margarin situation. Where a few years ago there was a quarter of a million pounds of imitation butter sold, it is reported that today it aggregates about 18,000,000 pounds. This has been accomplished by a thoroughgoing advertising campaign.

A hint to the wise dairyman is sufficient.

The Aftermath of the Conventions

THE delegates to the recent convention at Riverside are still on their way home. Several from other states have expressed themselves as having great enjoyment and greater profit in this great gathering of representative Westerners . As one has expressed it, agricultural and horticultural interests have received an uplift as in no preceding convention. Chas. A. Park, the Oregon quarantine official, feels that the better understanding between quarantine officials of the various states amply justifies these great gatherings.

The convention closed with trips to Yucaipa Valley, citrus experiment station, March Field, Corona, Pomona, Ontario and other nearby sections.

From the Ladies Auxiliary

From left to right: Mrs. J. W. Brace, Mrs. Fred Howard, Mrs. J. S. Armstrong, Mrs. R. M. Teague, Mrs. J. D. Merriwether, Mrs. Max J. Crow, Mrs. John Valance, Mrs. C. B. Messenger, Mrs. E. A. Shinn, Mrs. Henry Kruckeberg, Mrs. H. Plath, Mrs. J. R. Slade.

CONVENTION SAYINGS

D. B. Mackie: Even in enforcing these regulations effective service may be rendered and still, if done in the right spirit, the good-will of the parties against whom the quarantine is enforced be retained. If we are reasonable and show necessity for the action we will be met by reasonableness.

C. A. Park: Oregon produces in some years $15,000,000 worth of potatoes. You may see there is some reason in our being most rigid in our quarantine and demanding only absolutely clean seed. We insist that our own producers be equally as careful in shipping out.

Hilda B. Nielsen: Conditions are such today in the growing of potatoes that our methods of raising them must be better or we potato growers will have to find other means of livelihood.

E. Pellegrin, Representative of Governor Cantu: You can count on the hearty cooperation of Governor Cantu in any movement looking toward the protection of agriculture. The governor is now organizing a chamber of agriculture.

Geo. P. Weldon: Yes, I am going to retire from the work of the state horticultural commission and take up work along educational lines in connection with the Chaffee Agricultural School at Ontario, San Bernardino County. I believe the opportunity in connection with this school for me to aid in advancing California's agricultural interests will be fully as great as with the state horticultural commission.

V. V. Leroy: The farmer's club has possibilities as great as any organization in California for the advancement of the larger agricultural interests. The Claremont Pomological Club has been in existence 22 years and is responsible for some of California's best agricultural legislation.

Carlyle Thorpe: There are two equally important factors in any horticultural enterprise — producing and marketing. The average horticulturist devotes over 98 per cent of his time to producing and two per cent to marketing, yet the selling end is as important as the producing.

E. M. Ehrhorn: In the matter of quarantine we must destroy every plant or bit of soil which comes from infested territory. The quarantine officer must, however, use common horse sense and tact. We allow no potted plants to enter the territory as soil is reasonably sure to carry the infection.

A. D. Shamel, speaking to nurserymen: Your catalogs are confusing in that every tree, good, bad or indifferent, is made to stand out as especially desirable by all the superlatives which can be used.

E. A. Chase, Riverside: I began in the nursery business in 1856. I have observed thousands of plantings and am sorry to say that not fifty per

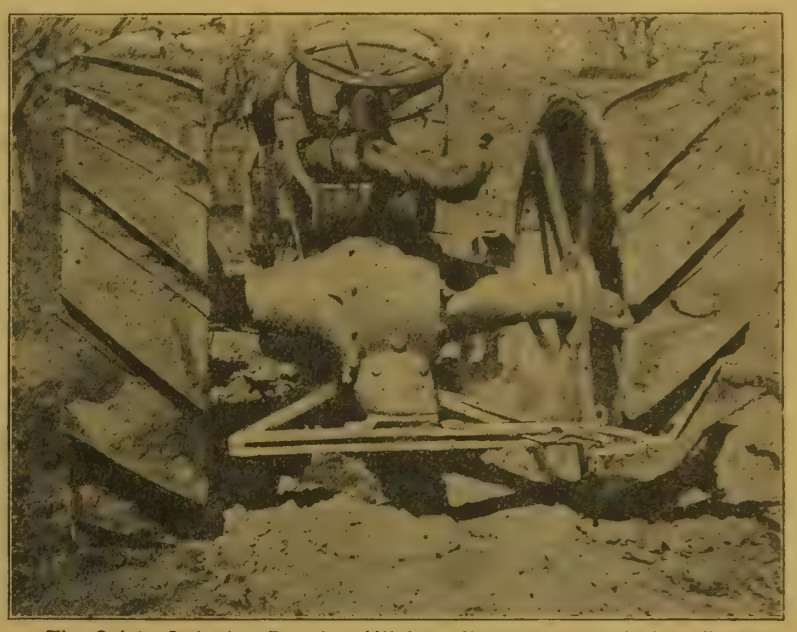
The Goleta Swinging Drawbar Hitch
Adds Great Value and Utility to Your Fordson



Disking, Harrowing and other field and orchard work is simplified and finished more quickly and economically when done by a Fordson Tractor equipped with

The Goleta Swinging Drawbar Hitch

It can be designed for any Wheel type Tractor.

Instead of the usual turn, this extension and self adjustable hitch permits the tractor and implement to make quick short turns. You can go up one side of a row of trees, turn right around and down the other side.

You can turn around with a 15 foot harrow so short that no ground is left unharrowed. This saves a great deal of time because you do not have to reharrow and redisk the turnouts or ends to cover places previously missed. **This enables the operator to do better work in shorter time and with less fuel.** It prevents the extra strain thrown on the engine in turning short and also prevents the engine "digging in" as a cramp turn will force it.

The Goleta Swinging Drawbar Hitch as it appears attached to Fordson Tractor, permitting short turns with any implement.

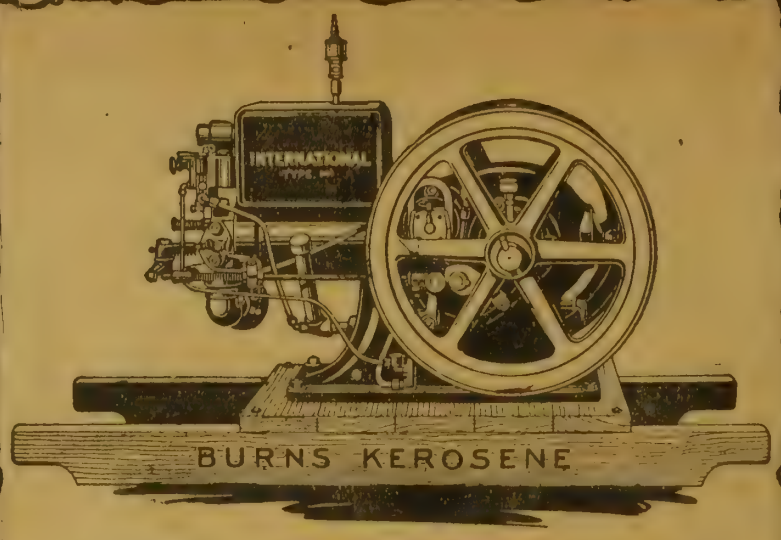
Put a Swinging Drawbar Hitch on Your Tractor

This hitch is made in the shape of a triangle but the strain of the load comes at the center of the rear axle (drawbar head) just as the Factory designed it. But by attaching the swinging connecting bar to the point of the triangle under the center of the tractor and permitting it to work through a double steel bar, slotted clear across the rear of the tractor, and attached to the implement 14 inches farther back, a wide turning radius is provided. It makes the difference of turning around in a short radius and a wide radius.

Get One---Put It on Your Fordson
It Will Quickly Pay for Itself

I am a farmer and have operated my Fordson successfully without incident and it does good work. All the Fordson dealers are my friends because I have a simple, economical attachment that helps them sell more tractors and give still better service where attached to those already sold. You won't have to go into the adjoining field to turn around with any tractor to which this drawbar is attached.

Agents Wanted Everywhere



These attachments can be designed for any size wheel type tractor. If you are dealing in tractors or supplies to Farmers write for the agency. If you own a tractor write stating what kind giving name and address and name of nearest Ford or Fordson dealer or other tractor dealer.

Address all inquiries to

Ernest Sexton, Goleta, California

or write or call on any of the following agents who sell and recommend the Goleta Swinging Drawbar Hitch and to whom orders may be sent in their respective territories.

E. W. Alexander, Ford Agent, Santa Barbara, Calif., Ventura, Calif.
Ford Garage, Ford Agent, Bakersfield, Calif.
E. C. Hotchkiss, Ford Agent, Covina, Calif.
Geo. Mitchell, Ford Agent, Whittier, Calif.
Corpe Bros., Ford Agent, El Monte, Calif.
J. A. Nadeau, Ford Agent, Nadeau Avenue, Los Angeles, Calif.

Let It Carry Your Load

IN the olden days folks put the world on the back of a fabled giant called "Atlas." Today progressive farmers put a world of work on the shoulders of an

International Kerosene Engine

This sturdy, reliable, willing, inexpensive servant is doing more today to take drudgery out of farming than any other one factor. It tackles scores of jobs about the farm — such as sawing wood, pumping water, cutting feed, running the fanning mill, etc., and disposes of them swiftly and satisfactorily.

Rations for the smallest size cost less than 3c per hour—pretty cheap board for a "jack-of-all-trades" that does the work of a dozen men. Stop working so hard. Slip all the pesky little jobs to an International. It conserves your time and labor and fattens your purse. There are three sizes, 1½, 3 and 6-H. P., all operating on kerosene or gasoline.

An International dealer nearby will go over this work wizard, point by point, and explain why its "credentials" are gilt edge. Or write the address below and full information will be supplied.

Hemet Valley Getting Ready for Big Fruit Crop

A Cultivator representative visiting Hemet Valley reports that it is ready for its greatest "cot" season. By June 15 the apricots will be turning rapidly to the rich yellow shade for which they are noted, and the picking, drying and canning season will be on with a rush.

This season it is conservatively estimated that they will raise around Hemet and San Jacinto 150,000 tons of apricots, and the price of $52.50 for dried apricots means that if all this 150,000 tons is dried—which of course it will not be as the canneries will handle two-thirds or more of the crop—the receipts to the ranchers of Hemet Valley would run to the enormous total of $7,875,000. This figure will give some idea of the hugeness of Hemet's apricot crop as the canned apricots will themselves require labor and material, all of which will be handled at Hemet and which will increase the values in that way as much as the value of the dried product increases through that process. The crop last year ran slightly over 100,000 tons at about $15 per ton lower than the present market.

Added to the apricots it must also be remembered that peaches are grown in great quantities in Hemet Valley and they will add much more than a million dollars to the valley's resources. The citrus belt just east and south of Hemet is also a big money maker and the Valencias are now going to market in carloads.

Taking Hemet's three leading fruit crops, to say nothing of the walnut orchards and hay production, more than $10,000,000 may be accounted for during the year. The two banks at Hemet and the one at San Jacinto show continuous growth in deposits. The "Associated" cannery is working overtime to double its capacity. Last year the independent cannery handled more apricots than the association people did, and the association is making an effort to retrieve the honor, and their excellent returns last year are aiding through the addition of new members. Large forces of carpenters and other workers are constantly at work on the additions, and the machinery will be ready when the season starts.

The labor problem is as vexing as ever this year and the ranchers can hardly understand why they cannot get help when they pay forty cents an hour for ordinary help and pay a scale that will enable experts to earn more than $6.00 per day. They are writing and wiring Los Angeles, and some of them are trying to get help from Imperial Valley. The labor shortage may possibly result in decreased volume of the fruit by reason of inability to pick at the proper time. Some ranchers are holding back the sale of their crops thinking this will have a tendency to further stiffen the rising market.

Save Crops by Chemical Means

To save crops on hundreds of acres of land in California on which cultivation has been stopped because of weeds, George P. Gray, assistant professor of entomology at the University of California, has issued a preliminary report on his extensive investigation.

"The cultivation of crops has been actually abandoned on hundreds of acres of some of the most fertile land in the state," Professor Gray states, "and the production of thousands of acres more is rapidly decreasing through the increase and spread of Johnson grass and wild morning glory.

"None of the root absorption experiments seemed to point the way for control of wild morning glory on agricultural land at a reasonable expense and without serious injury to the soil. Incidental to the main object of the experiments, the control of the wild morning glory on agricultural land, data have been obtained which show the superiority of arsenic as a soil sterilizer. All of the Centerville plots to which an ounce or more of arsenic trioxide had been applied per square yard were barren of all vegetation, except wild morning glory, for 14 months, notwithstanding the leaching by the rains of two winters.

"The leaf absorption experiments have definitely established one fact of importance from a scientific as well as from a practical standpoint, namely, that a dilute solution of sodium arsenite applied only to the aerial parts of the wild morning glory under certain conditions will destroy both the aerial parts of the plant and the underground parts to a depth of several feet."

California Crop Distribution and Estimates

The state horticultural commission has given us a fund of valuable information in the April number of the monthly bulletin. The state has long needed a dependable report of its agricultural and other performances. This report touches upon fruit and other miscellaneous crop statistics. Of course, the live stock industry is not considered. The state board of agriculture has issued reports in which crops and live stock both are given attention, but the agricultural board has never had funds sufficient to make the report as effective as it should be. The report of the horticultural board is made up of statistics which it has secured through its own officials, county horticultural commissioners, and officials of the bureau of crop estimates of the United States department of agriculture.

The statistical material is preceded by a number of articles such as "The True Value of Horticultural Statistics," by Commissioner Hecke; "Specializing in Fruit Growing," by Deputy Weldon; "California Crop Production by Counties," by E. E. Kauffman of the department. One especially valuable feature is the liberal use of the map of California with indication around each county in which a particular crop is raised.

OREGON AND WASHINGTON PRUNE GROWERS GET TOGETHER

Prune growers of Oregon and of Clarke County, Washington, are considering the formation of a cooperative marketing organization along the lines of the fruit growers associations of this state.

BIG PEACH CROP

Manager Niswander of the California Peach Growers, Incorporated, estimates the coming peach crop of the state as a record breaker. The biggest output of any year was in 1917 and this, Mr. Niswander thinks will be exceeded in 1919, with prices unusually high.

CALIFORNIA STRAWBERRY OUTPUT

According to figures of the United States crop bureau California's strawberry crop in 1918 was 12,656,600 quarts. 54 per cent of this is consumed locally, 31 per cent processed and 15 per cent shipped outside the state.

No Belts—No Suspenders

LEE UNION-ALLS are all in one piece—so easy and comfortable you'll be glad you own a suit every time you put it on. Remember, too, that LEE UNION-ALLS cover your body from head to foot, protecting your skin from dirt, grime and chaff.

Superior quality features make LEE UNION-ALLS the most economical work garments manufactured. All seams are triple-stitched, all strain points are reinforced; buttons are rivited to the cloth; button holes are rip and ravel proof. Many other features insuring long, satisfactory wear. If your dealer does not handle LEE UNION-ALLS, write for further information and tell us his name.

A Farm Becomes a Home When Drudgery Leaves

A farm becomes the ideal home when back-breaking tasks are eliminated. And tasks of this kind can be eliminated. Such chores as milking, churning, wood sawing, water pumping and feed cutting may be handled with little manual labor and in quicker time if they are done electrically.

G-E Farm Motors

are giving this kind of service economically and satisfactorily. You will find that the nearest Central Station or G-E Motor Agency has complete information on motor costs, sizes required and operating charges. You will find experienced men ready and willing to offer suggestions on the best motor installation for your own particular needs. This service is freely given.

SUBSTITUTING GASOLINE FOR HAY

(Continued from Page 803.)

acommodate two and a half or three tons while, vice versa, the man who must transport sugar beets or baled hay should not select a light delivery model of small capacity. The self evident truth that speed decreases as capacity increases should be borne in mind continually.

For the small place the haulage problem may often be solved at slight expense by replacing the tonneau of an old touring car with a delivery box or hitching a trailer to the stern of the family car. The next step takes us to the light delivery wagon, usually with a capacity of from 1000 to 1500 pounds and equipped with pneumatic tires in most instances. Pneumatic tires are a necessity when breakable goods, such as eggs, are to be hauled frequently and absorb a large percentage of the road shocks transmitted to the mechanism by solid tires.

Larger trucks built for any capacity desired are almost invariably equipped with the solid tire although mammoth pneumatic tires are gaining steadily on the market. The solid tire requires a minimum amount of care and is very successful on our California good roads, but the operator should be cautioned against driving too speedily upon rough stretches with this equipment or depreciation will be hastened.

Similar to the tractor the truck requires a decent amount of care and proper lubrication. There is probably no article manufactured which is called upon to stand more hard knocks, twistings and jolts than the motor truck. Usually the owner is very considerate of his property when driving, but the employed operator seems to take a devil-may-care attitude toward his work. With average use the truck should be gone over at least once each week with special attention to the grease cups and tightening up of loose bolts and adjustments. Men who willingly devoted several hours a day to caring for their teams seem to begrudge their truck even a few minutes of cursory inspection and take the attitude that the tractor should keep itself in trim with an occasional swig of gas and oil.

The new truck owner who has been used to handling a pleasure car invariably makes the mistake of demanding too much speed of the truck motor. While the light delivery types are quite flexible in this respect most of the heavier units reach their maximum efficiency at a speed of from 15 to 20 miles per hour, some being provided with governors to prevent the operator from driving faster than a certain fixed rate.

Another pitfall that many inexperienced owners are prone to tumble into is the substitution of inferior fuel for gasoline. When the truck is designed to burn distillate or has been provided with a special carburetor for this purpose there is no harm done by using the inferior liquid, but otherwise the slight economy effected is dearly paid for in damage to the internal mechanism, and time lost in starting.

Most trucks are built with a margin of sturdiness sufficient to bear up under more than the specified capacity; but if an overload must be taken care of frequently it is wiser to make use of a trailer, thereby distributing the weight over a larger area.

Trailer construction is fast becoming a recognized industry, engaging the constructive ingenuity of men well versed in automobile designing. The slipshod makeshift trailer which whips from side to side on the road to the great danger of other traffic will soon be prohibited by law.

A scientifically balanced trailer provided with proper bearings, tires and side palings will call for a larger initial outlay but the reduction of resistance and side strain will soon make up the difference by lessening depreciation and fuel consumption. Proper connection with the truck is a matter of importance and should be so contrived as to provide an adequate turning sector for the tongue when rounding corners.

Attention is called to the California vehicle act which requires that trailers be registered with the state motor vehicle department and display license plates issued by the state. The law also states that no vehicle shall be permitted to draw more than two trailers.

When stock must be transported frequently and the body of the farm truck is not suitable for that purpose it has been found convenient to keep on hand a trailer with platform suspended lower than usual and having high sides, removable to facilitate cleaning. In this kind of work it is especially advisable to look well to the fastenings so that one will not duplicate the recent experience of a Southern California rancher who loaded a valuable heifer on a trailer behind the family flivver and drove several hours before finding that the coupling had come loose and left the animal stranded in mid-road.

The wide-awake farmer can frequently more than pay the expenses of a trip to the county seat or neighboring cities by arranging to bring back a return load for one of the local merchants or a neighbor. In some places bureaus have been established for this purpose and none of the trucks in the district are alowed to indulge in "slacker miles." When one is the only truck owner in the neighborhood satisfactory arrangements may be made to do buying for the neighbors as well as attending to one's own business when in town.

So popular has truck transportation become that but a very small percentage of California's agricultural "freight" is now handled by the railways. Some claim that 92 per cent of all hauling in the state is now accomplished by truck while others mention the more conservative figure of 75 per cent.

One of the fads that is getting much publicity in connection with the growth of trucking is that of figuring what is called the "ton mile." This pastime should be set aside for the horn-rimmed efficiency expert with nothing to do but whittle pencils and dabble with reams of figures. The correct determination of the ton-mile necessitates keeping a rather complicated record of the truck's mileage, fuel consumption and the weight of each load hauled. The process involved is tedious and the results of little definite value to the agriculturist who uses his truck for general utility purposes.

A simple record of gas, oil, tire and repair bills and a fair allowance for depreciation will provide the necessary data to show the practical man whether he is keeping ahead of the game or not. If your truck does not do more work for the same or less expense than a team and shorten your driving time from 60 per cent to 75 per cent, sell it!

AFTERMATH OF THE CONVENTIONS

(Continued from Page 805.)

cent of trees which are planted in orchards pay land rent.

Leonard Coates: There are "improved" Fench prunes. There are trees which bear regularly and every year of the small French prune. There are others which bear as consistently, and even larger crops, of a much larger, higher quality of prune.

Wm. T. Kirkman, Fresno: We must standardize nursery trees, and this standardization should not consist in their ability to grow three, four or six feet slender whips, as they will do when planted closely together, but the biggest factor in standardization should be the caliper.

Dean Thomas F. Hunt: Fruit, you know, is only glorified sugar.

They say: Secretary Avery Hoyt was pretty nearly everywhere and has a most pleasing and effective way of being helpful. Messrs. Sharp and Hammond, the one with a voice like Frank Wiggins, of the local committee, did everything to help everybody every moment.

C. C. Teague: The disposal of the Lima bean crop is one of the best examples of cooperative marketing. More than 4,000 sacks were thrown into the pool; prices were advanced from six to eight cents in two months and 558 cars sold, and the market is today stronger than at any period since harvest. Only through cooperation can farm products be successfully marketed.

President Blaisdell of Pomona College: Overproduction of non-producers is one cause of economic troubles. There is only one common denominator, and that is work.

President Evans of Occidental College: The key word of the future is cooperation. Let us beat our tanks into tractors.

Geo. H. Hecke: This is California Fruit Growers greatest convention. Riverside has gone the limit in hospitality.

Frank Miller: When Theodore Roosevelt visited this hotel he admired the beauty of this mission style of agriculture and said. "It's the strong and simple things which are beautiful." I think we should all surround ourselves with the beautiful so far as possible. Sentiment pays.

WESTERN PLANT QUARANTINE BOARD

More than a year ago plans began to be made, looking toward coordinating the various quarantine activities, and an effort was made to perfect this organization last fall, but owing to the postponement made necessary of the Fruit Growers Convention, this effort was called off. It is very probable, however, that this has resulted in a much stronger organization being formed last week.

The one greatest accomplishment was the securing of unity of action and greasing the ways for more effective regulations in every state. Heretofore there has been some little friction and at times even open conflict in the matter of commerce in nursery and agricultural products between the various states. No one of these states but has suffered greatly by the depradations of introduced pests, and during recent years strongest efforts have been maintained by quarantine officials to prevent introduction of still more pests. This has led at times to discrimination which producers of other states have resented. This conference has resulted in bringing together men from these various states to the end that more harmonious action may be taken and there will be less loss to producers.

The officers elected are: Geo. H. Hecke, chairman; Chas. A. Park, Oregon, vice-chairman; Harold R. Hagan, secretary-treasurer.

Preamble

We, the plant quarantine officials of the Western States of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming and the Territory of Hawaii, District of Lower California and the Province of British Columbia,—here assembled in the first Western Plant Quarantine Conference at Riverside, California, May 26 to 31, 1919,—for the purpose of discussing quarantine questions, pertaining to promulgating and enforcing our various regulations—believing that uniformity of action is conducive to better results in our work, deem it advisable to form an organization for our mutual cooperation and understanding. For this purpose, we hereby adopt the following Constitution and By-Laws:

Constitution

Article 1, Section 1. This organization shall be known as the Western Plant Quarantine Board.

Section 2. Members. This board shall be composed of the plant quarantine officer, from each of the following states, territories, provinces and districts: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Territory of Hawaii, District of Lower California, Province of British Columbia.

Article 2, Section 1. Purpose. It shall be the purpose of this organization to secure a greater mutual understanding, closer cooperation and uniformity of actions for the efficient protection of our plant industries against plant diseases and insect pests.

Another article provides for election of officers, and the by-laws provide for regular meetings and routine work of the officials.

The constitution and by-laws were approved and signed as members by Arizona, Andrew Kimball; California, Geo. Hecke, by Frederick Maskew; Colorado, Geo. M. List; Idaho, W. H. Wicks; Montana, A. L. Strausz; Oregon, Chas. A. Park; Utah, Harold R. Hagan; Washington, M. L. Dean; Territory of Hawaii, Edw. M. Ehrhorn; Province of British Columbia, W. H. Lyne.

The three states, Nevada, New Mexico, Wyoming, were not represented, but it is anticipated they will become members later.

WESTERN PLANT PROTECTIVE ASSOCIATION

There were so many associations and branches of associations holding meetings in Riverside during convention week that it is hard to keep entirely straight as to correct names of each. One, which has been confused with the Western Plant Quarantine Board, but still an entirely separate organization, is the Western Plant Protective Association. This association is really the outgrowth of a meeting held April 14 at Portland, Oregon. It was called by H. P. Barss, largely in the interest of using quarantine or other protective measures to prevent the entrance of the white pine blister rust which is causing such havoc amongst the pines of Eastern states. The suggestion was first made that an organization be formed at the time of the Portland meeting, but in view of the probability of securing enlarged membership from among the plant lovers and quarantine officials who would attend the Riverside meetings, definite organization was postponed. The organization was effected at Riverside with the following officers: President, H. P. Barss, Corvallis, Oregon; first vice-president, Dr. E. P. Meinecke, San Francisco; second vice-president, E. M. Ehrhorn, Honolulu; secretary, Dr. G. R. Hill, Logan, Utah; treasurer, A. L. Strausze, Missoula, Montana.

While this organization has within its membership many of the quarantine officials of the Western states it will not have any direct police powers as has the Western Plant Quarantine Board.

PACIFIC COAST BRANCH

The Pacific Coast Branch of the American Association of Economic Entomologists met in regular annual session at Riverside last week. The most interesting feature of the meeting was the addresses and discussions on the method of fumigation with liquid hydrocyanic acid gas. Prof. R. S. Woglum of the United States department of agriculture gave a talk on the new fumigation chart. Other talks on liquid cyanide were made by Prof. Geo. Gray of the state university and Mr. Campbell of the San Gabriel station of the bureau of entomology.

Prof. H. J. Quayle of the University of California was the retiring president and the newly elected president is E. M. Ehrhorn of Honolulu. The other officers elected are R. W. Doane of Stanford, vice-president, and E. O. Essig, Ventura, secretary.

Acreage planted to tomatoes this year is 23 per cent less than a year ago. Pricers offered by canners are also less.

AVOCADO GROWERS' OFFICERS

The board of directors of the California Avocado Association has elected officers for the coming year as follows: President, Wm. H. Sallmon, San Diego; vice-president, J. M. Elliott, Los Angeles; secretary-treasurer, W. L. Hardin, 623 South San Pedro St., Los Angeles. The directors have decided to hold the next meeting at Santa Barbara, October 24-25. The association is now issuing its annual report containing much of the information gathered at the recent Pasadena convention.

CANNERS ADVANCE PRICES ON PEACH CONTRACTS

The canneries have again granted an advance of $10 on cling peach contracts. The new basis is $45 per ton for Tuscans and Phillips and $42.50 for Midsummer, Levy and other varieties.

APRICOTS AVIATING

Several apricot growers of Cupertino, Santa Clara County, are reported to have held out for a higher price than $100 per ton, at which figure the bulk of the apricots in the valley were contracted, and to have secured $110.

Seventy-five boys and girls of Maricopa County, Arizona, have joined the Boys and Girls Pig Clubs.

A Comparison of Costs

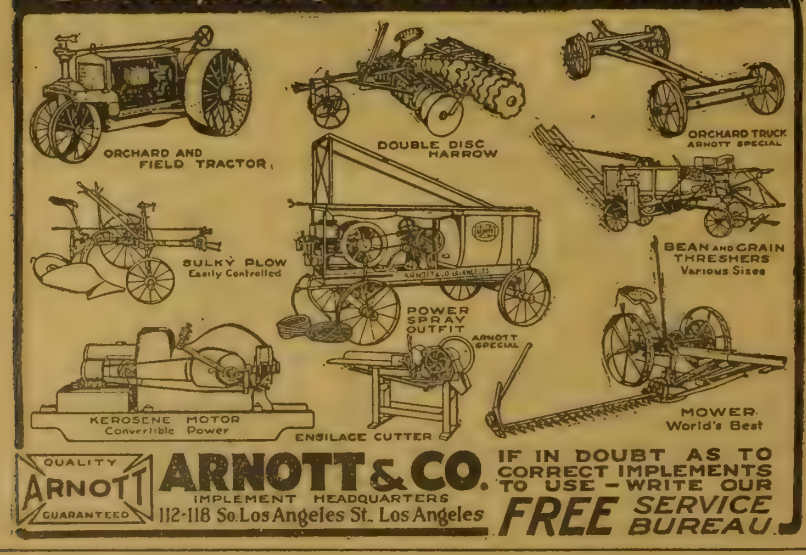
A graphic picture of the high cost of doing business is shown by the rise in a long list of commodity prices during the past five strenuous years.

By the exercise of unparalleled economies, telephone rates have been kept almost unchanged.

The fact is, the increase in the cost of commodities has resulted in what is equal to a decrease in telephone rates. In other words: The dollar which was spent for the telephone has bought more than twice as much as the dollar spent for the commodity.

The activities of reconstruction which are now upon the nation have put a great burden upon the telephone. This condition has made necessary an advance in telephone rates.

This advance does not exceed an average of eight per cent; almost negligible as compared with the advances in other lines of industry, yet enough to cover the increase in the cost of operation.



Only through adequate revenue can there be assured the maintenance of a high standard of telephone service.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Caponizing

Do you know whether it really pays to caponize White Leghorn cockerels, with the high price of feed in Southern California? Also have R. I. Reds. What is your opinion about caponizing them? Will probably have 300 or 400 cockerels this year. What would be the average cost per capon for feed?—Subscriber, Ventura County.

It might be worth while to caponize the R. I. Red cockerels if you wish to keep them till next February, but the Leghorns should be marketed as soon as they reach broiler size. From all I can learn it costs about the same to feed a capon as a laying hen, which, at present prices, is from $3 to $4 a year, depending, of course, on the feeder and on whether the feed is bought at wholesale or retail.—J. A. K.

Preventive Dosing

I have heard of Soda-Nuxine being very good to give to chickens in their drinking water at regular intervals. Users of it claim it is a preventive and cure for any chicken diseases where there is a secretion of pus, such as roup, chickenpox, sore heads, diarrhea, etc. I should like to have the directions for making it, also how often and how much to give. I have been putting potassium permangate in their drinking water once a week, but it colors the water and the chickens do not seem to like it. Would Soda-Nuxine be good to give to turkeys, old and young, to keep them in good shape?

Why anyone should wish to dose chickens that are not sick is beyond me. I have never heard of Soda-Nuxine. Probably it is no better than an occasional dose of Epsom salts, which many poultrymen use, especially in the spring, to keep the system from becoming clogged, but the salts are better given in a moist mash, half a teaspoon to each adult bird, than in water. I doubt if any medicine is efficacious when given in the drinking water. You never know how much your birds get or whether they get any. Potassium permanganate, colloquially known as "pink tea," is of no use at all in the drinking water. If your chickens have actually developed roup or swellhead, dipping their heads in a solution just colored pink with the permanganate cleanses the nasal passages and often gives relief, but for preventing disease of any sort nothing is equal to clean, well ventilated quarters, exercise and green feed. To keep your turkeys healthy, feed lightly and make them exercise, but don't dose.—J .A. K.

Sour Milk Mash

Your Cultivator of April 5th contained an article on feeding sour milk mash for baby chicks, by J. A. K., but did not tell ingredients or proportion to use. Would you please give me the exact ingredients and proportions.—Subscriber, Madera.

The sour milk mash to which I referred I think is the buttermilk mash prepared by a local milling company, in which dry buttermilk is an important ingredient. If you prefer to mix your own you can buy the dry buttermilk and mix it with the mill feeds, making it about ten per cent of the whole. A good mash mixture for chicks consists of equal parts bran, middlings and corn meal with ten per cent dry buttermilk and ten per cent beef scrap added. If you have sour milk or buttermilk you can moisten the mash with that, omitting the dry buttermilk, and feed once a day, keeping the mash dry before the chicks the rest of the time. What is known as the Cornell mash, which has been widely used for growing chicks, consists of three pounds each of bran, middlings, corn meal and beef scrap and one pound bone meal. The first two weeks this is moistened with sour milk three times a day and kept dry before the chicks all the time. From the second to the fourth week it is fed moist twice a day, and from the fourth to the sixth week once a day. Chicks do very well on a mash moistened with buttermilk or containing dry buttermilk, without the beef scrap, but they probably grow a little faster if the beef scrap is added.—J. A. K.

Possibly Tuberculosis

Can you give me advice as to cause of my hens dying? They are Plymouth Rocks. They start to limp and get thinner and thinner till they die. We have examined them but find no apparent cause. They roost about 2½ feet above a cement floor. Also have had bad luck in hatching eggs from these hens.—Subscriber, Chico.

Cut open a bird that has died and see if you can find any yellowish white cheesy nodules or raised spots on the liver. If you find them on the liver, examine also the intestines and spleen (the small round, purplish organ just above the gall bladder) for the same thing. If you find them, you will have pretty conclusive proof, in connection with the lameness with which your birds are suffering, and the emaciation which gradually develops, of the existence of tuberculosis in the flock. If you find no such spots you are justified in thinking that the birds are either laming themselves jumping from the roosts onto the cement floor or that they have developed rheumatism from roosting in damp or chilly quarters. In either of these two latter cases you have only to remove the cause. If you find the yellow spots which indicate tuberculosis, there is nothing to do but to kill every bird as soon as it shows the symptoms and burn the body or bury it deep. Move the flock to clean ground and do not try to breed from them. If you cannot move the flock, disinfect the ground with lime and cleanse troughs and fountains with a corrosive sublimate or carbolic acid solution.—J. A. K.

Pineapple Guavas

In response to query as to value of the pineapple guava:

The pineapple guava does not require as much water as oranges as a rule, so says an authority. They do not make as rank a growth as citrus fruits. There is considerable complaint about seedling guavas not bearing. This is due to their natural traits and is only overcome by grafting varieties that do bear. Even seedlings which may eventually become prolific are sometimes shy bearers till they reach mature age. Grafted trees bear earlier than seedlings. Cleft grafting in the spring is the most successful. —J. W. M.

Chicken Ticks

I have discovered on my hens an insect that is neither a louse nor a flea. It sticks tight and fills with blood and is easily mashed. The color is about that of a seed tick and they vary in size, some being as large as the largest louse. Would like to know what they are and how to get rid of

them; The buhach insect powder does not seem to have any effect on them. Have been thinking of dipping my hens in sheep dip for lice. Would it be all right to submerge head?—Subscriber, El Centro.

That insect which is neither louse or flea is probably a tick, the bed-bug of the poultry family and the worst of all insect pests. If the houses are infested, which is most likely, the ticks can be killed by spraying or painting with carbolineum or one of the cresol preparations or with a strong solution of crude carbolic acid in distillate or kerosene. On the birds they are harder to handle, for almost anything that will kill the insect will also kill the bird. Corrosive sublimate is recommended, but it must be used with the greatest care, for it is a deadly poison. It is applied with a brush or feather to the tick, but must not be allowed to touch the skin of the hen. The sheep dip would not be strong enough to kill them, but a thick coating of lard or vaseline might possibly smother them. I have never heard of this being tried, but it kills stick-tight fleas, and I do not see why repeated applications might not be effective. It could certainly do no harm. But it is useless to treat the birds until you know there are no ticks in the house.—J. A. K.

Many Poultry Questions

Please answer the following questions:

1. What is the best method of shipping chicks one month old to Arizona in June. If shipped in the evening and well fed and watered before shipping will it be necessary for me to provide feed and water during the journey?

2. An article appeared in the California Cultivator a year ago advising the setting of all hens that go broody during the months of April and May. My hens are White Plymouth Rocks and have been laying very heavily all winter and spring. They range in age from one to three years old and only one-third of them have gone broody so far this season and I am very anxious to set them so as to give them a little rest. Would you advise setting them later than May if they go broody? I expect to keep hatching eggs during the summer and if I can set them without injurious effects to them I would like to do it.

3. I have been feeding my early hatched pullets plenty of grain in deep litter and keep buttermilk laying mash before them all of the time. They have a variety of greens as much as they want. I also feed a wet bran mash in the evening, sprouted oats at 11 o'clock. Can I overfeed them this way? Would you feed the wet bran mash in the morning or evening and about how much would you feed to fifty pullets?

4. Some people say they feed soaked or sprouted barley and dry mash and no other grain. Is this advisable? Will the hens lay as much if fed in this way?

5. Where can I get an incubator instruction book on the Cycle incubator? Also where can I get a wafer for the cycle? Mine is worn out and I must have a new one.

6. I have a few chicks that were stunted from overcrowding in the brooder. Will it pay me to keep these for layers? They look well now.

7. If milk is kept before the chicks continually what kind of a mash would you advise feeding them?

8. I should like a little enlightenment on vent gleet.

9. I shut another hen in a box painted on the bottom with——lice killer an hour. When she came out she gasped for breath and continued to do so all day. Her left eye is swollen. It is not shut but there is a gummy exudate all over left side of face and wattles. It looks bad but I would not call it either chicken pox or roup. Her abdomen looks very red. I have treated several hens this way for lice and none of them showed any effects except this one and another I put in at the same time. The box had two knot holes for ventilation. —Subscriber, Gardena.

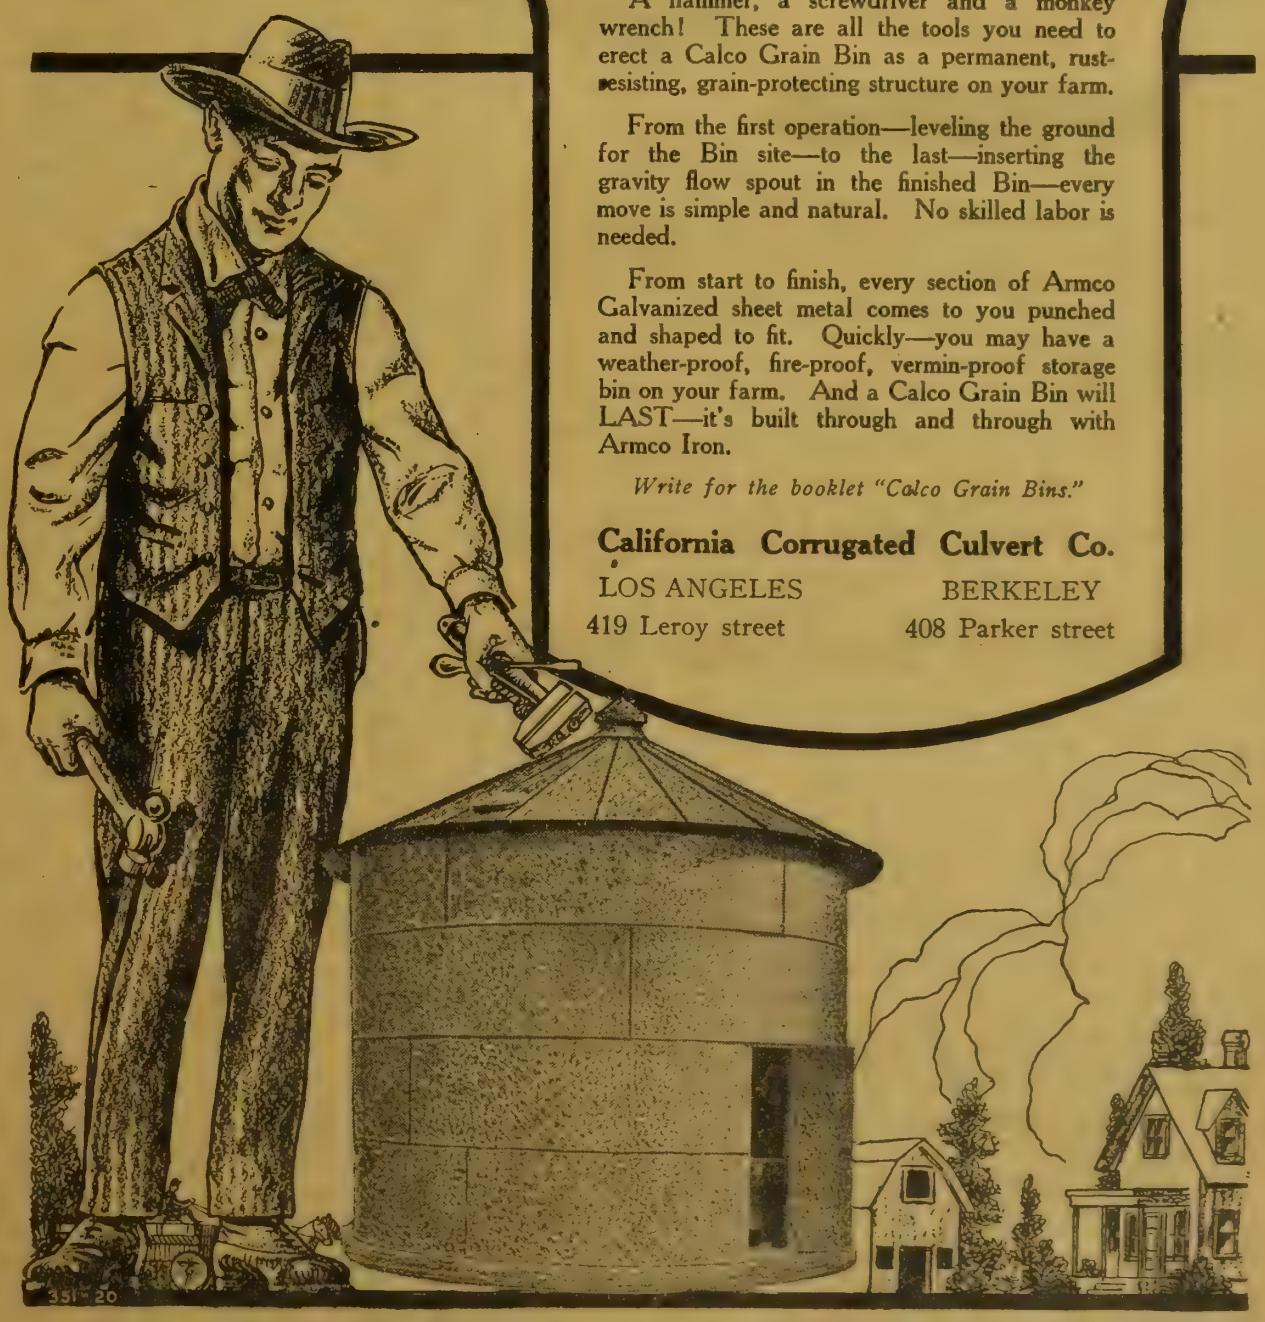
1. The journey is too long for chicks that age to take without food. The best way to manage is to tack inside the shipping crate a can for water and a shallow box or several shallow cans (Crisco cans are good for this purpose) depending on the number of chicks in the crate, and to attach also a larger can or box containing feed. If you tack on the outside a card requesting expressmen to feed and water the chicks at stated times, they will look after them.

2. It can do the hens no harm to set them at any time, but July and August are not very good months for chicks. Many persons do care for chicks right through the summer, however. It is only because it is hard to keep chicks growing well in hot weather that most poultry people prefer to finish thir hatching before May.

3. Pullets need a full ration. You are in no danger of overfeeding as long as they have exercise and plenty of greens. About two in the afternoon is considered the very best time for the moist mash. If it is more convenient for you to feed in the evening you might give them their scratch grain at four or five o'clock and top off with the mash just before they go to roost. If you feed in the middle of the day, give just what they will clean up in fifteen minutes. If at night, give less, for their crops will be already nearly full.

4. My own hens have had no grain but cooked rolled barley and sprouted whole barley for some months, and the limited grain ration does not seem to affect their laying. A variety is to be preferred, however, to a single grain. I think a good many poultrymen feel that we have been overfeeding barley of late, and that, while bad effects are not always apparent, it can be overdone.

5. To get instructor book and missing parts of an incubator you will have to find an agent or write to the manufacturers. They always have them, but no one else is interested.



6. It depends entirely on how badly they are stunted. There is always a chance that such chicks, if they seem healthy, will make fair layers. If they lag very far behind the other pullets it would be better to send them all to market when they reach broiler size.

7. The University Farm chick mash, two pounds each of bran, shorts and meat scrap, one pound each of barley meal and ground bone, and one-quarter pound charcoal is good either with or without milk.

8. Vent gleet is a more or less infectious disease. If I had a hen that I was certain had it I would kill her. It is a troublesome disease to handle and the caretaker stands some danger of infection. But in the case of your hen it may be merely a sore caused by the broken egg. You might try tincture of iodine on the sore a few times. If that relieves it, well and good. If not, do not keep her very long.

9. I killed a hen once with that lice killer. It is very strong in crude carbolic acid and the hens cannot stand being in close contact with it so long. Better be content hereafter with putting it on the roosts if you must use it, but dusting is a much safer and more effective method of getting rid of lice. I think the hen's eye must have been burned by the lice killer. In addition to the boric acid solution you might try putting pure vaseline (the kind that comes in a tube) on it at night.—J. A. K.

This is all you need

A hammer, a screwdriver and a monkey wrench! These are all the tools you need to erect a Calco Grain Bin as a permanent, rust-resisting, grain-protecting structure on your farm.

From the first operation—leveling the ground for the Bin site—to the last—inserting the gravity flow spout in the finished Bin—every move is simple and natural. No skilled labor is needed.

From start to finish, every section of Armco Galvanized sheet metal comes to you punched and shaped to fit. Quickly—you may have a weather-proof, fire-proof, vermin-proof storage bin on your farm. And a Calco Grain Bin will LAST—it's built through and through with Armco Iron.

Write for the booklet "Calco Grain Bins."

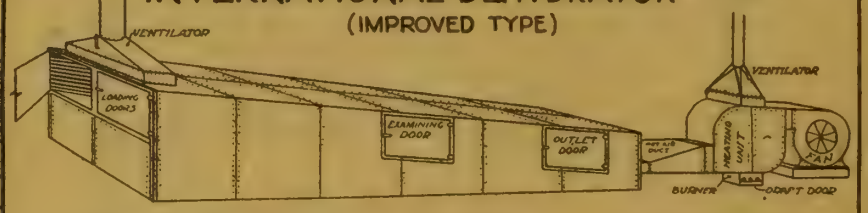
CALCO GRAIN BINS



With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The R. M. Teague
Citrus Nurseries
San Dimas, California
FOUNDED IN 1889

INTERNATIONAL DEHYDRATOR 5 TON UNIT
(IMPROVED TYPE)

Apricots, Prunes, Peaches, Grapes and Vegetables
Tons Will Be Saved This Year by the
International Dehydration Machine

Every FRUIT and VEGETABLE GROWER and all CANNERIES should use this approved method without delay. The establishment of an International Dehydrator in any community is a mark of progressive distinction. "Fifty-four per cent. (U. S. Government Report) of vegetables and fruits that come to maturity are lost."
This machine is not a "toy" nor a "hot box." It is a real commercial proposition. We completely guarantee the perfectness of our equipment.

Marsh Plant.

I am enclosing the root, leaf and flower of a plant of which I would like to know the name.—Subscriber, Riverside.

This is Anemopsis Californica, a plant common along the edges of marshes. The more common name is yerba mansa.

June Beetles.

We are troubled a great deal with June beetles which are very destructive to pepper trees, certain kinds of rose bushes, apricot and plum trees. Will you please tell us what would be good to use as a spray? They bury themselves in the ground through the day and eat on trees at night.—Subscriber, Ontario.

The best remedy for this is a good live bunch of blackbirds. If, however, they prove too serious a pest, spraying the leaves attacked with an arsenate spray is sufficient. Use four pounds of neutral lead arsenate to fifty gallons of water.

Strawberry Plants Dying.

Replying to the inquirer who sent specimen of strawberry plant from patch which seemed to be dying. The plant was forwarded to Prof. Fawcett and he suggests that the trouble may be similar to that of plants near El Monte. This is probably a root trouble which Prof. Smith has found to be associated with a fungus, but is unable to say whether it is the cause of the dying of the plants. I merely mention this as it may possibly be the same trouble as they are now having in San Bernardino but I cannot say from the specimens at hand.

Red Spider on Almonds.

Is there any preparation used as a spray for red spider on almond trees?—Subscriber, Lodi.

The regular commercial lime-sulphur is perhaps the most satisfactory, although many prefer applying lime and sulphur in the dry form. In large orchards this is perhaps more economical. In applying dry, use three-fourths sulphur, one-fourth lime, thoroughly mixed. Apply with power duster. If commercial lime-sulphur is to be used mix with water at the rate of one to 33.

Sulphuring Grapes for Mildew.

Will you tell me when and how often to sulphur grapevines? Does one sulphur the whole vine? When is the proper time to cut off runners?—Subscriber, Walnut Grove.

Prof. Bioletti recommends first sulphuring when shoots are not more than six or eight inches long, a second sulphuring just before blossoming, another immediately after blossoming and another may be given a week or so later, though it is probable if work is thoroughly done the first three will suffice. The proper time to cut off runners, or the ordinary sucker growth, is soon after it appears, or before it has taken a great quantity of nourishment which should have gone to fruit or permanent growth. Do not let them get longer than a foot or two.

Moles.

Kindly tell me how to get rid of moles. They have ruined my strawberry bed and they make it almost impossible for me to irrigate properly.—Subscriber, Walnut Grove.

The only satisfactory treatment of moles is to trap, and fortunately there is a very satisfactory trap with two sets of jaws and strong spring. The trap is so made that when one finds the runway of the mole the dirt may be pressed down with the foot, when the trap is set and the two sets of jaws are thrust into the ground on either side of the pressed down soil. This brings the trap or trigger just above the packed down soil and when the mole comes through his runway and raises the soil the jaws are released so that he is caught no matter from which direction he comes. The kind of trap which thrusts sharp points into the soil has not been so effective in the hands of the writer.

Rolling Onion Tops.

Is it necessary to roll onion tops to make bulbs?—Subscriber.

With regard to twisting onion tops, it is customary with a small acreage to roll onion tops or break them when the onion is nearly of mature size and begins to wilt or show that the top has deteriorated, but so long as the top is green you need not attempt to prevent them from growing large necks. The larger the neck, the larger the onion, and the large neck is a good sign, but it should be broken over before the seed stem appears. The largeness of the neck is determined largely by the variety of the onion. The Globe Onion invariably has a larger neck than the flat onion, and the late onion has a larger neck than the early onion.

Summer Pruning of Grapevines.

Should the ends of grapevines be pinched back to keep them from getting so long? My grapes are not trellised, just bush style, and vines grow from 20 to 40 feet in one season.—Subscriber, St. David, Arizona.

Prof. Bioletti takes the position that in summer pruning of vines there is reduction of vitality and less of real bearing capacity than where the vines are allowed unrestricted growth. However, he has conceded that where the growth is so extremely rank thumb pruning of the ends of the rank growth may be permitted. Certainly there should be some step taken to prevent vines running away with themselves to the extent of 40 feet. This question will, however, be referred to Prof. Bioletti for further answer.

Potatoes All Tops.

Regarding potatoes growing too largely to tops, inquiry regarding which was made from Long Beach, H. L. Musser writes: If the potatoes are planted in soil that is too rich and heavy, particularly when they have too much water, they will make all tops and no tubers. To make this more clear we will say that where there is a low place in a field of potatoes where the water is apt to re-

ARCADIAN
Sulphate of Ammonia

The farmers who used ARCADIAN Sulphate of Ammonia are realizing that they have done the right thing, as their grain is looking fine.

main several days at a time, particularly if the soil is very rich, there will be no potatoes, both because of the richness of the soil and the excess of water. The inquirer has not stated when the potatoes were planted and it is just possible that they are yet too young to form tubers.

Kill the Grasshoppers.

What is the best method of controlling grasshoppers? — Subscriber, Berkeley.

This matter called for quite an extended discussion at the meeting of the horticultural commissioners at the Riverside convention last week. Grasshopper specialist Urbahns gave some information and reported that later careful observations have made it appear that by far the best method of handling grasshoppers is by poisoning. The hopper-dozer and other mechanical methods are expensive and unsatisfactory. Mr. Urbahns recommended that in orchards the poison be distributed in the center and away from trees. Where it is distributed in and under trees the pests are attracted to the trees and do much damage before they die from poisoning. If the pest is very serious and is injuring the trees, beating or disturbing the branches causes them to fly away and many of them to pick up the poison in small quantities on the ground. Do not distribute in large quantities for fear of destroying stock or poultry. A poison which is attractive and succeeds is a wet mash made up as follows:

(1) Bran, 50 pounds; white arsenic or Paris green, 2½ pounds. Mix these dry. (2) Lemons, including rind, chopped fine, ½ dozen; syrup or molasses (cheap), four quarts; water, five gallons. Mix thoroughly by vigorous agitation. For use, mix (1) and (2) and add sufficient water to make a wet mash. They should not be mixed until just before the distribution of the poison. Distribute the mixture early in the morning between four and seven o'clock, as the grasshoppers eat it more readily then. Oranges or vinegar may be substituted for lemons but do not get nearly as good results.

This formula is given in "Injurious and Beneficial Insects" by Essig. The only successful way where an entire community is infested is for this poisoning campaign to be cooperative, for if one grower alone tries to poison for the whole community it becomes a burden. However, go at it alone if the neighborhood refuses to cooperate.

Trespassing Water.

I have an orange orchard adjoining a neighbor who lets his irrigating water run on my property every time he irrigates, and prevents my trees from growing. I have spoken to him several times about his water but he lets the water on just the same. Is there any way I can make him keep his water on his own property or do I have to go to the expense of making a bank to keep it off? Can I come onto him for damages to my trees?—Subscriber, Covina.

This question is not referred to the legal department, for it is simply a case of proving damages which the injured may collect. No irrigator has a right to waste his water to the injury of another, and without question the courts would give relief should the injured party care to ask injunction. But as a more satisfactory way of settling the question the Cultivator would suggest that the foolish irrigator be allowed to continue his practice and that means be devised of putting the waste to valuable use around the trees at the upper end of the injured party's orchard. This water, without question, carries much of fertility from the upper orchard, and we would be inclined to save it and encourage the irrigator to continue his waste.

Tomatoes Dying.

I have some tomato plants from six to twelve inches high. I keep them well watered and cultivated but the leaves of some of the plants are curling under. There seem to be a few small yellow lice on the under side of the leaf but not more than five or six on each leaf. I had the same trouble two years ago, and although the vines continued to grow they produced no fruit. What is the trouble and what remedy should I use?—Subscriber, Fresno.

Presumably this is summer blight. If so there is no help for it. If it is due to the yellow mite to which you refer then spray with a weak solution of Black Leaf 40, directions for which are given on the container.

Corn Ear Worm.

How can I prevent worms from attacking ears of sweet corn?—Subscriber, Madera.

Place in coarse meshed muslin bag a mixture of dry arsenate of lead and sulphur, about 60 per cent of the arsenate to 40 per cent sulphur, which is thoroughly mixed. This bag may then be shaken over the ears of the corn as soon as they begin to "silk out." Repeat this in three or four days, giving very light treatment each time, or perhaps better, although slower than the muslin bag, is the small insect powder blower which may be had at any seed or supply store.

Ants.

Ants are eating the roots of vegetables and squash vines. How may they be controlled? — Subscriber, Fresno.

There are but few varieties of ants which attack growing vegetables but when they do they are a serious pest. The best treatment is to follow the trail back to the hole and by pouring down perhaps a teacup or more of gasoline the entire nest may be destroyed. There are many commercial poisons which are very successful. These have full instructions for use on the container. A very satisfactory formula for destroying ants is three tablespoons of honey and tartar emetic the size of a lima bean. Mix and place in two or three saucers placed where ants are proving troublesome.

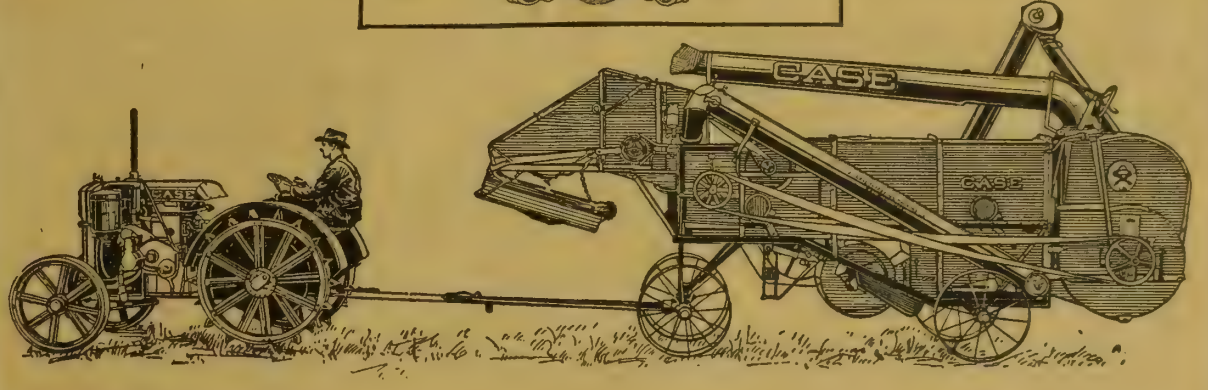
Tanning.

How can I tan sea lion skins?—Subscriber, Morro.

We are unable to make very definite suggestions other than to give the ordinary method of tanning skins. If anyone has had experience with sea lion skin will be glad to pass on the word. But it may be in order to give warning that sea lions are protected by law and may not be killed. The ordinary tanning method is as follows:

Like learning a trade, getting rich and some other things, the tanning of leather requires some experience and attention to details. However, here are a few hints:

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using ten to twelve pounds to a full-sized calf skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak", simply water to remove blood and salt. After being left in this 24 hours the tail and feet may be cut off, and the flesh adhering scraped off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime. When thoroughly slaked and mixed, immerse the skin and allow to lie for three or four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitrol, alum and salt, one tablespoon each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neat's foot oil or currier's oil. It may again be washed out in soapsuds and hung up until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds.



This will give a raw hide which may answer. However, if it is desired to have the leather more perfectly tanned, after ringing out of the suds and before oiling, place in vessel and take of sufficient water to cover, in which has been thoroughly mixed one pint of this mixture. "For a 12-pound calf skin take terra japonica, three pounds; common salt, two pounds; alum, one pound. Put these in a copper kettle with sufficient water to dissolve. Boil." Pour the water above referred to, which has been mixed with a pint of this mixture, over the skin. Every 12 hours take out the skin and add another pint of the tanning mixture. Do this three days, then add the entire amount which has been left of the tanning mixture. If it is desired to darken the leather add one pound of Sicily sumac. Of course the leather should be handled often in this mixture. In addition the drying should be gradual and working with the hands as it becomes nearly dry aids in stocking the leather.

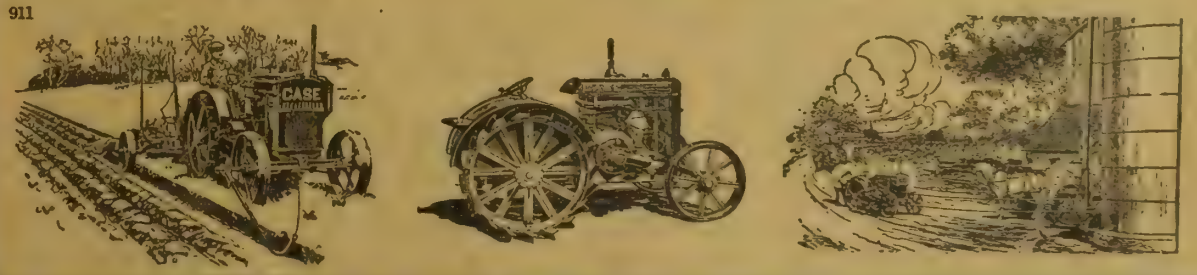
CASE

This Efficient Case Outfit
For Quick and Satisfactory Threshing
The Case 10-18 Tractor and Case 20x28 Thresher

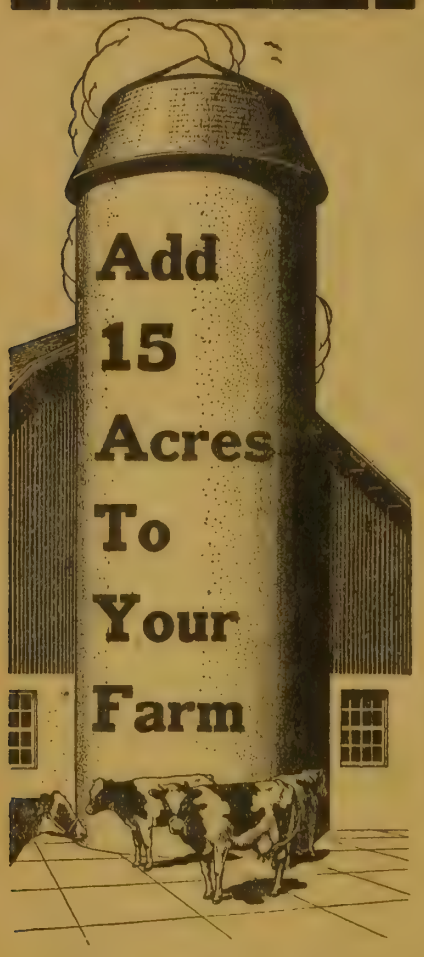
For a reliable, small threshing rig use a Case 20x28 Thresher driven by a Case 10-18 Kerosene Tractor. This well known combination will save you valuable time in the rush of threshing days. It will do a thorough, economical job and enable you to thresh at a time most convenient and profitable to you.

The Case 10-18 Tractor provides the even power to run a thresher steadily, as it should be run. The friction clutch belt pulley (fitted with brake) is mounted on crank shaft, the logical place for it.

It is equally well adapted to all drawbar work —such as plowing, disking and seeding, hauling, road grading, etc.



A governor-controlled, four-cylinder valve-in-head Case Motor is mounted crosswise on a one-piece main frame. This engine can develop at least 20 per cent more power than its rating.



The Case 20x28 Thresher pictured above is built of steel. It is a simple, easy-running machine, noted for perfect separation, cleaning and saving. Operated with a Case Tractor it is an ideal rig.

This outfit in your hands will enable you to do your threshing at your own convenience without loss from delay. Ask any Case dealer about it now. We will send you a catalog free at your request.

J. I. CASE THRESHING MACHINE CO., Inc., FOUNDED 1842 1905 Erie St., Racine, Wis., U. S. A.

Concrete for Permanence

Some Essential Facts in Successful Live Stock Breeding

By R. P. Royce

THERE is no gainsaying the fact that more interest is being manifested in better live stock throughout this state than ever before. From all sections come reports of new men planning to enter the pure bred business and among the established breeders there is a very marked effort to improve their herds and flocks.

One can not view the situation and fail to register satisfaction. The more general introduction of better blood through pure bred cattle, hogs and sheep means much for the general prosperity of the state and the opportunities open to the California breeder are such as to assure a bright, and in some cases, a brilliant future.

The degree of success the breeder may attain will in a large measure be entirely dependent upon the intelligence he gives the business—just as the success registered in any other line of endeavor depends largely on the individual. The really successful men engaged in any line of work are not numerous, at best, and the percentage of successful live-stock breeders is no higher than the percentage of successful merchants, doctors, lawyers or other professional men—perhaps not as high. The business of producing pure bred live stock is not an open road to wealth—on the other hand there are as many opportunities to make a marked sucess, measured either in dollars and cents or constructive accomplishment as are presented by most lines of effort. It is not difficult to call to mind many instances of breeders who have made fortunes, and in each case an analysis into their successes would indicate that intelligent effort, and a close application of fundamental principles were responsible, rather than luck.

On the other hand there have been many notable failures recorded in the live stock industry and an analysis of the causes will disclose an utter disregard of sound principles and an astonishing lack of common sense.

There is a fascination about the live stock business that is not found in most lines and the fascination exerts a strong pull on most men. Outsiders see the glamour, the shows, the sales and the good fellowship, they hear of the successes of many breeders and it all looks so easy—so attractive—they take the plunge—for "better or for worse."

I have known many men who have made a marked success in various businesses who, when they decided to enter the breeding game apparently cast aside the very principles upon which were built their former successful operations. I recall one case in particular—rather recent, too, when an investment running into six figures was made in live stock before the investor knew even the rudiments of the business. I can recall many men who have made investments running into the thousands who turned the plant over to the cheapest manager they could find and who later became disgusted with the business and after a short time closed out at a sacrifice of much money and time, and declared the live stock business held no opportunity. Is it not strange that so many men will enter the business in such a haphazard way when; if they were making an equal investment in bank or factory they would give the closest study to the new venture and attempt to secure the best manager? Would many men invest in machinery and raw material before they had arranged for a suitable site and building? Not many; but I have known men to enter the live stock business on such a basis.

Contrast these unfortunate ventures with the hundreds of cases of young men, and older ones, too, who have built up important herds and flocks from small beginnings. Nearly every community can claim at least one such case. Many are the farms that have been paid by the money earned by pure bred live stock. If one takes the trouble to investigate the reasons back of the general run of successful stock breeding ventures he will be impressed with the fact that nearly all are due to the persistent application of the established fundamental principles.

Perhaps, by this time the reader is beginning to wonder what these fundamental principles are. The writer doubts if he can name all the factors, but he believes that he will name the most important—perhaps not in the order they would be set down by others—but in the order that his experience would indicate to be about correct. They follow:

First: It is necessarily fundamental to success that the man entering the live stock business haye a deep rooted liking for the business. Unless one really likes the work in hand, he lacks enthusiasm and without enthusiasm any business will fail. It is quite true that one can develop enthusiasm as he progresses.

Second: He must have a suitable location. By a suitable location is meant that the farm on which the breeding operations are to center must be capable of producing the kinds and quantities of feeds necessary to economically maintain the live stock. The man who has the opportunity to select his farm should keep the above facts in mind and at the same time consider the accessibility of the farm to established live stock centers. A well located farm is an asset—though not a necessity. Consideration should be given the existing equipment, and if new equipment is added it should be of a type proven successful, yet not represent an investment that would make the overhead charges too great—thus handicapping the business at the outset.

Third: A careful preliminary study of the history of the breed selected, past and present, and a study of the principles of breeding.

The value of such a study must be obvious. Unless one familiarizes himself with the knowledge of how the breed was established and the various steps made in the improvement of the breed to the present standard he can not hope to make progress. Such a study will also familiarize him with the men and the individual animals who have been the high lights of the breed's improvement and he will be in a position to judge the value of a pedigree much more accurately than if he lacked the intimate acquaintance with the breed history. A knowledge of the sound principles of breeding is fundamentally essential to any success. While the mere grasp of these principles does not insure success it does serve to mark the way and to indicate the reasonable possibilities and limitations of the business.

Fourth: A knowledge of the accepted type and the popular blood lines.

At first glance it might appear that accepted type and popular blood lines go hand in hand. They do to a certain extent, but it is a fact that an animal might be of such rare individual excellence as to win in the show ring and yet be backed by a pedigree not held in esteem by the best breeders. The progeny of such an animal would not be sought after nor valued as highly as one backed by a pedigree considered more highly. In this connection it might be well to state that from time immemorial there has been a deal of poppycock thrown around certain lines of breeding—mere pedigree fads—but as a general proposition it may be set down that the more popular lines of breeding are the ones that experience and time have proven to be the most valuable. Therefore it is important that the beginner learn to distinguish between good and bad pedigrees.

Fifth: Reasonable capital or financial backing.

The live stock business is not unlike any other business. Capital is required to operate sucessfully. Occasionally one can register a success on a shoestring but the margin of safety is too small. The amount of capital one has will govern the extent of his operations. Ordinarily one makes a mistake by attempting to spread his capital out. A few high class animals are usually better in-

vestments than a larger number of plain things.

Sixth: A knowledge of prevailing values.

Obviously one's success will depend very largely upon his ability to buy and sell. One of the best methods of gaining this knowledge is by attending public sales and seeking advice from reliable breeders.

Seventh: A study of the operations of successful breeders.

A careful study of the methods followed by men who have made notable successes constitutes one of the valuable lessons the beginner can learn. It will be found that most of the successful men follow practically the same plans. They have assembled herds and flocks uniform in type, of good pedigrees, and invariably are good feeders. Their publicity and selling methods may differ, but the general character of their live stock is very much the same.

Eighth: An appreciation of the fact that proper feeding is of prime importance.

Unless the man already in the business or about to enter realizes the importance and necessity of proper feeding he is doomed to failure. I care not how well fed the herd or flock may be, how uniform they are in type, how much they cost or their show yard record, unless the owner is willing to provide feed—proper feed and in abundance—he might just as well stay out of the game. Feeding and breeding go hand in hand and every great breeder is a past master of the art of feeding. Some beginners, assume that because they have heard that pure bred live stock can make greater gains on the same amount of feed as scrub stock that it is not necessary to feed them. It is true that improved stock are more efficient at the feed bunk than scrubs, but they need the bunk!

Ninth: Be willing to give the business your best attention or engage the services of a competent man.

The pure bred business will not run itself, although it will come nearer doing so than most businesses. The men who are responsible for the improvement of the various breeds are men who have given their best efforts to the work. The live stock business does not stand still, it either goes forward or backward, and such being the fact it can not be assumed that one's herd will go forward unless he is willing to give it the attention that the men behind the breed have. Either one must be willing to give his own time to the herd or be willing to pay the price necessary to secure the services of a competent man who will give it the care demanded. Such men are worth more than $75 or $100 per month. Would you be willing to turn over a $25 000 or $50 000 business to the management of a cheap clerk? But, some say other businesses are more intricate as well as more profitable. The writer does not admit as much. No business is more intricate or capable of returning greater dividends than a properly established and conducted breeding farm.

Tenth: Do not be impatient for financial returns.

When one enters the live stock business he must be prepared to give the business time to get under way. The breeding business is essentially dependent on time.

Eleventh: Publicity.

The pure bred live stock business is as much dependent on publicity as any other business. Occasionally one can register a success without advertising his goods, but invariably his success would have come quicker and been greater had he given his product publicity. Publicity can best be gained through high class farm journals, and by exhibiting at live stock fairs and shows.

Twelfth: Character.

There is no business that rests so completely upon the character of the men engaged in it as does the live stock business. The whole fabric is based solely on the integrity of the breeders as regards honesty in the matter of breeding, ages and health, and it is to the everlasting credit of the great majority of the men engaged in the business, past and present, that the business has survived and grown and improved each year, with a minimum of unsavory practices disclosed. The average man engaged in the pure bred business represents the highest type of manhood.

Thirteenth: Personality.

Personality is important and essential to the success of any business, but it is doubtful if any other business will react quicker to the personality of the man than will the pure bred business. The reason for the above statement can be found in the fact that most live stock transactions are consummated in a rather intimate way and the personal qualities of the buyer or seller—or both—measure in a large way the success of the transaction. Again, breeders, newspaper men and others come into close contact with each other and the impression gained at the first meeting or subsequent meeting will unconsciously be used for or against the individual. In no business will those engaged manifest a closer good fellwship than in the stock game and it's the big, clean, broad minded man who attracts the widest circle of friends.

From all the foregoing the prospective beginner might assume that it will prove a formidable task to establish himself as a breeder. The writer does not mean to convey such an idea—what he seeks to show is that the pure bred live stock business is a business capable of returning handsome profits and a wealth of satisfaction and pleasure, but that it deserves the best efforts of those engaged in it.

Economy and Efficiency

One of the greatest problems a milk producer has today with the high cost of both feeds and labor is how to cut operating expenses to the minimum that milk may be produced at a slight profit.

Burr Farm is owned jointly by E. Burr of the Burr Creamery and G. M. Brown and located on the eastern outskirts of Los Angeles. G. M. Brown, the manager, states that the farm, along with 300 good Holsteins, was purchased about a year and a half ago and at the time of purchase was losing money every day it was operated. The farm being small and devoted entirely to feed lots necessitates the purchase of all feeds. Mr. Brown says:

"We began by putting every cow on strictly hay feed and by weighing and testing those in milk that we might determine the profitable cows. We maintain a ration for each cow according to her ability to produce milk, all feed being weighed, accurate account kept and every cow tested once a month. By working out an accurate system of costs, systematizing our labor and getting a record of production of each cow we reversed the operation of the farm from a loss to where it showed a slight profit.

"We have been gradually replacing our grades with pure breds until now we have over 100 head of pure bred Holsteins, eighty of which are now milking. We have about thirty cows with records of from twenty to thirty pounds. We also secured as senior herd sire Sir Veeman Pontiac Korndyke, a son of that noted bull, Sir Veeman Heugerveld, who is the sire of more thirty pound cows than any other living bull.

"Our herd now averages one pound of fat per cow per day and one-fifth of these are heifers with their first calf. From a production of forty ten gallon cans of milk per day we have increased it to ninety-five with the same number of cows milking.

"We expect to make Burr Farm a breeding plant of pure bred Holsteins and every grade now on the farm will be replaced by a pure bred just as rapidly as possible." In addition to about seventy-five head purchased at private sales, Mr. Brown has been a liberal buyer at all the recent sales of pure bred Holsteins, including the Guarantee Sale at Sacramento. Thirteen head were purchased at the McAlister dispersal sale.

Dairymen in the district supplying Tacoma and Seattle are getting the biggest prices ever. Even Portland dealers are coming to them to compete with Washington consumers for their product.

It Pays to Salt Your Hay When Stacking or Baling

Cattle Eat Up Salty Forage Clean

(From Pacific Rural Press)

"An ounce of salt a day in the ration is all right for cows," says G. L. Stearns, formerly of the Vina Ranch. This is probably not enough, so there ought to be some stock salt in the yards for cows to eat at pleasure. Sometimes in feeding cows for official test, as much as three ounces per day is mixed in the feed. This makes the cows thirsty and they drink more water and produce more milk. But it is necessary to be very careful in feeding salt in the ration, for it is apt to give them the scours and is also likely to cloy their appetite so that they will not eat enough to make a record yield of milk.

Two crops of fodder per year, which the stock eat up clean, are grown by a settler on the Natomas Consolidated project in Sacramento County. He grows pure bred Duroc hogs and Shetland ponies, and claims that his oat hay cut early in May yields three and one-half tons per acre. Immediately after it is cut, corn is planted; and if this doesn't mature it is cut as fodder when the kernels have dented. The ears are taken off and the stalks stacked in the yard with a large amount of salt, which induces the stock to eat it more completely than otherwise. His neighbor, Mr. Jensen, salts his threshed wheat straw, which the cattle eat clean. Leading dairymen use salted alfalfa hay the year round for feeding dairy cows to increase the flow of milk.

The amount put into hay in stacking depends on the amount of hay each animal is expected to eat.

Twenty pounds per ton in general may be all right if the stock has plenty of other food. But a cow which has nothing but hay will eat five tons per year if she weighs 1200 pounds, according to Mr. Stearns. At the rate of 20 pounds per ton, this would force the cow to eat a trifle over four ounces per day, which is altogether too much.

When it seems that there is danger of too much salt in the feed, a satisfactory test may be made by offering salt separately; and if the cow doesn't eat it, less of the salty feed may be given until she will.

Cross-section of hay stack showing how salt should be applied every 3 feet

Imported and American Bred

Percheron, Belgian and Shire Stallions

A large collection of Stallions ready for service this season. Heavy boned types with plenty of style and action. Prize winners and descendants from prize winners. No better in America.

Second Public Sale

Lady Ruberta—In This Sale

45

Scotch Shorthorns

42 Females—3 Bulls

State Fair Grounds
Sacramento, Cal.

Thursday, July 10, 1919

In this sale Mr. W. M. Carruthers will afford established breeders and those about to establish high class herds an opportunity to secure, right here at home, a splendid selection of Scotch cattle that will compare favorably with the best eastern offerings.

A New Standard of Shorthorn Quality in the West

Both as to individuality and breeding this sale will set a new high level for Shorthorn quality in western public sale offerings, and it comes at a time when investment in registered beef cattle is one of the most promising in the agricultural field.

HALLWOOD VILLAGER
one of the great younger sires of the breed will be a feature of the sale. He should make a fortune for some breeder.

Everything tuberculin tested and guaranteed to be breeders.

The cattle are now practically all on the sale grounds. Call and look them over any time.

Catalog free on request.

October 29, Tulare County Poland-China Breeders' Association, Tulare.

Berkshire Swine

August 2, Butte City Ranch, Butte City.

Shropshire Sheep

August 2, Butte City Ranch, Butte City.

Duroc-Jersey Swine

July 16, Tulare County Duroc-Jersey Breeders' Association, Tulare.

Tulare County Poland-China Sale

October 29 has been set by the Tulare County Poland-China hog breeders for their first pedigreed consignment sale, when the recently formed organization will offer its choicest animals at auction. The tentative date of October 9, which had been considered, was abandoned so that the sale would not come during the week of the live stock show to be held in Tulare October 6 to 11 and the carnival to be held the week following at Visalia. The sale will be held at the sales pavilion of the Tulare County Live Stock Association at Tulare. This pavilion is now nearing completion and will have accommodations for 150 head of hogs in specially constructed stalls, with concrete floors and special attention paid to drainage. It will be 50 by 90 feet and will have a big show ring, a special auctioneer's stand and seats for several hundred persons. By means of a "class" committee which will pass on all stock consigned to the sale 60 days before the date and again the week before the animals are to be sold, the directors of the association believe that only the finest Poland-Chinas in the county will be put up for sale. All pedigrees will be guaranteed. H. C. Shinn of Tulare is the association secretary.

Tulare County Duroc-Jersey Sale

To inaugurate the new $10,000 sales pavilion of the Tulare County Live Stock Association at Tulare the county Duroc-Jersey breeders' association will hold a consignment sale on July 16. Sixty animals, representing the best of the breed, will be put up at the sale.

Good Bull Transferred.

Guy H. Miller reports that he has sold the fine young Jersey bull Juanita's Majestic Noble to Miss Rose E. Crook of Makawao, Hawaiian Islands. This young bull is out of one of his Register of Merit and prize winning cows, in fact his dam and both granddams have good yearly records. Miss Crook selected this young bull to use on daughters of Amethyst King, an excellent bull selected from the Miller herd several years ago.

$10,000 Premiums for Grain and Forage.

The Chicago board of trade, desiring to stimulate and improve grain and forage production, offers $10,000 in premiums to exhibitors of grains and hay at the International Live Stock Exposition of Chicago during the first week in December. The manager of this exposition promises to stage a show of grains and forage which will in all respects be on a par with the wonderful exhibits of live stock annually assembled at this, "The World's Greatest Live Stock Show."

By having these powerful influences cooperate, an exhibition of grains and forage may be looked for, the equal of which has never been seen anywhere.

Madrigal Mooike Second

32.77 pounds butter at three and one-half years and still on test. Owned by W. J. Higdon, Tulare.

Eleventh Daughter in R. of M.

Guy H. Miller of Modesto writes that Ila of Venadera, a two-year-old daughter of his herd sire, Altama Interest, has just finished a year's test, making 319 pounds of fat, beginning at 24 months of age. Milked twice daily and ran out with the herd summer and winter. She is the eleventh daughter of Altama Interest to qualify for the Register of Merit.

New Ayrshire Breeder.

Prof. J. M. Culpepper of Modesto is founding a herd of registered Ayrshire cattle and has purchased four cows and a bull from E. B. McFarland of San Mateo, as a foundation.

Promising Heifer

The Burr Farm has just completed

Coloma Beauty Butter Maid

34.77 pounds butter in seven days as a junior four-year-old, record just completed. Owned by W. J. Higdon, Tulare.

a record for their three year old cow, Stratford Segis Blanche De Kol 2nd—that they purchased at the Guarantee Sale. Her dam is the 30 pound cow, Stratford Segis Blanche De Kol purchased by the Carnation Stock Farms of Seattle at the same sale for $1000. The Burr Farm cow produced 573.7 pounds of milk, 22.93 pounds of butter in seven days increasing her record from 317 pounds of milk and 14 pounds of butter as a two year old.

Annual Meeting American Guernsey Cattle Club.

The 42nd annual meeting of the American Guernsey Cattle Club was held in New York City on May 14, 1919. Approximately 200 members and breeders representing 21 states, also the Dominion of Canada, were present at the business sessions. Among the states represented were Florida, South Carolina, North Carolina and Virginia, with a combined attendance of 16 breeders.

The secretary reported that registration of cows and bulls during the fiscal year 1918-19 totaled 16,281, an increase of five per cent over the registrations made during the previous fiscal year. During the first six months of this fiscal year, the period just previous to the signing of the armistice, registrations were made at the rate of 1242 per month, as compared with a rate of 1369 per month during the corresponding period of the previous year, and 1471 per month since the armistice was signed.

The transfers totaled 16158, a gain of 9.3 per cent over last year. Total of 9298 transfers was recorded during the last six months of the fiscal year and only 6860 were recorded during the first six months.

Argentinan to Judge International "Doddies."

A cable to Secretary Charles Gray of the American Aberdeen-Angus Breeders, Association, Chicago, informs him that William J. Grant has been chosen by the Rural Society of Argentina to come to Chicago and judge the Aberdeen-Angus breeding classes next December. Mr. Grant comes from the Scotch Grants who have done so much to write Old Country Aberdeen-Angus history, and he has done much to boost the Blacks in the Argentine, where they are just beginning to get a foothold.

Ayrshire's Upward March

The motto of Mauchlin's Snowdrop 2d, an eight year old Ayrshire cow owned by the Connecticut agricultural college might well be "Forward, Upward, Onward." That characterizes her work during the past five years. She has just completed her fifth entry in the Ayrshire Advanced Registry with a production of 14,680 pounds milk, 618.53 pounds fat, 4.21 per cent test. Her five records on a cumulative basis average 11,338 pounds milk, 505.27 pounds fat.

Record Hereford Sale.

On May 21-22 Warren T. McCray, Kentland, Indiana, sold 120 Hereford bulls and females for $436,250, an average of $3635, a new high record for beef cattle. The top bull was Baron Fairfax, by Perfection Fairfax, selling for $24,000. Hugo Fairfax, also by Perfection Fairfax, sold for $23,000; Admiral Fairfax, by the same sire, fetched $20,500 and Luther Fairfax, another half-brother, sold for $19,000. The top female, Miss Dale Farmer, by the imported bull Farmer and bred to Perfection Fairfax, sold for $10,500.

Record Angus Sale.

While Herefords were breaking records in Indiana, the Angus clan gathered at Holbrook, Iowa, and paid the veteran breeders, P. J. Donohoe and Sons, $121,425 for forty-seven head of females, an average of $2583, the new record for the breed. Blackcap Lassie 16th, a two-year-old daughter of Black Engraver and Blackbird McHenry 74th, was purchased by R. W. Plummer of Iowa, for $7,200, the highest price ever paid for an Angus female. Elba of Glyn Mawr 4th was taken by A. D. Wilcox of Kansas, at $6300.

Prof. Thompson Selects Durocs

The Elliott-Brant Rancho has recently received a shipment of a young boar and five gilts from the Duroc-Jersey herd of H. P. Slocum and Son, Willows.

The boar is by King of Orions and has been named May Rose King as the name May Rose has been adopted as prefix for all their Duroc-Jerseys.

They were selected by Prof. J. I. Thompson of the University and were from the number recently purchased by Slocum and Son in the East.

New Herd Boar

Fred Hartsook, Poland-China breeder, has added to his herd the 1000 pound boar, Big Smooth Jumbo. He recently shipped a boar and sow pig to Albert Jones, Lancaster.

Establishing New Herd

R. F. Bradley of San Bernardino, who some time ago established a herd of pure bred Holsteins, and was a liberal buyer in the late guaranty sale, Sacramento, is also building up a herd of Duroc-Jerseys. At present he has fifteen young sows with litter at side and is developing for his future herd sire a young boar by Great Model out of Grand Lass by P. L. W.'s Golden Model.

Berkshire Booklet by California Breeder.

The American Berkshire Association has issued an illustrated booklet "Why I Breed Berkshires." The contents is a reprint of an article written by Frank B. Anderson, Sacramento, secretary of the Western Berkshire Congress. Copies of the booklet may be obtained by writing Secretary Frank H. Springer, Peoria, Illinois.

Buys Prize-Winning Berkshire Sow.

W. F. Sandercock, Sacramento, owner of the Natomario Rancho herd of Berkshires, has recently purchased from W. M. Carruthers, Live Oak, the sow, Live Oak Laurel, first prize junior yearling sow at the 1918 California State Fair. Live Oak Laurel was sired by Ames Rival 100th and her dam is Forest Grove Laurel. It

(Continued on Page 821.)

The Real Reason WHY!

We have more than doubled the milk production on Burr Farm the past year due to good cows by good sires. Our senior herd sire, Sir Veeman Korndyke Pontiac, is a son of Sir Veeman Hengerveld, the sire of more 30-pound cows than any living sire.

We can supply you a young bull, priced reasonable, bred for increased milk production. Address:

BURR FARM Los Angeles, Calif.

PRINCE WALKER CORNUCOPIA

Correct Individuality---Rich Dairy Inheritance

The above illustration is from an untouched photograph of PRINCE WALKER CORNUCOPIA as he appears today in two year old form. He has been pronounced one of the best individual bulls of the breed in the west by numbers of competent judges.

The richness of his breeding is fully in keeping with his great excellence as an individual, and he combines these qualities in a rare manner.

His Sire:

Prince Gelsche Walker

sire of some of the best producing heifers of the breed, including the famous 36 pound three year old, Miss Valley Mead De Kol Walker, who made over 1100 pounds butter in one year, winning the California Dairy Competition over all ages and breeds. Her son sold for $6500 at public auction. Another of his daughters, Lady Hiske Walker, made over 34 pounds butter in seven days as a four year old and her young son sold for $2400 at public auction. Five yearling daughters of Prince Gelsche Walker have sold at public sale in California for a total of $6800, an average of $1360, a record not closely approached by the daughters of any other bull. Prince Gelsche Walker also has a 31 pound granddaughter, and a 24 pound two year old granddaughter that milked over 99 pounds in one day.

His Dam:

Alba Sadie Cornucopia Creetia

one of the great producers of the breed. She has the following records to her credit:

At nine years—	
Milk seven days	516.70
Butter	36.21
At Seven years—	
Milk 338 days	18,849.40
Butter	866.28
At six years—	
Milk seven days	532.40
Butter	34.13
At five years—	
Butter seven days	28.85

She is the only 36 pound cow in California that has made over 34 pounds butter in seven days at a previous freshening. She is a daughter of Sir Sadie Cornucopia, whose dam was the first 30 pound cow, Sadie Vale Concordia, who in turn produced the 40 pound cow Sadie Vale Concordia 4th, who has a 38 pound daughter and is the dam of King Korndyke Sadie Vale.

PRINCE WALKER CORNUCOPIA will be given every opportunity in this herd, which is constantly increasing in size, over 60 high class cows and heifers being now in calf to him, and some of his young sons and daughters already in the herd.

Steady demand has kept our supply of bulls down to the service age limit, but we have some desirable ones nearly old enough for service. Write for prices. We have been able to please many dairymen who have purchased bulls from us.

Dairymen's and Poultrymen's Picnic

By M. E. Bemis

Dairymen and poultrymen joined in a picnic at Eastlake Park in Phoenix, Arizona, May 24. About 500 were present. Basket lunches were served at noon and ice cream was served by the several associations.

Sortly after 1 o'clock Judge J. C. Phillips welcomed the visitors in an apt and humorous speech and as toastmaster introduced the several speakers. E. F. Van Kirk, as president of the Maricopa County Dairymen's Association, told of some of the struggles of the dairymen and the need of an organization. He also urged the attendance of dairymen at the regular meetings of the association and expressed a hope that this picnic would be the beginning of a better get together spirit on the part of dairymen. President H. E. Geare of the Phoenix Milk Producers Association made his maiden speech. He also made a hit, for in a few words he told of the problems of the retailer and the necessity of getting together, not only in an organized way but in a social way, and expressed the hope that this picnic would be the beginning of an annual affair to be held each season.

E. Draper of Glendale, president of the County Poultry Association, told something of the value of the poultry products and their worth as a human food, and touched briefly on the problems of making the business more profitable. He read a letter from one of the largest dealers in the Salt River Valley showing that the quality of eggs has increased 20 per cent during the past year. From these figures which he gave it is estimated that the eggs of the Salt River Valley bring the producers more than a quarter of a million dollars annually. Mr. Draper pointed out how by better feeding, better care of the eggs and by organization that the poultry business could be made far more profitable, and urged every poultryman present to join the association.

Rev. W. S. Buchanan delivered an address in his inimitable style, enlivening it with pointed anecdotes and holding the attention of all the people in the park.

State Dairy Commissioner W. A. Barr told of some of the rather extraordinary cases of lack of proper dairy sanitation found in some of his inspection work. This emphasized the importance of cleanliness and the profitableness as well. W. A. Warriner, Sr., has made almost a lifetime study of silos, and in a brief talk told of some of the advantages of building silos.

Captain Kenney, poultryman of the Arizona college of agriculture, gave a most interesting demonstration of Hoganizing laying hens and extended an invitation to all poultrymen to bring their troubles to the poultry department of the college and assistance would be given if possible. Professor N. J. Harris, extension poultryman, working cooperatively with the United States department of agricultural extension, told of some of his work in Arizona among poultry keepers.

Professor W. S. Cunningham, dairyman of the Arizona college of agriculture, by means of illustrated charts explained why milk tests vary. George Eliot Miller had for his subject "Skim Milk a Commercial Product." He gave some most illuminating figures showing that skim milk, which is commonly regarded as a by-product of the dairy of but little value, actually has more protein food value than all the beef consumed in the United States in a year.

Dr. J. C. Norton spoke of "The Troubles of the Retail Milk Dealers" and showed that while prices of milk had advanced, that feed and labor costs had advanced far beyond. W. W. Carney, a veteran poultryman and also a successful cotton grower, was given the subject, "Chickens Versus Cotton," and handled it in a most creditable manner.

L. G. Galland of the Valley Bank, on the topic, "The Banks and the Dairymen," made a short talk that showed his familiarity with not only dairymen and banks but with cows as well. His talk was one of the best of many good ones.

The crowd left immediately following the close of the program, voting it a most enjoyable occasion. The success of the combined picnic was due, in a large measure, to the untiring work of E. E. Quick, chairman of the finance committee; E. F. Van Kirk, Mrs. W. A. Wilson and W. F. Fetterly.

Berkshire Sales Scheduled

By Frank B. Anderson, Secretary Western Berkshire Congress

The Western Berkshire Congress announces its fourth promotion sale for Salinas, Saturday, June 28, during the Rodeo and "Big Week" celebration.

J. Francis O'Connor, director in charge of promotion sales, made the Santa Rosa sale quite a feature, having a program of speaking entertainment in store for the breeders and their friends.

Lou G. Hare, a breeder of Salinas, says that the Roedo officials welcome the Berkshire Congress, as it will not only bring some good animals into their stock show, but spread pure bred hogs in the community.

Thirty small Berkshires averaged $45 at the Dixon sale, May 17, most of them going to farmers who had no pure bred hogs. R. C. Gruhlke, secretary of the Solano County Farm Bureau, looked after the local arrangements for the sale and Ord L. Leachman of Sacramento officiated as auctioneer.

The consignors were R. C. Gruhlke, Dixon; J. Francis O'Connor, Santa Rosa; A. L. Stephenson, Los Molinos; A. B. Humphrey, Escalon; George M. York, Modesto; E. H. Whiting, Ukiah; R. J. Merrill & Son, Morgan Hill; W. F. Sandercock, Sacramento; George A. Murphy, Perkins; George P. Upham, Martinez; Frank B. Anderson, Sacramento; Anchorage Farm, Orland.

The buyers were John A. Fogarty, Davis; T. A. Kilkenny, Dixon; A. L. Harris, Dixon; Conaway Ranch, Woodland; American Hog Company, San Francisco; Fred J. Stewart, Martinez; Charles Hay, Dixon; R. C. Gruhlke, Dixon; D. T. Jenkins, Dixon; John S. Cannon, Suisun; Ord L. Leachman, Sacramento; G. D. Reimer, Dixon; George W. Vaughan, Antioch.

DEVELOPING A HERD

In speaking of the development of a breeding herd, R. K. Walker, manager Winsor Ranch, Bonita, states it is their idea to enlarge and improve their herd by careful selection of young animals bred and raised on the ranch.

Mr. Walker says: "At times it may be necessary for the infusion of new blood to purchase a few outstanding animals but in this there is always the danger of importing disease. Our policy in the future will be the development of all animals to the size and age that will enable us to determine whether or not they measure up to our standard as breeding animals.

A tract of alfalfa has been divided into one-third acre lots, shade provided and running water in concrete drinking vats in every lot. Both the breeding herd and the young animals

The ranch recently shipped to the Southwest Cotton Company, Phoenix, Arizona, two young boars by the herd sire Great Model.

The Silo for the Readjustment Period

By A. L. Haecker

Economic production of stock and stock products is one of the important problems connected with the readjustment period. Agricultural economy will be studied more closely during the next few years than it has been during the past. The need for a greater supply of both meat and milk, not only as food for this country but also for foreign demands, will require that we keep more live stock on the farm. This is also required as a land builder and a better use of our cheap raw materials. Any equipment or plan of agriculture which will tend to lower the cost of both stock and stock products will be favored in this readjustment period. A glance at the live stock sales going on over the country will illustrate that this idea is clearly held by many of our leaders in rural affairs. All kinds of pure bred live stock are in great demand. New herds are being founded and new interest being taken in the breeding and feeding of live stock. The silo has always proven of first importance when good and economic feeding are required. For this reason we can expect a revival in silo building. As the farms become divided and made smaller, more intensive farming is required. Greater economy must be practiced and the wasting of feed cannot be tolerated. There are crops of forage such as millet, sorghum, kaffir, oats, peas, cow peas, soy beans and Sudan grass, which can be stored in the silo better than in any other form. Silage makes the cheapest substitute for hay and pasture. This has been well demonstrated and has been proven of such value that many farmers and dairymen have reduced their hay requirements half and their pasture even a greater ratio. Only the best pastures have proven a profitable crop. Good land devoted to pasture where drouth prevails is a questionable crop and it is difficult indeed to make such land earn dividends that would warrant a hundred or a hundred and fifty dollars an acre investment.

Many farmers who have kept a small herd of cows have figured they did not keep enough to warrant the building and filling of a silo. This is often a mistake for with the small herd the overhead cost of care and management is often higher than it is with a large herd and the need for economy is still greater. As silos become more numerous it becomes easier to fill them for the community is largely engaged in the work during the month of September and by exchanging work it is easy to arrange for the filling of the small silo which would only require one day.

For several years hay has not only been scarce but very high priced. It is exceedingly difficult to buy high priced hay and feed with a profit for either milk or beef production. A more liberal use of silage will do away with this high cost of hay and the succulent ration will give better returns. Along with the silo should be used leguminous hays or fodders. It has often been said, and truthfully, if you have silage then you also need alfalfa or clover and the soil needs it too. It has proven a wise and economic policy to combine these two great feeds in order to raise stock cheaply and will.

The silo has been making steady advancement for the past 25 years but without doubt 1919 will see more silos constructed on the American stock farm than ever before. Practically every state in the Union has found that the silo is well fitted to their conditions. With the silo they can feed economically and utilize all the forage they grow and so it is in keeping with economic production and with advanced and scientific farming that the silo has an important part in this readjustment period.

Wonderful Record by a Canadian Holstein

Rolo Mercena DeKol 30313 (C. H. B.), a Canadian five year old Holstein-Friesian cow has broken the world's record for seven and 30 day butter production by producing under official test 51.93 pounds butter in seven days

5 Champion Blood Champion Prospects 5

Do you want a good herd boar? Do you want to win at the fall shows? I have five yearling boars sired by the phenomenal Hampshire boar Director—sire of Director Jr., grand champion as junior pig at state fair 19[illegible]. Two are full brothers, three half brothers. They have been pronounced as good as the winner.

and 200.34 pounds butter in 30 days; her milk yield being 738.7 pounds and 2920.5 pounds for the respective periods. "Rolo's best day's butter amounted to 8.57 pounds. In 60 days she yielded 5795 pounds milk which made 337.49 pounds butter and her best work was accomplished toward the end of her test. The records were made under the supervision of Professor H. H. Dean, of the Ontario Agricultural College, and a retest was made by officials of the Holstein-Friesian Association of Canada.

Rolo Mercena DeKol is owned and was developed by J. B. Hanmer, a young Holstein dairyman of Ontario. Mr. Hanmer purchased her for $320 from his father, H. C. Hanmer, who has been breeding Holsteins for about six years. The present owner of this wonderful cow has only been in business on his own account for a little over a year. The sire of the new world's champion is Sir Rolo Banks Mercena 14953, a bull that has only two pure bred daughters. Her dam is Flora DeKol Pietertje 9163, with six daughters having official records. Both sire and dam trace back to Abbekerk Prince 2d 1068 in the Canadian herd book.

Record California Prices Secured by Morris

The honor of selling the highest priced bull of any breed, bred, developed and owned by California breeders, goes to A. W. Morris and Sons, Woodland, who sold the Holstein bull, Sir Aaggie Mead De Kol, in the Moyer National Sale at Philadelphia last week for $11,000. The purchasers were John Arfman and Carl Amos of Syracuse, New York.

Eleven Thousand Dollars
Sir Aaggie Mead De Kol, bred, developed and sold by A. W. Morris & Sons, Woodland, in the National Sale, Philadelphia, for $11,000.

Sir Aaggie Mead De Kol was sired by Sire Aaggie De Kol Acme, a son of Aaggie Acme of Riverside 2d, the cow that holds the world's strictly official record for butter production, having to her credit 1331 pounds butter. His dam is Aralia De Kol Pontiac Mead, with a two-year-old record of 932.4 pounds butter. His maternal grand dam is Aralia De Kol Mead with a strictly official record of 1215 pounds butter and she is a daughter of Aralia De Kol, a former world's record cow with 28,000 pounds milk and 1142 pounds butter to her credit.

The seven nearest dams of Sir Aaggie Mead De Kol have an average butter production of 1100 pounds, thus making him the only bull in the world backed by as heavy yearly production

Morris and Sons have developed one of the outstanding herds of the breed and have developed more high producing, long distance cows than any other breeding establishment. In addition to the above bull they consigned to the National Sale four head of females, but at the time this was written, no report of their sale had reached us.

Later by Wire.

Now comes wire with:

"Tilly Alcartra Second, consigned by Morris to National Sale, sold for $11,200. Two granddaughters of Tilly Alcartra sold, one for $2150, the other for $1654, or an average of $6500 for the four."

Regarding Tilly Alcartra Second, she is a two-year-old daughter of Segis Pontiac De Kol Burke and the famous Tilly Alcartra, the only 33,000 pound cow in the world and champion over all ages and all breeds. Her two nearest dams average 31,000 pounds milk in a year. Tilly Alcartra Second is a full sister to King Morco Alcartra, a sire that the Messrs. Morris are retaining in their own herd.

Bridgfords Develop New Record Cow

Nattalene Walker, a junior three-year-old registered Holstein heifer owned by Bridgford Company, Knightsen, recently completed an official record of 34.45 pounds butter from 818.5 pounds milk in seven days, and in 30 days made 134.76 pounds butter from 3319.9 pounds milk. Her 30 day records for both milk and butter are California records in class. She is a daughter of King Walker Fifth and out of a granddaughter of King of the Pontiacs. This heifer bids fair to reach still higher points of production as she matures if indications of production at her first two freshenings may be taken as an index.

Spring Farm Pauline Pontiac Second, a daughter of Spring Farm King Pontiac, also owned by Bridgford Company, recently made an official record of 33.03 pounds butter from 673.6 pounds milk in seven days.

The daughters of the Bridgford senior herd sire King Segis Alcartra Abbekerk are showing wonderfully well in official test work as they freshen. The first one to freshen calved to an accidental service at the young age of 17 months, but was put on test and made 16 pounds butter in seven days milking over 40 pounds per day. This heifer has just recently made over 15 pounds butter in seven days eight months after calving, showing a wonderful persistency in production. Luzette Segis Alcartra Abbekerk, by the same sire, calving at two years three months has made 22.09 pounds butter from 409.7 pounds milk in seven days. The latest daughter of this sire to freshen calved at two years one month, and has made 24.87 pounds butter from 483.3 pounds milk in seven days and 99.74 pounds butter from 2079.24 pounds milk in 30 days.

Nattalene Walker
At three years four months: Butter seven days, 34.31, milk 818.2; butter 30 days, 134.76, milk 3319.9. Owned by Bridgford Company, Knightsen.

To Catalog a Real Herd Bull

As an indication of the progress made by Shorthorn breeders in California, comes the announcement that W. M. Carruthers plans to make the premier attraction for his forthcoming sale to be held at the state fair grounds, Sacramento, July 10, the sale of his well known herd bull, Hallwood Villager.

Hallwood Villager, judged from any standpoint, is one of the most valuable bulls owned in the West and certainly one of the most valuable bulls ever offered at public sale west of the Rockies, and if there was not an existing demand for bulls of such quality it is quite certain that his owner could not have been persuaded to permit the public to appraise him in an auction.

Hallwood Villager was bred by the late E. M. Hall of Carthage, Missouri, a fact that should mean much to anyone at all familiar with the excellence of that herd at the time of the owner's tragic death. He was sired by Village Flash, counted one of the best sons of Villager and he is out of a Lavender dam sired by the Forbes bull,

Star's Champion, a son of Star of the North.

His individual excellence is indicated by the fact that he was first prize two-year-old at the 1918 California State Fair, and that he gave his stall mate, the three-times grand champion, Count Glory, the closest sort of shave for senior and championship honors. At that he had many friends around the ringside who regarded him as eligible for top honors.

One of Finest of the West

Hallwood Villager, premier attraction in W. M. Carruthers' sale of Shorthorns to be held at Sacramento, July 10.

As a sire his ability is clearly demonstrated by the quality of calves he has been siring—a number of which will be included in the sale—deep, thick-fleshed calves of the most desirable type. His individuality and breeding record is such that he can be seriously considered by any breeder and it is conceded that he will add strength to any herd.

Besides the above bull, Carruthers is cataloging a rare lot of females of desirable ages and representing choice Scotch breeding.

Live Stock Progress at Santa Anita Rancho

By C. L. Hughes

The splendid herds of registered live stock established by Anita M. Baldwin on her great Santa Anita Rancho, Santa Anita, are making most substantial progress and steady sales of breeding stock have kept the surplus moving into the herds of other breeders and live stock farmers.

Superintendent W. H. Taylor has accomplished wonders with the big ranch and has made a particularly notable success with alfalfa, corn, and other crops suitable for animal food, and has been equally successful in securing a high percentage of increase in the animals to consume this feed and walk it off the ranch to the market.

Earl Sturgis is back from the navy and has the big herd of registered Holsteins hitting a new stride, and there will be production records in plenty made in the herd from now on, not only in the short time divisions but in long time divisions as well, for it will be the policy hereafter to continue all the females on 305 and 365 day test. Of course the outstanding recent record was that of 36.21 pounds butter in seven days made by Alba Sadie Cornucopia Creetia, dam of the Santa Anita herd sire Prince Walker Cornucopia. This young sire is the highest record son of Prince Gelsche Walker, and is developing into an individual of the highest merit. He already has a promising start as a sire, some of his first calves having already been dropped, and more than 60 high class cows and heifers are now in calf to him, while he is still only just past two years old. A great deal may be expected of this sire, not the least interesting of which will be the performance of his daughters out of his half sisters, for he is being bred to all of the 24 daughters of Prince Gelsche Walker in the herd.

In the swine department business has been exceedingly brisk. It has been found in this herd, as in many others, that it pays to concentrate effort on one breed, and in future registered Poland-Chinas will be bred exclusively. Over 1000 purebred individuals of this breed are now in the herd and yet the herd has been hard pressed to fill its orders for sows and bred gilts. It will be remembered that Mrs. Baldwin purchased the great young Poland-China boar Banker's Boy, after he had won junior championship at the Panama-Pacific Exposition, for $1000 from M. Bassett, Hanford. The writer has always been interested in the career of this young sire, as he was placed in the Santa Anita herd and given the heaviest sort of service from the time of his purchase up to the present. Now that he has had an opportunity to demonstrate his worth as a sire, some of the results of his service were requested of Superintendent Taylor, who replied: "Banker's Boy has proved to be one of the greatest sires I have ever seen. We have sold over $15,000 worth of his get from this herd, and our present ownership of his sons and daughters runs into many thousands of dollars in value, and the boar himself is still doing active and heavy service. At $1000 he has proven one of the best investments we ever made in a breeding animal." The junior herd sire is Anoakia Chief, son of I. B. A. Wonder, and he is being used extensively on the daughters of Banker's Boy.

Additional buildings of high-class concrete construction are being provided at Santa Anita Rancho for the expansion of the Holstein and Poland-China herds. The popular blood lines and superior individuality of both herds have found high favor among buyers, while the policy of absolutely standing behind every animal sold has appealed strongly to the large number of breeders, dairymen, and hog raisers who look to this big ranch for high class breeding stock.

Berkshires Average $44.45 at Santa Rosa

The third Berkshire promotion sale under the auspices of the Western Berkshire Congress was held at Santa Rosa, Saturday, June 7, and was made doubly attractive by two special features inaugurated by J. Francis O'Connor, the local breeder. The first was a ladies judging contest, and won by Mrs. Throckmorton, Sebastapol. The prize was a young sow pig.

The second special event was a pig donated to the chamber of commerce which was raffled off and added $50 to the publicity fund of that organization.

As it is not the intention of the promoters of these sales to make high averages, and as the greater part of the offering was of spring pigs, the average of $44.45 obtained was in every way satisfactory.

The only bred gilt in the sale was consigned by the University Farm, Davis, bred to their good son of Grand Leader 2nd. Grand Fashion Leader. She topped the sale at $160.

The next highest priced animal was a son of Star Leader, consigned by Wm. T. Chapple of Fair Oaks Ranch, Willits, which brought $130.

Both of these were purchased by Mr. Slater of the Conoway Ranch, Woodland.

The buyers were: Dr. E. S. Bogle, Santa Rosa; L. E. Roof, Santa Rosa; W. P. Shearer, Healdsburg; Chas. L. Hampton, Santa Rosa; Conoway Ranch, Woodland; Fred J. Stewart, Martinez; B. C. Pressley, Santa Rosa; Glendon Whiting, Ukiah; Mrs. Winslow Anderson, Kenwood; Geo. A. Murphy, Perkins; Willis E. Farnsworth, Eldridge; A. B. Humphrey, Escalon; Joe Mannix, Santa Rosa; W. F. Sandercock, San Francisco; J. D. Krause, Santa Rosa; Wm. T. Chapple, Willits; J. M. Jamison, Santa Rosa.

The animals consigned to the sale were from the herds of J. Francis O'Connor, Santa Rosa; University Farm, Davis; J. Montoya, Hilton; H. C. Muddox and Son, Sacramento; E. A. Whiting, Ukiah; Wm. T. Chapple, Willits; Sandercock Land Company, Sacramento; A. B. Humphrey, Escalon; Geo. A. Murphy, Perkins; Geo. P. Upham, Martinez; Frank B. Anderson, Sacramento.

In addition to the above consignors, a few pigs were sold for the pig club boys and were purchased mostly by the breeders to give encouragement to the boys. Ord L. Leachman of Sacramento was the auctioneer.

The next sale will be held at Salinas June 28 during the Rodeo week.

LIVE STOCK NEWS NOTES

(Continued from Page 817.)

is Sandercock's intention to exhibit this sow at the fall fairs and it is probable that she will be fitted at Carruthers Farms.

Sandercock has assembled one of the best collections of Berkshires in the West and has at the head of his herd Baron Duke 101st., senior and grand champion at the 1917 National Swine Show. Among the sows in the herd are some noted winners and producers.

Tulare's First Annual Stock Show.

During the week of October 6 to 11 the Tulare County Live Stock Association, cooperating with the Tulare board of trade will hold its first annual live stock show in this city. Property has been purchased and fenced and sheds for the accommodation of 150 head of hogs and 120 cattle already have been built, and a number of other buildings for the housing of exhibits and for the comfort of visitors have been planned. The prize lists will cover all classes of cattle, hogs, horses, mules and poultry, and because there are more pure bred dairy stock in the Tulare district at this time than anywhere in the state, special emphasis in the displays will be made on live stock. Every effort will be made to make the affair one of statewide interest to stockmen, and many thousands of dollars have been pledged by local business men in support of the movement. A big Fourth of July celebration, similar to one last year when $6500 was raised for the Red Cross, will be held to add to the prize money to be offered.

First Government Report on Wool Prices.

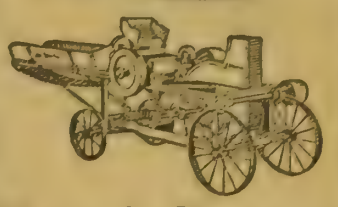
The first government wool market report has been issued by the bureau of markets, United States department of agriculture. It covers quotations on bright domestic fleece wool in all grades, also territory, California and Texas wools. Prices, based on actual sales in Philadelphia and Boston, are quoted on grease wool, showing the range and estimated shrinkage.

Special cables to the bureau of markets state that the second series of government colonial wool auctions at London shows a rise of five per cent for finer grades compared with closing value at April sales. Medium descriptions were unchanged, while coarser wools ruled slightly lower.

The detailed wool market price report and succeeding monthly or semi-monthly issues will be sent to any one interested upon application to bureau of markets, department of agriculture, Washington, D. C.

Hartsook Heifer Makes Good Showing

Dr. E. J. Weldon, secretary of the Jane Garden Farms, Sacramento, has received word that a junior three-year old daughter of the Jane Garden Farm herd bull, Prince Gelsche Walker Korndyke, owned by Fred Hartsook, Lankershim, has just completed a seven-day record of 31.8 pounds butter.



Last year, as a two-year-old, this heifer made a highly creditable record, but owing to the inability to get testers at the time the record could not stand as official.

Miller Bull to Pacheco Company.

T. T. Miller, Hollister, has recently sold the senior yearling Shorthorn bull Dalmeny Count to the Pacheco Cattle Company of Hollister.

Dalmeny Count was sired by Count Glory, the famous herd bull of W. M. Carruthers. His dam is White Briar, the dam of Miller's winning heifer, White Mayflower.

Put New Life In Your Engine

A dose of Johnson's Carbon Remover, the engine laxative, will cure 80% of engine troubles. It will increase the power of your car—improve acceleration—stop that knock—quiet your motor—save your batteries—cut down repair bills—and reduce your gas and oil consumption.

Don't wait until your motor is choked with carbon—remove it every week or two with Johnson's Carbon Remover. You can do it yourself in five minutes—no mechanical experience required. You will save from $3.00 to $5.00 over any other method of carbon removal without laying up your car and with very much better results.

JOHNSON'S CARBON REMOVER

is an absolutely harmless liquid to be poured or squirted into the cylinders. It contains no acids and does not affect lubrication or interfere with the oil in the crank case. Recommended by many of the leading car manufacturers including the Packard and Studebaker Companies.

For Tractors—Gas Engines

Johnson's Carbon Remover will also remove carbon from the motor of your tractor, giving it greater power and enabling it to work more satisfactorily and economically. It will make your tractor 100% efficient.

Johnson's Carbon Remover is for sale by Hardware, Accessory dealers and Garages. Send for our booklet on Keeping Cars Young—it's free.

Sparks from the University Anvil

By Jean A. Koethen

THE annual institute of poultry husbandry held by Professor Dougherty and his assistants in the south is always more or less of an event, not only to poultrymen but also to the many men and women who keep a few hens and like to do it scientifically. This year, perhaps because it was held at San Gabriel, a little nearer Los Angeles than other institutes have been held, also perhaps because it had the San Gabriel Valley Poultry Association back of it and the farm bureau boosting it, it was more of an event than usual. So much of an event, in fact, with its 260 registrants and still larger average attendance, that the U. C. summer poultry school may now be considered an established fact, and something as certain to occur as Thanksgiving or Christmas.

The San Gabriel Valley Poultry Association is certainly a bunch of hustlers. They modestly claim but second place among Southern California poultry organizations, but those who accepted their hospitality last week find it hard to believe than any organization can be more prosperous or more enterprising. The long line of automobiles which drew up before the Mission playhouse daily to take the crowd out for demonstration or ranch inspection was sufficient proof of the first. As for the second, one had only to see their ranches.

Professor Dougherty always has something new to offer in his annual lecture course. This year "Don't kill the two-year-old hen" was one of his slogans. "Hatch early but feed to prevent fall molting" was another. "Green range is better than confinement, but no yard at all is better than a bare one." was a third, though he did not put it in just that way. His lecture, "Breeding to increase egg production," while it contained much that was already familiar, probably commanded closer attention than any other.

Breed for Vigor.

In his earlier lecture on feeding Professor Dougherty had declared that the importance of feeding is greatly overemphasized, for: "Investigation indicates that feeding can do nothing but furnish material for maintenance and production. It cannot be made to take the place of breeding or of bodily vigor." The first requisite to egg production is a machine of proper capacity, and this means first of all constitutional vigor, not merely health but the ability to resist disease and changes of weather and environment.

"The most important problem poultrymen have to face is to positively eliminate the low producer and to build up the high producer, and this is a problem not of feeding but of selection." The hens selected as breeders should be of unquestioned constitutional vigor; they should be of good size and well matured, not pullets, for a pullet cannot lay eggs with strong germs before she is fourteen months old; they should be the late molters, hens that are pale in shank and vent and beak and ragged and faded in feather in September; they should have good heads and combs that are rather large for the breed and of fine, silky texture.

Since fecundity is inherited from a high producer by her sons rather than her daughters, the male selected to head the pen should be positively known as the son of a high producer. Like the hen he should be of the vigorous, blocky type, with short neck, long back and deep chest. Such a male, mated to two or three year old hens that have proved their value as producers not only by the number of eggs they laid in their pullet year, but also by profitable production for two or more years, and the eggs of each hen marked so that when the chicks hatch their percentage on both sides may be absolutely known, gives a foundation for the breeding of high producing stock.

Tobacco in the Mash.

For some years Dr. Beach and the medical staff at Berkeley have advocated the use of a wet mash moistened with tobacco tea to cure round worms. Now they have gone a step farther and discovered that tobacco dust in the dry mash has the same effect and is much more easily used. One pound of tobacco to fifty pounds of mash, Dr. Beach announced, is the proper proportion. They have also found, by experimenting with the different flocks, some of which were fed tobacco in the mash while some received none, that tobacco has apparently no harmful effect on either chicks or hens. The object of this experiment is to find out whether or not the feeding of tobacco will prevent infestation by worms, but, as so far neither the flocks that received tobacco as part of their ration nor those that did not have developed worms, no conclusion has been reached.

One can hardly help wondering what effect it might have on the tobacco industry if the feeding of tobacco to hens were to become general and what effect on the poultry industry if feeding tobacco in the mash were made to take the place of the absolute cleanliness and sanitation which have hitherto been considered the very foundation of successful poultry keeping. Infestation by round worms is the normal result of keeping hens too long on soil that has not been purified by a green crop. If doping can be made to take the place of elbow grease to what lengths may we not go?

Vaccination for Chicken-Pox.

To what extent vaccination is now is shown by Dr. Beach's statement employed for controlling chicken-pox that within the past six months 160,000 doses of vaccine have been sent out to California poultrymen. If vaccination always produced permanent immunity its importance would be tremendous, but the fact is that immunity in many cases lasts but a few months, and rarely if ever does it last more than two or three years. Hence chicken-pox may occur in the spring in a flock where the birds were vaccinated in the fall. On this account the University does not advise vaccinating until the disease has appeared in the flock. Even then the vaccination of only the birds in the pen where it has appeared is often sufficient. In small flocks or isolated cases, where treatment is more advisable or less expensive than vaccination, the most satisfactory treatment

POULTRYMAN'S CALENDAR—JUNE, THE MONTH FOR VIGILANCE

Well begun may be half done, but it is no more. June is the time to keep vigilant watch for the enemies which lie in wait to devour growing stock and nullify all your efforts.

Coccidiosis is one of these enemies. Chicks that have been improperly fed may develop coccidiosis at three or four months of age. Buttermilk or clabbered sour milk is the only cure. When chicks begin to droop, cut down the mash and grain and keep sour milk before them.

Mites are another. June is their best breeding month. Keep the coops painted with cresol or carbolineum whether you see mites or not. When you do see them the mischief will probably be done.

Lice are another. Chicks have a hard enough time if they are not tickled and worried by crawling creatures. Dust them often.

Lack of green feed is another. Don't skimp the greens. Let the chicks get their own on range if possible. If this is impossible keep the fresh-cut alfalfa, kale, chard or barley before them.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

is to remove the scab and paint the sore with tincture of iodine.

Tuberculosis, we are sorry to learn from Dr. Beach, is on the increase. It may be detected by the tuberculin test, which is merely the injection of a small quantity of tuberculin into the wattles. If tuberculosis is present there will be an immediate swelling of the wattles. A demonstration of both vaccination and the tuberculin test was given by Dr. Beach.

Lunch was served each day under the grapevine by a caterer from Alhambra. On Thursday, the last day of the institute, all comers were guests of the San Gabriel Valley Association, a gracious hospitality which was highly appreciated.

A. A. Peters, western representative of the department of agriculture, made a short address at one of the sessions in which he stated that thanks to the efficient organization of California poultrymen they are now receiving from ten to fifteen cents per dozen more for the eggs than poultrymen of other Western states who are not organized. E. E. Gordon, of the Los Angeles County farm bureau, brought the greetings of Dr. Coit, who was detained by illness, and declared that California poultrymen lead all the rest. Prof. W. E. Lloyd gave two lectures.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 30, 1919. Report for thirtieth week ending May 29. The hens in the laying contest at Storrs have yielded a little ground, but they are retiring in splendid order. Not only this, but they seem to have sufficient reserve so that it now looks as if the final outcome of the competition would be better than was first predicted. The total number of eggs for the thirtieth week was 4502 or a yield of over 64 per cent. This is 130 eggs better than for the corresponding week last year, and 175 eggs better than the five-year average for the thirtieth week. In this period of prosperity the Leghorns are larger participants than the heavy breeds, that is to say they are laying more than their pro rata share of the eggs. The Leghorns constitute exactly one-half the number of birds entered in the contest, and last week they laid nearly 55 per cent of the eggs.

Of the six best pens for the week all but one were White Leghorns. P. G. Platt's birds from Wallingford, Pennsylvania, were in first place with a yield of 61 eggs. The pullets entered by Rapp's Leghorn Farm, Atlantic Highlands, New Jersey, were a close second for the week with a production of 60 eggs.

With the advent of summer weather all poultry flocks are likely to fall off a little in their production, and unfortunately this cannot be entirely obviated. There are, however, helpful hints, some of which are so simple that when made the uninitiated consider them of only small importance. For example, it is just as necessary that hens have clean fresh water as feed, and yet this part of the ration is not infrequently overlooked or neglected, because it does not cost as much as a bag of grain. Add to this a bountiful supply of tender tempting green food, and then make a careful periodical examination for lice and mites and exterminate them, and in most cases the poultryman will be rewarded with more eggs.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks.

Jules F. Francais, 1153; Laurel Poultry Farm, 1089; Ingleside Farm, 963.

White Wyandottes.

Curtis L. Allen, 1098; W. Bradley, 1012; Patrick F. Sullivan, 946.

Rhode Island Reds.

Laurel Hill Farm, 1138; Deer Brook Poultry Farm, 1015; Chas. H. Lane, 968.

White Leghorns.

A. P. Robinson, 1030; Hilltop Poultry Yards, 994; Hilltop Poultry Yards, 994.

Miscellaneous.

Pequot Poultry Farm (R. I. Whites), 962; Chickatawbut Farms (White Rocks), 930; H. A. Wilson (White Rocks), 816.

AMERICAN EGG LAYING CONTEST

At the end of the first six months of the contest at Leavenworth, Kansas, (April 30), a pen of S. C. White Leghorns was in the lead with a record of 603 eggs. Second place was held by a pen of Barred Rock pullets, which produced 541 eggs.

The highest average production was made by the ninety-five White Leghorn pullets in the contest, with an average of 98.9 eggs. Such an average for six months indicates that they will average around 180 eggs by the end of the year.

The variety holding second place for high average performance was the White Orpington, with an average of eigthy-nine and one-half eggs per pullet. A White Orpington, a Silver Wyandotte and two White Leghorns each passed the 130 egg mark, the Orpington leading with 138 eggs. One pen of five Barred Rock pullets laid 121 eggs during the month of April.

REMOVE MALES FROM FLOCKS

Produce infertile eggs. They are worth more, as they keep better and they cost less to produce since there are no roosters to feed. No expense, education, ability, or labor other than catching and killing or selling the roosters are necessary. Remove the males at once.

While eggs are plentiful some should be preserved for the winter months, as they will be scarce and high priced. It costs but little in time, money, and labor, and is so easily done that it is only common sense to do it. Use fresh, infertile eggs and let customers know that they can get such eggs for preserving.

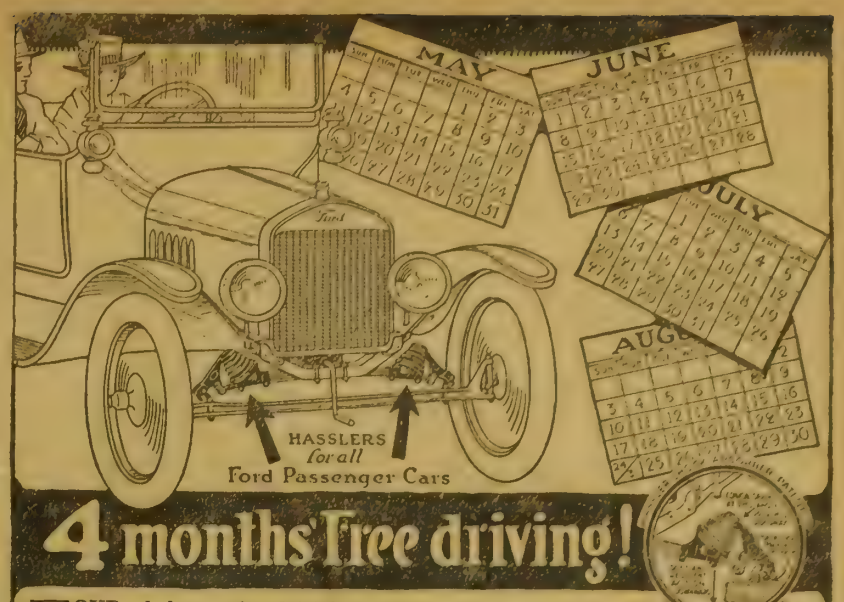
Now is the time to begin culling flocks. Send the roosters to the chopping block or the market. Eliminate all weaklings and deformed chicks. Get rid of the chick that stands along the side of the coop with its wings down, its feathers ruffled, eye shut, and head down. Do not keep a single chick that you are not sure it will pay to raise.

Shade, clean, fresh water, clean coops, and colony houses, and good ventilation and plenty of room during the night are of the greatest importance in growing healthy, strong, vigorous birds, whether they are for meat, eggs, or breeding.

Growing chicks should have plenty of good, nourishing food. Bone meal should be fed liberally to those intended for layers or breeders.

Do not forget to continue the fight on mites and lice. They must be fought all the time in all sections and in all seasons.

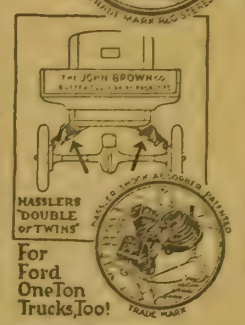
SELL, PEN OR COOK THE ROOSTERS



As soon as the last eggs are set the usefulness of the roosters has ceased and they should be disposed of. On most farms the best plan is to sell all roosters as soon as the breeding season has passed. If it is desired to save especially valuable males for next year's breeding they should be separated from the hens and kept enclosed throughout the summer. Several roosters may be put in the same pen without serious trouble. Unless the rooster is unusually good he should not be saved, as cockerels give better fertility and better breeding service than old males, and the feed bill for keeping the old birds will go a long way toward buying a vigorous cockerel this fall.

Straw and similar material gathers moisture, and when the litter becomes damp enough to be limp it is practically useless for fowls to scratch in for their grain feed. Scratching litter in the poultry house is essential, but it should be cleaned out and renewed frequently.

The poultry building should not be so wide that the rays of the sun can not reach the back of the interior of the house. Otherwise it will be damp. Fourteen feet is a convenient width.



There are many advantages to a single-pitch roof on the poultry house. This type is most easily built. It gives the highest vertical front exposed to the sun's rays and throws all of the rain water to the rear.

The simplest way to prevent the accumulation of dirt is to make it easier to be clean than to be dirty.

4 months Free driving!

FOUR whole months of driving at no expense to you for repairs or tires. Four whole months in which there will be no depreciation in your car. This is exactly what will happen when you equip your Ford Car or Ford One Ton Truck with Hassler Shock Absorbers. They mean a saving of at least 80%—in all of these costs—the equivalent of four months of driving. Hasslers accomplish these things so easily because they protect the vital parts of the machine from road shocks and vibrations. It doesn't seem like the same car—and you'll say that Hassler Shock Absorbers far more than pay for themselves in improving the riding qualities. They will convert your Ford into an easy-riding, comfortable car for any purpose—more satisfactory—more economical—a machine that will last two or three years longer. You can satisfy yourself regarding the value of Hasslers without risking a penny.

For Sale—Imperial Valley's finest fruit and alfalfa farm for sale at a bargain, 160 acres. Earliest grapes and apricots in the United States. C. A. Myers, 1119 Haas Building, Los Angeles.

For Sale—34 acres improved and irrigated land, ¼ mile from Newman, Stanislaus County, $260 per acre. Owner, W. L. Bone, Escalon, California.

CATTLE

Guernseys—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., California.

BUTTE CITY RANCH
SHORTHORN CATTLE, SHROPSHIRE SHEEP, BERKSHIRE HOGS, SHETLAND PONIES. Stock for sale at all times. Second Farm Sale—all breeds—August 2, 1919. W. P. Dwyer and W. S. Guilford, Box C, Butte City, Glenn County, California.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show Herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California

For Sale—35 Head high grade Holstein cows fresh and close springers. Come and see a real bunch of cows. Cows displayed one-half mile west of Burbank on Shriner Ranch. Hannon Bros., Third Street, Lankershim. Care of Chas. Irwin.

Elkhorn Farm Ayrshires — Choice registered young bulls at reasonable prices. J. H. Meyer, 440 Montgomery Street, San Francisco, California.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Sunshine Farm Jerseys—Tuberculin tested. "Production counts." E. E. Greencugh, Merced, California.

Registered Holstein Bulls of various ages for sale Millbrae Dairy, Millbrae, California.

Jersey Bulls—Type and production, easy terms. N. H. Locke Co., Lockeford, California.

CATTLE

Ayrshires (registered) — A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Arizona.

Breeders of Registered Shorthorns—Milk Strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Shorthorns — A few choice young bulls, grandsons of Fair Knight. Prices reasonable. Fair Oaks Ranch, Willits, California.

MULES

For Sale — Twenty-five young mules, one and two years old. Chas. Hubbard, Riverdale, California.

QUESTIONS AND ANSWERS

(Continued from Page 813.)

five years old. A couple of months ago its right ear began to discharge. This discharge formed a flaky crust on the inside of the ear. I cleaned it with a solution of bichloride 1-2000 and dusted the ear with a healing powder used for dusting gall sores, etc., for the horses. The ear seemed to be better, but a few weeks after I again noticed the crust forming and cleaned it as before. Now this morning I again cleaned the ear and found the left ear has begun to discharge. How should this be treated? Would it be best to kill the buck? Is this discharge contagious? How old can a buck be and still give good service? We have three does. We have hutches with wire floors raised from the ground and kept clean. So far have seen no trace of the disease in the does or young ones.—Subscriber, Alta Loma.

To the writer the trouble appears to be ear canker. Take an ounce of olive oil and as much flowers of sulphur as will lay on a dime. Mix well. Take animal firmly by ears and nape of neck, turn up ear and drop two or three drops in ear. Let animal clean out ear. Have hutch clean, disinfect, etc., put some straw in so feet will be clean. Give second dose in three to five days if necessary. Bucks three years old are still good for service. After that procure younger one.—W. D. W.

Formula for Dry Mash

Please give me formula for mixing dry mash for growing chickens?—Subscriber, Lakeside.

The mash recommended by our own experiment station consists of two pounds bran, two pounds shorts, two pounds meat scrap, one pound barley meal, one pound ground bone, one-quarter pound charcoal. With this is used a scrap mixture consisting of two pounds each cracked wheat, cracked corn and steel cut oats.—J. A. K.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Can't Will Property

John Doe wishes to make an olographic will leaving all his property to his wife. A form of will for this purpose was printed in the Cultivator about 14 months ago, but it did not cover the following condition: John Doe will in due course of time inherit some property from his parents. He wishes to make his wife heiress to his inheritance if he should die before receiving it. How should the will be drawn, to provide for such a case?—R. G. D.

If the property vested at the time of the death of the husband, it will be conveyed to the wife under the provision of the said form of will. If the parents died without leaving will, after the death of the husband, in case he left no children, their property would go to their other heirs; in case they died leaving will wherein he was mentioned and had died prior to that time, no will which he could make could have any bearing upon the disposition of the property.

Must Fulfill Contract

I bought a place under an agreement whereby I am to pay so much cash each year and one-third of the crops. I put 20 acres in corn and rented 40 acres under an agreement that I was to have one-third of the crop. Do I have to yield this one-third to the vendor?—Subscriber, Willows.

The tenure under which you hold the place is that you yield one-third of the crops, and cannot by a lease which you make subject to the agreement under which you hold the place, deprive the vendor of his one-third; you would thereby be required to yield up to the vendor the one-third which you obtain under your lease as rent.

Property Rights of Second Wife

Husband and wife acquire considerable property, the wife dies, the husband remarries. In the event that the husband dies and leaves no will, what portion of the property could the second wife claim? In the event that he does make a will, could he deprive her of any interest in the estate?—Subscriber, Porterville.

In case there were no children by the first marriage the whole of the property owned by the husband at the time of the second marriage, and the increase of that property would be the separate property of the husband and would be absolutely subject to his disposition by will. In the event that he leaves no will, and there were no children by the first wife, the second wife would receive one-half of the estate. In the event that there were two or more children by the first wife, she would receive one-third.

Property Restrictions.

The restrictions upon certain property run out within six months. After that time can the owner of said lot build an apartment house, bungalow court or front buildings flush with the street? After the time when these restrictions cease can other owners of property get up a petition and have the restrictions extended? — Subscriber, Montalvo.

Restrictions upon property are merely reservation of an interest in the title which is retained by the owner at the time of deed. When such restrictions by their terms cease to operate, the whole title to the property thereupon devolves upon the owner of the land at that time, and he can therefore do as he pleases with the property thereafter. It is easy to be seen therefrom that no owners of other property could impose restrictions by any petition or action which they might take.

FERTILE EGGS SPOIL

Warmer weather is causing the rapid spoilage of fertilized eggs according to egg dealers. Poultry specialists join with them in recommending the production of infertile eggs, since the male has no influence whatever on the number of eggs produced. The development of the embryo begins at 68 degrees Fahrenheit. A temperature of 85 degrees for three or four days or a temperature of 100 degrees for 24 hours may cause sufficient development of the embryo to make the egg unfit for food. An infertile egg may be subjected to a temperature of 100 degrees for a week or ten days and still be perfectly good for cooking purposes. By keeping such eggs cool, they may be kept in good condition indefinitely.

KELLOGG'S ANT PASTE

THE COST OF COMPLAINING

'Taint in the way o' common sense
To growl at rain an' bring the sun,
A grumbler never built a fence
Or finished work that should be done.

I've never known the clouds to go
Becoz some feller sat an' whined,
When it's too wet to plow or hoe
Some other task to do I find.

I've never known a kicker yet
To alter things past his control,
Nor met a man with power to fret
An easier journey to his goal.

Fond hopes go wrong an' plans will stray
However much a man complains,
An' spite of all we have to say
When it is willed to rain, it rains.

The chap that gets the biggest crops
Is not the one that wears the frown.
When growlin' starts, all progress stops,
No man can climb by sittin' down.

Time spent in whimperin' is lost,
An' cursin' never changed the sky;
The grumbler pays a heavy cost
For every discontented sigh.

So when in mire my wagon's stuck
I do not idly stand about
An' start to rave an' curse my luck,
I go to work to dig it out.

An' when I've wanted weather fair,
But skies are gray instead o' blue,
I change my plans right then and there
An' find some other work to do.
—Edgar A. Guest.

STRIKE OF THE SAFETY PINS

By Alice Dyar Russell in Youth's Companion

The Button family and the Sa Pin family were enemies. Disp between the Buttons and the Sa Pins began on the very first day they were any little boys and with clothes that had to be faste When a Button skipped off to pla Safety Pin had to be called in to the Button's work; and since that quently happened, and since Sa Pins are a sharp touchy family way, their tempers soon become bearable. You would not have wa one of them round a minute if you known that they were just looking a chance to prick some one. But the Buttons did not care a bit; they shirked their work whenever they could and then made fun of the cross Safety Pins .

That brought about a dreadful state of affairs. In a certain household of six little children the Safety Pins had so much to do that they grew tired and bad-tempered. They refused to pin anything for anyone.

The mother of that family was very busy from morning till night. The baby needed a great deal of attention, meals had to be cooked for the five other children and for their father, and dishes had to be washed and rooms swept.

Sometimes she was so busy that she could not attend to the children as she wished to do. When one of the little boys ran in from play and cried, "O mother, a Button has come off my overalls!" she would merely turn from the stove and exclaim, "For pity's sake! Another Button off? Well, I can't leave the griddlecakes a minute! Here, take this Safety Pin!" And sometimes when one of the little girls started to put on a clean apron in the morning, and stopped and cried, "O mother, I can't fasten my apron! There's not a sign of a Button on it from top to toe! What shall o?" her mother would have to answer, "O dear me! More Buttons off? by won't let me put him down; 'll have to use a Safety Pin!"

When the Buttons heard remarks e that how they did laugh, and how y did yank themselves off, and how y did rub themselves on the washrd until they rattled! At last they uld all go tumbling and rolling ay to play games and have parties l picnics without a care in the rld to trouble them.

Of course, while the Buttons were ring such good times the Safety s had to work harder and harder; only the little ones that always k care of the baby, anyway, but the granndfather and grandmother s,. who naturally expected to be e to lead an easy life. The time ne when they had to work even at ht, holding fast the necks of the ldren's nighties.

Then it was that the whole Safety Pin family struck. They got together and declared that they would not do any more work. They would not hold up petticoats, they would not fasten sweaters, they would not even pin the baby's clothes. And in order that no one should compel them to work they all scurried away and hid. They slipped into cracks, they slid behind couches, and they wedged themselves under the cushions of chairs; they rcawled into places where nobody ever even thought of finding a Safety Pin.

The next morning there was a great to-do. The Buttons had all gone from the children's clothes some time ago; they were rolling round on the floor in a perfectly irresponsible way, or chattering together in boxes and bags and drawers. And now, all of a sudden, the Safety Pins were gone, too. Such fussing, such crying, such complaining began among the children! There they stood hanging on to skirts or to blouses, all talking at once to their poor mother, and all very unhappy. The baby was the only one who did not care. He merely caught hold of his foot and tried to put his big toe into his mouth.

"Oh, where have all the Safety Pins gone?" the children cried over and over. Then they began to hunt for them, although they could not search very well with their clothes coming off at every step.

They hunted and hunted. Once in a while a sharp eyed child would spy out the hiding place of one of those bad Pins, and there would be a powwow, with everyone talking at once.

"O mother, see what I've found! A Safety Pin, a Safety Pin! Right here under this rug! Just when I needed one so badly!

"Oh, let me have it!" one would begin.

"No, let me! I need it the most, you know!"

"No, I need it the most! Look at my clothes—they are all sliding off as fast as they can!"

The children made such a fuss over a single Safety Pin that he could not help feeling proud of himself and almost glad that he had been found. You can imagine how that mother felt after a whole day of such goings on. She decided that something had to be done, and that it had to be done at once.

That night, after the six children were tucked into bed,—each of them covered with an extra blanket because their nighties came open at the neck,—the mother sat down in front of her workbasket. In her lap she held a bowlful of Buttons. On a table beside her was a great pile of children's clothes—every skirt, every petticoat, every waist, every little garment, that she could find. There was not a single Button on any of them.

Then the mother took a needle with a big, wide-open eye and threaded it with stout waxed thread. She sewed each Button to a little round piece of very strong material, about the size of a nickel, and then she sewed Button and all on the children's clothes.

The way that needle traveled back and forth through each Button was enough to prove to anyone that it would be a long time before that Button got loose again.

The children were delighted when they found their clothes the next morning; they dressed so fast that they did not know themselves. The Buttons were sulky, but what could they do?

The Safety Pins grew tired after a while of staying in stuffy cracks. Now and then one of them would peep out. But for a while it was no use. Whenever a little boy, tightly buttoned into his shirt, or a little girl, perfectly sure that her petticoat was not coming off, happened to spy a Safety Pin peeping out somewhere, the only remark was:

"Pshaw, look at that old Safety Pin!"

But as time went on, the Safety Pins came out of their hiding places and went back to the nursery. Then, whenever a Button decided suddenly to go off for a holiday, a Safety Pin would almost jump into the place he had left.

Very few of the Buttons went off for holidays, it is true, for they, too, had learned their lesson. They stayed faithfully at their posts, and ever after there was good feeling between the Safety Pin family and the Button family.

CANNING TIME AGAIN

Canning time is here again and with the present high prices of fruit no scrap should be wasted. Cull and small fruits that never were canned or dried before will be saved this year for jams and jellies and fruit syrups. And rhubarb will be used as a carrier of the more expensive flavors contained in berries, currants and other fruits. The combining possibilities of rhubarb are endless. It has the acid that easily takes other flavors, and its pulp is quickly incorporated with and becomes part of mixtures—not that anybody needs to conceal the fact that rhubarb has been used, for it is good on its own account, but it does help to make the more expensive fruits "go farther."

To prepare the rhubarb, pull stalks, wash and clean while fresh—do not remove peel or skin, for the peel contains the color and most of the fine flavor. Cut in inch or less pieces, put in kettle with cold water and a little soda, let come slowly to boil, remove from fire, pour off soda water and use in any other fruit or jam. (If preparing the rhubarb to use by itself, simply add sugar and set over slow fire for a few minutes to let the sugar dissolve. Practically no further cooking is required.)

Get Supplies Now.

But as to canning in general. If you have not already secured new tops and rubbers for the old jars, and additional jars if necessary, now is the time. And now is the time to plan on using the fresh green fruits for jellies, especially the early berries; no others jelly so well.

Recipes for jelly and jam making we will give in these columns in later issues. For this week we give directions for canning fruit by the cold pack method.

The Home-made Canner.

Make false bottom to fit inside ordinary wash boiler. This may be of heavy wire screen, a wooden grating, or even straw.

He hasn't forgotten-

No need to tie a string 'round *his* finger to remind him of Ghirardelli's Ground Chocolate—for that's *one* good thing he never forgets.

Nothing more delicious or more nutritious! And nothing quite so handy! A hundred uses in every can—always keep a can on hand!

Ask for Ghirardelli's *by name*—and see that you get it. In ½ lb., 1 lb. and 3 lb. cans—wherever you do your trading.

Say "Gear-ar-delly"

Since 1852 D. GHIRARDELLI CO. San Francisco

Ghirardelli's Ground Chocolate

All jars, tops and utensils used in canning should be given thorough cleaning, washing in hot suds, using small scrub brush for tops, then rinse thoroughly.

Use fruit as soon as possible after it is picked. The fresher the fruit, the better the canned product will be and the less sugar it will require.

Wash fruit in small quantities, peel and pit quickly and pack directly into jars or cans.

If all the fruit is washed at one time and left to stand some of it will soften and some of it will ferment.

Fill cans with hot water or with syrup. (Jars should be warmed first to avoid cracking). The fruit will keep if no sugar is added, but is richer if the sugar is cooked with it rather than added later, though many prefer the "fresh" taste of the fruit canned without sugar.

The usual sugar syrup for apricots, peaches, plums and berries is made by dissolving 3½ pounds of sugar in a gallon of water. For apples, pears, quinces, prunes, and cherries 2¼ pounds of sugar to the gallon is sufficient. If neutral 65 degree grape syrup is used, from 5½ to 3½ pounds should be used per gallon of water.

Place the full cans or jars with loose covers on the false bottom in the wash boiler, adding water to about two-thirds their height. With cans boiling water is best; with jars it should be simply warm. A second tier may be placed on a wooden rack resting on top of the first tier.

Place the cover on the boiler and heat to boiling. The boiling should continue for 20 minutes for apricots, free-stone peaches, plums, berries, apples and cherries. For pears, cling-stone peaches, and unripe fruits, 30 minutes are necessary to cook the fruit.

The tops of the jars should be screwed down tight while still boiling hot and placed upside down or lying down on a table to cool. Wax-top cans should be removed quickly and sealed while still boiling hot.

CANNING AND DRYING NOW

The canning and drying season will soon be at its maximum. If containers have not been secured, order them at once. Make sure the tops and jars on hand are in good condition, and likewise get a plentiful supply of good rubbers. Can and dry a sufficient quantity of early fruits and vegetables for next winter's use, and also make the necessary plans for putting up berry and fruit juices by laying in plenty of bottles, caps, and other needed supplies.

HOUSEHOLD QUERIES

Kumquat Marmalade

Here is a good recipe for kumquat marmalade. I have tried it and found it splended, and am very glad to pass it on. I enjoy reading the Home Department in the Cultivator:

One quart kumquats, two lemons, sugar, water.

Quarter the kumquats and remove seeds. Slice lemons, rejecting seeds. Combine the fruits and let stand for 24 hours in twice their quantity of water. Place over a low heat in the same water and boil gently for one hour. Cool, add two cups of sugar to each pint of fruit and juice and boil gently till clear and thick. This amount will fill nine medium sized glasses.—Mrs. H. Fraser, Pasadena.

Kumquat Marmalade.

In response to your request (in issue of May 24) for kumquat recipes, I am enclosing one for marmalade which I use every year, and we all think is very good.

Wash and remove seeds. Slice very thin or put through the food chopper. (I do the latter, as it is quicker and just as good.)

Weigh, and add same weight in water. Set away until next day. Then boil until tender in same water. Set away again. The following day boil thirty minutes. Weigh again and add same weight of sugar. Boil twenty minutes. Put in glass cans or jelly glasses.—Mrs. H. W. Hall, Grand Bay, Alabama.

Soft Soap.

I saw in the issue of the Cultivator for May 24 an inquiry for a recipe for soft or home made soap. I have used that kind of soap for laundry purposes for years and will give you my method of making it.

In the first place when you wish to save ashes for soap be sure you burn nothing but oak or ash wood. Prepare a leach anyway you please, but I take a barrel and bore some holes across the bottom of it, then set it on an inclined platform, placing a piece of board on each side of the holes to make a channel for the lye to run through, then before filling the barrel with ashes, place two or three inches of clean straw in the bottom of the barrel, then put your ashes in, leaving a little place scooped out at the top in which to put water. The first lye that runs through will be very strong, but it becomes weaker the more it is drained off. I have a 15-gallon kettle in which I make soap and I pour the lye in this until it is about three-fourths full, then test it with a fresh egg, and if the egg shows more than a spot the size of a silver dime above the surface of the lye it is too strong and must be weakened by adding water; if the egg barely floats it is too weak and will require more boiling.

(Continued on Page 829.)

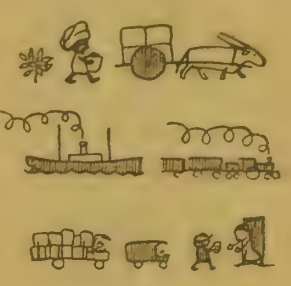
Such a Little Thing!

TEA is such a little thing that we never stop to think how intimate a part it plays in our daily lives and what a wholesome influence fine tea exerts upon our restful moments.

Would you like to get more enjoyment out of tea? And if that greater pleasure can actually be enjoyed for less money than you are now paying for tea, would you like to know about it? Isn't this worth a little thought?

When people think about tea, they forget that tea-leaves contain tannin as well as tea-flavor. *Tannin*, you know, is an acid found in all kinds of leaves and is used to tan leather. Tannin may be all right for leather, but not for the delicate tissues of the stomach. It injures digestion and is hard on the nerves. Besides, it isn't tea—that harsh puckery taste isn't tea.

People don't want tannin of course. They want tea-flavor which gives enjoyment, gentle stimulation, rest and cheer. That is the charm and value of tea—and the only thing worth buying.



Common tea, which comes from the older leaves of the tea-plant, has only a small amount of tea-flavor—and coarse flavor at that. The main strength of common tea is tannin.

Fine tea, which comes from the young tender leaves of the tea-plant, is rich in sap and fine tea-flavor. It has only a very small proportion of tannin, and even that is avoided by proper making at home.

Now the tea in the cup can't be any better than the tea on the bush. A coarse leaf makes poor tea; and all the money you pay to bring it over here doesn't make it a bit better.

The costs of getting tea from the tea-plant to your kitchen are heavy; there is picking, grading, firing, packing, sending over in ships, and a lot more—20 or 30 things to be done, and each one costs money. All together these costs are more than two-thirds of the price you pay for common tea.

You are now ready to understand something that we have not dared ask you to believe before—and that is:

Fine tea is actually cheaper than common tea. It is much stronger in real tea-flavor, and makes a great many more cups to the pound. The result is that a cup of fine tea, like Schilling Tea, costs less than tea selling at 15 to 20 cents less.

This is astonishing but true; and the thing that makes it true is the great cost of getting tea to you from the tea-plant. You have to pay this cost for common tea, with half tea-strength, just the same as you would pay it for fine tea with full tea-strength. In buying common tea, you pay these expenses twice over for the tea-strength you get. It isn't worth this high cost to bring over poor tea with so little tea-flavor.

So you see that after all, getting full tea-enjoyment is more a matter of knowledge and good judgment than it is a matter of money.

Schilling Tea is the fine economical practical tea of this country. It is rich in tea-flavor and costs only ⅓ of a cent per cup. It is the cheapest drink next to water.

Isn't it pleasant to know that the comfortable social pleasure of enjoying fine tea is open to everyone?

A Schilling & Co San Francisco

Los Angeles Markets

Los Angeles, June 11, 1919.

BUTTER

Butter, creamery extras, Produce Exchange price 57 lb.; prices to retail merchants in 1-lb. squares, 57@58.

Belgian hares, 15.

LIVE STOCK

Recent sales of beef steers in Los Angeles at $10.50 per cwt f. o. b. here are not altogether an accurate criterion of the market for good steers. These cattle were sold at that price because they had to be marketed at once. The market was full of good cattle and these sales had to be forced, hence the low figures.

The local market indicates signs of improvement for steers. California steers sold today in Kansas City are as follows: 275 steers, 1122 to 1163 pounds at $12.25; 25 steers, 1100 pounds at $11.50; one lot of steers still unsold; 1500 spring lambs from California sold in the same market for $17.75 to $18.00 with 250 culls out at $14.00 average 65 pounds; 250 ewes, 118 pounds at $9.45.

The local market for hogs is weak at a $1.00 decline under last week's prices. The supply is fully adequate. Lambs of good quality are very scarce and the market is strengthening daily. An advance of $2.00 per cwt. is recorded during the week just past. Ewes and wethers hold steady under a light demand.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Cattle:

Good steers	10.00@11.00
Medium steers	9.50@10.00
Common steers	8.00@9.00
Good cows	9.00@9.50
Medium cows	7.00@8.00
Common cows	5.00@6.50
Hogs No. 1, 175-225 lbs.	18.50@19.00
Hogs No. 2, all other weights	17.00@17.50

Sheep:

Lambs No. 1, 55 to 75 lbs.	15.00@16.00
Lambs No. 2, 65 to 80 lbs	12.50@13.00
Wethers	9.00@9.50
Ewes No. 1	8.00@9.00

GRAIN AND FEEDS

Barley, (1918 crop): Feed, 2.55@2.60 per cental; shipping, 2.65@2.70 f. o. b. Port Costa; new feed, 2.45@2.50.

Oats: Red feed, 2.25@2.40 per cental.

Corn: California yellow, 3.15@3.40 per cental. Egyptian, 2.75@3.25; Milo maize, 2.50@3.00.

Rye: 3.65@3.75.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of June 7, Scott, Magner & Miller says:

Receipts past two weeks 2582 tons. The market the past week has been slow and inactive with the possible exception of a few cars of fancy wheat and red oat hay which have sold to advantage and have brought our top quotations. Regarding the other grades of hay there is little demand and as dealers are rushing in the balance of their holdings of old crop in order to get it out of the way before the new crop comes along in quantities it is very hard to give a correct idea of present prices.

New volunteer hay is arriving more freely every day and several lots of grain hay have been baled and are about ready to move into this market. Within the next week no doubt both wheat and barley hay of the new crop will arrive. New volunteer hay has been selling at from 8.00 to 11.00 per ton in the country districts and new wheat and wheat and oat hay at from 12.00 to 14.00 per ton according to quality and freight rates.

The second cutting of alfalfa is being harvested at this time and we believe that within the next two weeks the scarcity of good alfalfa hay will be relieved. Considerable alfalfa hay has been purchased in the interior for grinding and as soon as cured will no doubt be used that way.

The alfalfa crop appears to be large, and should water for the irrigation districts continue plentiful no doubt there will be a very large crop of alfalfa harvested.

There is practically no demand for straw.

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	19.00@21.00
No. 1 Wheat or Wheat and Oat Hay	16.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	17.00@19.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	11.00@14.00
Barley Hay	11.00@14.00
Alfalfa Hay	15.00@19.00
Stock Hay	11.00@13.00
New first cutting Alfalfa, in order	10.00@13.00
No. 1 Barley straw, bale	50@80

Citrus Markets

Los Angeles, June 11, 1919.

Oranges, especially small sizes, of which there are large numbers in the Valencias, have suffered during the past week. Larger sizes and fine stock have been better received. Valencias have been going forward in large quantity and heavy supplies in some of the larger auctions have helped to weaken the situation somewhat.

Excessively hot weather has helped the lemons out, however, and every offering is quickly picked up with prices nearly doubling those of two or three weeks ago.

Shipments.

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 24,158 cars, lemons 6158, total 30,316. To same date last season; oranges 10,772, lemons 3349, total 14,121. Central California this season; oranges 4340, lemons 354, total 4,694. Last season to same date; oranges 2520, lemons 115, total 2635. Northern California; oranges 244, lemons 2; last year same date oranges 202.

Saves a Team on the Binder

Cushman Binder Engine

The Cushman 4 H. P. is the one Successful Binder Engine. Thousands are in use every harvest. **Fits any binder.** Engine drives sickle and all machinery. Since horses have only to pull machine, two horses will easily handle 8-ft. binder in heavy grain. In a wet harvest Cushman Engine **saves the crop,** as it keeps sickle going when bull wheel slips.

Very Important—The weight of the engine on the rear of the binder, only 167 lbs., is balanced by the simple cone water cooler on the front of the binder. This balancing, and the water cooling, to prevent overheating on all day runs, are necessary to successful work in a hot field.

After harvest Cushman engine does all other work. Very light weight and easy to move around, yet runs more steadily than most heavy engines, because of **Throttle Governor and perfect balance.** 4 H. P. weighs only 190 lbs.; when stripped for binder only 167 lbs. 3 H. P. only 320 lbs. Also 15 and 20 H. P. sizes.

The Sahara Drier

IF YOU grow Fruits or Vegetables our Drier is your Crop Insurance. Banks thrive and grow rich by a small margin of profits. Banks protect themselves against losses. The farmers persist in taking chances of losing their crops and entire year's work. The thrifty farmers are setting about this year to stop these losses and protect their years of labor and investment.

JUST A FEW of the Growers who know what they are doing—these men have just placed orders for "SAHARA DRIERS." Look them over—they are the leading farmers in their respective districts—they make few mistakes:

D. B. Gray, Fowler, Calif.—Raisins.
Chellini & Reith, Sonoma—Prunes.
Sanitary Fruit Co., Red Bluff.—Prunes.
D. D. Erwin, Chico.—Prunes.
Piru Land Co., Piru, Cal.—(5 Driers) Apricots.
Jos. Feige, Healdsburg.—Prunes, Apples.
H. B. Reed, Chico—(8 Driers) Prunes, Apricots.
Geo. W. Clemson, Owensmouth—(6 Driers).
Kelly Bros., Chico.—Prunes.
G. L. Barham, Chico.—(2 Driers) Prunes.
Anderson-Barngrover, San Jose—(2 Driers).
A. R. Friesen, Dallas, Ore.—Prunes.

There are many others. See our Representatives for catalogue and particulars.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Hollow Tail (Indigestion)

Would like to know what causes hollow tail? My neighbor has a cow affected with it now and again. She loses her cud and will not eat for several days. Is the milk good while she is affected and what is the remedy? —Subscriber.

There is nothing wrong with the tail. It is only indigestion and does not affect the milk. Get one ounce of aloin, one ounce of powdered Nux Vomica, four ounces of turpentine and two quarts of raw linseed oil. Mix and divide into six doses. Give one dose once a day while it lasts. Also give her a tablespoon of baking soda in the feed once a day for two weeks.

Dehorning Goat

We have a half Toggenburg and half Nubian goat five years old whose horns have been cut off once, leaving about seven or eight inches. Can these horns be cut off close to her head without injury? She was shipped to us from Pasadena and gave 1½ quarts to the milking. We have had her about two weeks and she hardly gives this in two milkings. How long before she ought to come back to her milk?—Subscriber, Lakeside.

Yes, the horns can be cut off close to the head, but the closer you cut them the more they will bleed. You can stop the blood by soaking a wad of cotton in tar and tying it on each horn. Leave it on about ten days. She will probably increase in her milk again if she gets plenty of green feed and is milked regularly.

WATCH FOR THESE TWO PLANT ENEMIES

Two plant enemies of a very serious nature have gotten into this country from Europe. They are the European corn borer and the European potato wart disease. At present both apparently are confined to a comparatively limited territory, but every precaution and the utmost care will be necessary to prevent their spread. Unless controlled they may become the most destructive enemies of two of America's greatest food crops. The corn borer now is known to exist only in Massachusetts and New York. It feeds on all parts of the corn plant and has an appetite for many garden and ornamental plants. Its presence is detected by broken tassels and with sawdust-like material at the breaks, and by holes in the stalk surrounded with the same sawdust-like material. The potato wart disease is now confined to a part of Pennsylvania. This disease is noticeable at harvest time, and is characterized by warty, spongy, cauliflower-like growths on the underground portions of the plant. Write to the United States Department of Agriculture, Washington, D. C., for information on these plant enemies, and watch for them in new places.

ESTIMATING PAINT REQUIREMENTS

In estimating the amount of paint required for the home, the property owner is sometimes at a loss as to just the number of gallons required. While the quantity of paint required varies somewhat with the nature of the surface to be covered and the conditions under which it is applied, yet the following method of measurement will serve as an accurate guide:

A good grade of prepared paint will cover at least 350 square feet to the gallon, two coats. First, measure the distance around the house and multiply by the average height; then divide by 350 and the result will be approximately the number of gallons to buy. Of this quantity one-fifth will represent the paint required for trimmings, cornices, etc.

20,000 MOTOR TRUCKS FOR ROAD WORK

More than $45,000,000 worth of motor trucks is about to be distributed by the secretary of agriculture through the bureau of public roads to the state highway departments. These trucks have been declared surplus by the war department. They must be used by the states on roads constructed in whole or in part by federal aid, for which $200,000,000 in addition to the former appropriation was given to the states under the same bill. All that the states must do to acquire the use of these 20,000 trucks, which range in capacity from two to five tons, is to pay the loading and freight charges.

Of the 20,000 motor vehicles to be acquired practically free by the states, 11,000 are new and 9,000 are used, but all are declared to be in serviceable condition. The motors will be apportioned to states only upon request of the highway departments on the basis of the requests received from the respective states, and in accordance with the apportionment provided in the federal aid law approved in 1916.

HOUSEHOLD QUERIES

(Continued from Page 827.)

To have it the proper strength is very essential. Having the lye the proper strength, put your grease in and start your fire. If, when it comes to a boil, the lye absorbs all the grease, add some more until some floats on top after the soap thickens, which it is apt to do almost as soon as it comes to a boil. I boil it half or three-quarters of an hour. Sometimes it seems thin at first but thickens after it gets cold; if it absorbs the grease it will be soap.—Mrs. E. T. Smith, Upper Lake.

Fisk Cord Truck Tires

Give Long, Uninterrupted Mileage At Low Costs

TRUCK Tires represent an important investment—and their selection should be made on the basis of the mileage they deliver plus their qualities of resiliency and safety.

Put Fisk Cord Truck Tires on your truck and watch their record; keep track of their long mileage—uninterrupted mileage; the freedom from repair bills; and the sure positive way they hold the road under all conditions.

These Cord Tires are so resilient that you can operate at speed without damage to working parts of the truck. That means less truck depreciation—your truck lasts longer and you get more work from it every day.

These qualities are Fisk features—the result of twenty years' of continuous tire-making experience.

Whatever kind of a truck you own, Fisk Cord Truck Tires will give you *uninterrupted mileage*, great tractive power, safety and remarkably low costs per mile.

Next Time—BUY FISK

"There is now a Fisk Tire for every motor vehicle that rolls?

REPRESENTING MILLIONS OF DOLLARS

Nearly a Billion of Dollars last year for California Farms. Much of that great wealth because of Irrigation. Most of this because of cooperation either voluntary or through Irrigation Districts. At one time the bonds of these Districts were not in highest favor but today they are as good as gold. The bonds create the wealth which makes their own value.

Overland
TRADE-MARK REG.

Why Model 90 Makes Friends of Owners

When a *stock* Model 90 Overland car broke the world's non-stop *high gear* record at Oklahoma City the other day, Overland owners were *not* surprised.

4,370 miles in 7 days and nights in *high gear*, over bad roads, through wind and rain, without one pause, was a performance that thrilled the crowd. Onto this wonderful mileage record was piled the gas record of 20.6 miles per gallon.

But Overland owners knew from experience how well Model 90 could perform.

This Model 90 record is of value only in explaining the appreciation Overland owners have of the economy and faithful performance of their cars. It explains how Model 90 makes friends of its owners. The demand is great right now.

By C. Thorpe,
Manager California Walnut Growers Association,
at Riverside Convention

THERE are two equally important factors in every horticultural enterprise—producing and marketing. The average horticulturist devotes over 98 per cent of his time to producing his crops and less than two per cent to marketing them. Yet the selling end is fully as important as the producing end. Of what avail is an abundant yield of fine quality without a ready and profitable market? It costs the average fruit grower at least ten times as much to produce his crop as is charged by cooperative organizations in intelligently marketing it.

Most of the large California growers' cooperative associations were organized primarily for the purpose of reducing marketing costs and obtaining a reasonable price for the producer without materially advancing the price to the consumer. All of these organizations, I think, in their early stages to a varying degree accomplished these results and thus reduced the number of hands their product passed through in its journey from producer to consumer.

But the modern and highly efficient producers cooperative association has developed a much broader field. Of course the economical marketing of the merchandise handled is still an important feature of the organization, but the larger growers' associations are now serving the grower, the trade and the consumer in so many other ways that the mere accomplishment of economically marketing the growers' crops is but a portion of its functions.

The California fruit grower of today generally is, or at least should be, a specialist. He properly concentrates his full business efforts on producing larger and better crops. The field of knowledge in his profession is so varied and intricate and is being added to so constantly that it takes practically all of his time to keep abreast of the latest developments in the most aproved methods of producing the crops he is specializing on. The California grower who gives a great deal of study to the most improved methods for producing his crops is the successful grower.

Every successful grower must necessarily give a great deal of his time to assimilating and putting into practice these modern producing methods. Consequently he has little time to devote in becoming a marketing expert, little time to give to legislative matters affecting his industry such as tariff questions, freight rates, etc., and it is utterly impossible for the individual grower to obtain unbiased market information and impossible for him to definitely know of foreign competitive conditions where the crops he is growing are also produced abroad and imported to America in competition with the domestic product. Consequently it is impossible for him to individually market his crop to best advantage.

Growers remaining independent of their organization usually turn the association's marketing information to their benefit, that is, they get under the association's umbrella by selling their crops on a basis of the association prices and not on their own judgment. This recalls a statement that one of our successful country bankers made the other day when he said: "I would have about the same opinion of a man who continued to sell his walnuts on the outside that I would of a man who used my bank for his convenience in cashing checks, but who made all of his deposits in the bank across the street."

Every large growers' cooperative association should be and generally is in a position to gain and disseminate all such information to its members. It should and generally does exert its every effort in securing fair and equitable freight rates and reasonable tariff protection for its members, and these growers' organizations are in a position to gain the best possible market information both domestic and foreign.

But particularly with regard to the California Walnut Growers Association. In 1914, when I became manager, our annual business totaled $1,800,000. We have since constantly expanded until our last season's sales totaled between $8,000,000 and $9,000,000 and we are expecting to do over $10,000,000 this year.

We market the output of 25 local walnut growers' associations located throughout the principal walnut producing districts of California. These local units receive, grade and pack the output of their individual grower members under standardized regulations and specifications of the California Walnut Growers Association.

The California Walnut Growers Association has no capital stock. Its membership is voluntary and members have the privilege of withdrawing at the end of each season. A similar withdrawal provision is extended the individual growers of the local walnut associations. Consequently we must give our growers satisfactory service and satisfactory returns in order to retain their membership, and I am pleased to say that our record since organization shows that we have gained in membership 42 acres for every one acre lost.

Prior to the organization of the California Walnut Growers Association the local associations marketed their output through the large California commission houses, paying six per cent commission for their sales efforts only—no other service was given by them. These local associations have never been charged more than three per cent selling expense on the f. o. b. value of the product by the California Walnut Growers Association, and this charge has sometimes been as low as two and one-half per cent. Thus, the selling cost has been cut in half. This reduced cost has meant a saving on the 1918 crop alone of a quarter of a million dollars to Association members. But the big point is that when the California walnut growers sold through the commission houses there was hardly a season when the crop was sold out at the opening prices. Almost always a heavy carryover resulted, with a subsequent material decline in price which, of course, the grower had to stand. The California Walnut Growers Association (notwithstanding prices have constantly ruled higher since the Association was organized) has always moved its entire holdings at the opening prices and has often, as this year, obtained a material advance for a perceptible portion of the crop.

But while we call our three per cent charge to the grower a marketing cost, it includes much other necessary and expensive service that the grower never received through the commission men. We maintain salaried representatives in the principal walnut producing countries abroad from whom we receive cable and mail advices as to the extent of the foreign crops, their quality, and the general market conditions abroad. We maintain a selling organization of over 150 representatives in the principal distribution markets of America. These representatives have been carefully selected for their ability not only as salesmen, but also for their ability in furnishing accurate information on the general conditions of their market which affect the consumption of our goods. Thus, the Association is in touch at all times with both domestic and foreign market conditions, and the information it thereby gains is invaluable in determining the best prices at which its product can be readily placed into consumption.

As important as market conditions is an accurate estimate of both the foreign and domestic production. We must be able accurately to judge the supply as well as the demand. An individual grower can but guess at the extent of either the foreign or domestic crop, whereas the Association's predictions on both foreign and domestic crops have, each season, been more nearly accurate than any other published estimates either by independent packers or individual growers, and this information has a great deal of value in enabling the Association to place the proper price on its product as only justified by accurate advance knowledge of supply and demand.

A few years ago the Walnut Association developed a field department service which I may predict will be shortly followed by most of the large cooperative organizations in this state, for with us this department has proved of very great value. As our industries enlarge our cultural problems increase. Both the federal and state appropriations for handling the growers' problems are grossly inadequate. The Walnut Association has kept two experts in the field under the direction of Professor Batchelor of the department of agriculture of the University of California, and through this department and the cooperation of the University, we are solving the cultural problems of the walnut industry. The three worst pests we have are the walnut blight, the aphis, and the codlin worm. Methods for eradication of the aphis have been perfected. The codlin worm, it is believed, will be controlled within the next year or two through the joint efforts of our field department, the state horticultural commission, and Professor Ralph E. Smith of the University. Apparently there is no possible method of control for the blight, but we have brought out new varieties of walnuts that are practically blight resistant. Our field department works on soil management, fertilization, pruning, die-back, root stock selection, bud selection, and all other cultural problems, and through the expenditure of less than $10,000 annually, and through the cooperation of the University, we have already solved problems which will mean the saving of several hundred thousand dollars annually to the California walnut industry. So I say that a similar field department will doubtless become one of the important features in every large growers' cooperative association in the near future.

The time was when overproduction meant a weak and declining market. Thanks absolutely to the California growers' organizations that time has passed. No unorganized industry can develop markets nor do anything to increase consumption. Only through the volume possible through organization can these things be accomplished. The California Walnut Growers Association has perhaps as wide a distribution of its product as any national sales organization in America. The greatest efforts are being made to develop an average per capita consumption throughout every section of America. Only through uniform consumption can the maximum demand be developed. To obtain and maintain uniform consumption requires a great deal of special sales work. An unorganized industry cannot do this, and in most of our California horticultural industries we are right now facing a period of greatly increased production which apparently has no limit. For instance, the production of walnuts is doubling about every six years. If we sit by and do nothing to increase consumption over-production will soon overtake us. Besides the special sales work which is a big factor in maintaining consumption, national advertising is a prime necessity. An unorganized industry cannot advertise.

Nor can an unorganized industry successfully attack unjust tariff legislation, discriminating freight rates, or obtain helpful legislation.

The California Walnut Growers Association accomplishes all of these things including its national advertising, special sales work where necessary, widens distribution, handles the national legislation, maintains its field department and has just organized a membership department to put on a campaign for increasing its membership, and markets its members crops at satisfactory prices and does all of these things at a cost to the grower of three per cent of the f. o. b. value of its product.

These accomplishments are only possible through the principles of growers' cooperative associations.

Agricultural News Notes of the Pacific Coast

Northern California

Shasta County will have good crop of olives this season.

The Glenn County Rice Growers Association has been organized.

Prune and apricot packing house at Chico is being overhauled and enlarged.

Siskiyou County is the latest to make concerted campaign against ground squirrels.

About 2,000 acres of spinach is being harvested on Natomas district for the Sacramento canneries.

Earle Mills, commissioner of Butte County, estimates a million hoppers to the acre in some sections.

Eldorado County farm center meetings: Kelsey, June 24; Placerville, 25; Cold Springs, 26; Union, 27.

Harvest of seed peas on the Natomas district is in full swing. About 5,000 acres were planted this year.

Milk distributors of San Francisco have been indicted because of alleged violation of the state anti-trust law.

Fred Kiesel has erected protected and fly screened stalls in oak grove for cows which are under full official test.

The Farm Owners and Operators' National Association, started recently at Stockton, is making campaign for members.

Glenn County farm bureau center meetings: directors' meeting, Willows, Saturday, June 21; Elk Creek, 25; Grapevine, 25; Larkin, 27.

Pear growers at Hayward, Alameda County, are contracting Bartletts at $85 f. o. b. point of shipment; No. 2 Canners are commanding around $50.

Yuba City will have another modern packing house for dried fruits. The Farmers Union warehouse will be used for overhauling and practical reconstruction.

Veterinarians have announced that conditions created by the rice industry are responsible for increase of insects which carry and spread contagious anthrax.

Contra Costa cow testing association is making some fine reports for its cows which are exceeding the 50 pound per month mark. One cow made 73.80 pounds of fat.

The Anderson-Cottonwood irrigation dstrict had for a time a serious shortage of water which has now been corrected. Additional pumping facilities will soon be available.

Nevada County reports that some of the canyons of the Sierra Nevada show countless numbers of the beneficial lady birds which are captured and sent to the various parts of the state to aid in control of aphis.

The recently elected directors of the Acampo, San Joaquin County, Fruit Growers' Association are: George L. LcFeber, president; W. W. Henderson, L. A. Hause, Asa Van Valkenburgh, Joe McKindley, W. H. Adams and L. C. Vertees, directors.

Earle Mills, horticultural commissioner of Butte County, recommends the use of grasshoppers in the construction of soup. He says that in the Philippines some 400 tons of grasshoppers are annually sold as a delicacy equal to shrimps, and he sees no reason why Butte County folks shouldn't enjoy such a delicacy to the limit.

Central California

Grain harvest is in full swing in the San Joaquin Valley.

Tulare County Live Stock Association plans for a show in Tulare in October.

A successful fight against grasshoppers is being reported in many parts of the valley.

Horticultural Commissioner Rutherford of Stanislaus County reports a 75 per cent kill in the squirrel fight.

Owing to low water supply Modesto and Turlock districts will have a much shorter irrigation season than usual.

It is proposed to unite some 16 creameries of the San Joaquin Valley with a capital approximating a million dollars.

County Adviser Jungerman of Stanislaus County announces a fat lamb auction to be held at Modesto, June 27.

The California Peach Growers recently distributed $900,000, this being the final payment on last season's delivery.

Many grain storage warehouses are being improved by putting in cement floors, and capacity is being generally increased.

Tulare County board of supervisors has voted to allow $1,000 for the expense of a citrus expert who shall be assistant farm adviser.

The Kings County Fair Association has elected T. E. Cochrane secretary. "The best ever" is the slogan for the next fall's fair.

Soledad, Monterey County, has organized the Salinas Valley Dairymen's Association. It is possible the association will install creamery to handle dairy products.

An evaporating company at Watsonville, Santa Cruz County, is planning a new feature of the industry, steam drying for fruit. The steam cured fruit is put up in sealed tin cans.

The Pajaro Valley apple output will doubtless be much larger than ever before, and it is thought that this year there will be a greater proportion of it cured than any preceding year.

San Joaquin Valley wheat growers have started a campaign to protect the grain growers' interests, and to that end have kept the wires to Washington warm urging modification of storage and dockage rates.

One cannery at Porterville has already booked orders for 110,000 cases of peaches and apricots, this season's delivery. The peaches are commanding around $80 per ton to the grower, which will mean around 50 cents to the consumer.

Packing houses of the Pajaro Valley which have purchased apple orchards are now selling to fruit evaporating concerns because it is claimed the promise is greater than for selling fruit fresh. Evaporators are now contracting at from 13 to 17 cents per pound for dried fruit.

Last year's raisin crop is being cleaned up as rapidly as possible, and growers are finding that some drying plants which made a special effort to save rain damaged raisins were more successful than was anticipated. Some raisins which it was feared would be a total loss have netted the growers $50 per ton.

Southern California

Ventura County farm bureau recently picnicked at Foster Park.

The San Dimas marmalade factory now has a packing house for cull oranges.

Many Southern California canneries are planning to open on July 1 on apricots.

Orange County's citrus acreage has increased 225 per cent between 1909 and 1918.

The San Bernardino Valley Potato Association has discontinued its organization.

Ventura County walnut growers report most satisfactory results from walnut dusting.

An important meeting of walnut growers of four counties was held at Hemet last Tuesday.

Blythe, Riverside County, recently shipped its first car of honey, which brought the bee men $3600.

Coachella, Riverside County, plans the erection of a factory for manufacture of date breakfast food.

Orange County bean and beet growers held their annual picnic at Huntington Beach last Saturday.

One 40-acre field of barley east of Brawley, Imperial County, netted 35 sacks to the acre and sold for $2.75.

Riverside County farm bureau has passed resolutions petitioning congress to repeal the daylight saving law.

Beaumont, Riverside County, recently observed Cherry Day. The Beaumont crop is much larger than usual.

A number of Eastern bred Jerseys have been distributed to the dairymen of Hemet and other Riverside County sections.

Ventura County reports Lima beans going out every day. Manager Essig reports little more than 100 carloads of holdovers.

Imperial Valley's tomato shipments during the month of May amounted to 67 full carloads besides 20,000 crates sent by express.

"Watch your tomato plants at this period for attacks of insects and fungous pests" is warning sent out by various farm advisers.

Redlands reports contracts for fumigation so general that its fumigation campaign will be more general than any preceding year.

The Rialto Heights fruit growers have been sending California grapefruit to Boston. The fruit has averaged them $7.35 per box.

Bean growers are planning a more effective marketing organization to take the place of the present pool which is organized only for one season.

With contractors ready to offer 26 cents for dried apricots, apricot growers are taking notice that their orchards get all the care they are entitled to.

Los Angeles and Orange Counties are engaged in an extended flood control plan; the first work in Los Angeles County was recently begun in San Dimas Canyon.

Castor bean growers who scored a loss on account of not being able to sell products are asked to file claims with the California Castor Bean Association, Santa Barbara, and the claims will be presented to the government.

The Coast and General

Maryland peach orchards repor crop far under normal.

Chas. J. Brand has resigned as hea of the bureau of markets, U. S. D. A.

Sugar beet blight is ravaging suga beet fields of Yakima Valley, Washing ton.

Sheep shearing in Colorado is finish ed, average clip running around eigh pounds.

An early June frost caught many o the cantaloupe fields at Rocky Ford Colorado.

Yakima County, Washington, leade of boys and girls agricultural clubs re ports a membership in that county o 65.

A carload of old horses has bee shipped from Mesa, Arizona, to Peta uma, California, to be used for poultr food.

Present estimates are that the Sa River Valley, Arizona, will have a output of between 1700 and 1800 ca loads of cantaloupes.

Many cattle fatalities have occurre in the Puyallup Valley, Washington because of wild parsnip and wate hemlock in the pastures.

A tractor demonstration was hel last week in Denver. Over 2700 acre of land were plowed up by tractor from 50 different factories.

Car lot shipments of apricots fro the Salt River Valley, Arizona, bega June 1. The first figs of the seaso came on the market about June 1.

Tractor owners in Maricopa Count Arizona, are to be urged to use som device on tractor wheels with lug which will prevent damage to th roads.

One and 22/100 inches of rain fe in Coconino County, Arizona, durin May. This is the heaviest precipit tion for May that has ever been re corded.

Chehallis, Washington, milk pro ducers have organized a cooperativ marketing association. The plan is t make it a state wide organization a soon as possible.

Hood River, Oregon, is shippin carlots of strawberries, the first ca having gone out on May 30. Recor prices have been received, usually run ning around $4.50 per crate.

Range conditions throughout Ari ona are reported as in fair to excellen condition, with the exception of the Grand Canyon country. Fat cattle from the range will soon be ready fo the market.

Hatcheries in the Salt River Valley of Arizona report an extraordinary season. The demand for day-old chicks has been so great as to be im possible to supply it, and many orders have been turned down, although the prices were 50 to 100 per cent higher than usual.

Sixteen thousand acres of land in the Salt River Valley, which has had only temporary water from the Roose velt reservoir by a recent vote of the council of the water user's associa tion has been granted permanent wa ter rights. These lands have pre viously been served with flood water and, for the past two years, under the stress of necessity for more food pro ducts, were furnished water the same as other lands under the project. This decision adds this acreage to the pro ject for all time.

More Milk, More Butter, More Cheese

By M. E. Bemis

THIS is not intended to be the "ultima palabra" in dairy industry forecast. In fact it will ever be impossible to tell the last word in dairy progress. There are some factors though which have a bearing on the future of the industry and may to some extent at least help one to predict the future of the dairy business in Arizona.

Conditions have been peculiar, and it is the peculiarity of these conditions that has resulted in the rise and decline of the dairy industry and the still peculiar, though different, conditions which now bid fair to rejuvenate the business once more and make it stronger and more profitable than ever.

As I have had occasion to say before to readers of the Cultivator, "Alfalfa, the greatest of all legumes, grows here to perfection. There may be other places on the face of the earth where alfalfa does as well as it does in the irrigated valleys of the Southwest, but there is certainly no place where it does better."

The general drift of the dairy industry has been towards those sections of the United States where feed is produced cheapest and where the winters are mildest. While New York and Wisconsin continue to lead in the number of dairy cows and will for many years to come, the drift has been largely southward and westward. Arizona, up to a year or so ago, had made the largest percentage of increase in the number of dairy cows of any state in the Union. During the past year and a half or two years the tide has turned and there has been a decrease, although the same general conditions have, so far as I am able to learn, continued to increase the number of dairy cows in practically all states which had previously shown something of the same increase that Arizona had.

Here is where the peculiar conditions that affected Arizona are shown. Previous to 1916 the acreage in cotton had not been a material factor in Arizona agriculture. In 1917 the acreage increased to 35,000 acres, more than double that of the previous year, which had in turn been a great increase over 1916 or any other year. Coincident with the increase of the acreage of cotton was a graduál increase in the price of hay and grain, without a corresponding increase in the price of dairy products. Dairymen who had by evolution developed from alfalfa farmers to dairymen merely as an expedient to sell their alfalfa, were much inclined to drop the dairy game and get back to the first love. Others seeing their neighbors apparently getting rich raising cotton were asking themselves why they too could not as well make some quick and easy money with cotton without the endless grind of milking cows twice a day.

This had its effect, and herds of cows have been sold, many at prices below their actual worth, because there were more sellers than buyers. Others have culled and culled to advantage; still others have sold their old cows and retained the young stock, and this is true to an extent which makes the proportionate number of young and old dairy cattle rather marked to the careful observer and encouraging to those who have regretted to see the number of dairy cows declining.

Right now we have the paradox of higher prices for butter fat than at any previous time in the history of real dairying in the state; prices that are rising instead of decreasing, and at a season of the year when ordinarily there has been a drop, and with it cheaper cows and less demand than when butter fat sold for not much more than one-half what it brings today.

I am not gifted with a prophet's vision and therefore any prognostication which I may make should be qualified with facts which substantiate, or at least confirm, the faith that is in me. With the facts before me, I firmly believe that a new era for the dairy industry is dawning for farmers in the irrigated valleys of the Southwest. Here in the Salt River Valley, we have had high prices for long staple cotton, and this has induced many to raise cotton who would not have been otherwise inclined to consider this as a commercial crop on a large scale. Many have planted their entire acreage to cotton, but this must of necessity be only temporary. In the article which appeared in the Cultivator of March 8 of this year I stated that my interviews with the best cotton growers brought out the fact that the largest yields were almost always produced on land which had previously been in alfalfa. Where cotton is grown continuously on the same land year after year the yield is bound to decline, and this is borne out by the experiences of growers here as well as elsewhere, though some of them are loath to admit it. Obviously, the time must come when much of the land in cotton must be reseeded to alfalfa. The Southwest Cotton Company has made a radical change in its farm management plans and has this year seeded a considerable portion of its land to alfalfa, although still growing cotton on a large scale, and the alfalfa seeding will be simply a means to an end, the growing of cotton more successfully.

What the price of cotton will be this fall is somewhat problematical, though not likely to be as high as the past season. The price will determine largely future plantings, but it is significant that while last year the increase was 100 per cent or more over 1917, which was an increase of 100 per cent over the year before, that the increase this season is only about 18 per cent over last season. It is also significant that there is a general tendency to reseed considerable old cotton land and plow up old alfalfa fields that have become infested with Bermuda or Johnson grass.

This is again an indication that the crest of the cotton wave has been reached, and it is doubtful if the acreage increases much beyond what it is at present. Probably the increased acreage in cotton will not equal the increased acreage of new land taken in each year.

The seed companies report a very marked increase in the sales of alfalfa seed this season over last which, together with certain facts which are known, proves conclusively that there has been and is a considerable effort to get unproductive alfalfa acres to producing the maximum, and this has been accomplished largely by plowing up infested and old fields that have run out and seeding down cotton fields that are in ideal condition to produce alfalfa.

Last season there was more activity in silo building than ever before; several hundred being built. This season more are going up, most of them of concrete too. The increased feed from the silos and from increased production of alfalfa fields due to reseeding and better management will in the aggregate amount to considerable and will proportionately increase the carrying capacity of the farms.

More important, however, than the increased feed production is the condition of the hay market. Previous to the entrance of the United States into the war troops had been stationed on the border and furnished a market for a considerable quantity of hay. Texas, which is one of the largest markets for hay from Arizona, has been a heavy consumer of hay, owing in a large measure to a drouth of several years in the western part of the state and also to army needs which increased consumption. These conditions, plus a world shortage of hay owing to the war, have made an extremely abnormal condition of the hay market of Arizona. Now conditions are rapidly changing; war conditions throughout the world are daily lessening the demands for hay. Generally, fair crops of hay in the localities which are competitors with corresponding prices have tended to restrict the market area, and at the present time hay can not be laid down at the logical markets at a price which will pay the grower here the cost of production. The consequence is that the growers will hold their hay to a greater extent than ordinarily. Although good prices have prevailed the early part of the season and a large part of the first and second cutting has been sold at fair prices, hay dealers do not hold out much hope of better prices for several months at least, and unless freight rates can be adjusted so as to be more favorable, it is extremely doubtful if prices will be encouraging to hay growers.

The condition of the hay market brings us back to something like the same conditions that prevailed before the war when dairying made such rapid strides in the Southwest. In other words, the alfalfa grower, forced to find a market for his product, sees in the dairy cow his salvation. Dairying today is not the crude industry that it was a few years ago. The silo is recognized as an important adjunct to profitable dairying. Milk houses are now required by the new state dairy law and creameries and factories are hedged about with restrictions which tend to protect the dairyman and give him confidence. All these things have a tendency to stabilize and make permanent the industry, for the farmer that turns dairyman now must expend more money for silos, milk houses and proper equipment and is not so likely to turn it down for some will-o-the-wisp industry that promises greater temporary returns. He will have too much at stake to quit the game as so many have in the past.

As I have said, butter fat is bringing more than ever before and the prospects of good prices for all dairy products are most excellent. Possibly we may not expect to supply Europe to so large an extent as during the war. Denmark's production of butter was curtailed, not so much because of loss of dairy cows as because of the impossibility of securing condensed feeds from America. Denmark has been and will be dependent upon America for cotton seed meal and cake as well as some other concentrated feeds. These will now be available and the production of butter brought back to near normal conditions, supplying in a large measure the needs of the United Kingdom. France, however, may be a buyer of dairy products, either American or possibly Australian, but any rate, opening a market. Milk in France before the war was six cents a quart and recently was selling for 17 cents according to reports of the United States bureau of markets. Cows which before the war were worth $58 advanced to $232.

The war has served to open up possible markets that did not exist previously, and to what extent these markets may be developed is only to be conjectured. As an instance, China has bought condensed milk to the value of $3,500,000 during the past year, and the American consul at Hong Kong says in a report to the department of state: "Present indications are for an indefinite continuance of the demand for American milk upon a scale not existing before the war." Other parts of the world offer markets for dairy products in small amounts, but many of these will add considerable to the world demands Cuba in 1918 doubled her imports of cheese from the United States. In Porto Rico milk and other dairy products are scarce. Even in Switzerland dairy products have doubled in value because of shortage.

Great as are the markets of the world and the opportunity of American dairymen to supply them, the greatest opportunities for extending the markets are right at home. The discoveries of Dr. McCollum, showing the value of butter fat as a part of the diet of animals and particularly of human beings, gives dairymen an opportunity to increase the consumption of dairy products in every section of the country. The consumption of milk, butter and cheese in every state in the Union might well be doubled, and will be if the dairymen and dealers in dairy products get down to a sane and systematic plan of advertising.

Never before has there been a brighter outlook for the dairy industry, and particularly in the Southwest Lower prices for feed stuffs, lower prices for good cows, and higher prices for dairy products, with the markets of the world open more and more to products of the dairy, and the dawning of an era when the markets at home will demand in an ever insistent voice, "More milk; more butter and more cheese."

SOUTHERN CALIFORNIA FAIR

Manager Van Pelt of the Southern California Fair Association at Riverside is already pushing for a real Southern California Fair October 7-11

Mr. Van Pelt says that one of the features of great importance will be the farm bureau exhibit. Various farm bureaus are expected to take an interest with the Riverside County farm bureau which is already busy devising a representative exhibit. One prize in the general exhibits, or rather in the county exhibits, which will be keenly sought for is $500 to the county making the best general agricultural exhibit. The second in merit will draw down $250; third, $125.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A scene near Willows in Glenn County is shown on the cover of this issue. Only a few years ago a large company organized this district, or rather a tract of several thousand acres, and financed an irrigation scheme which covered barren land—at least land producing but a few sacks of grain per acre—with wealth-giving water. These lands well repaid the effort, for during the past few years of war they have produced thousands of tons of fruits and other products, together with thousands of tons of rice and other staples—this because of irrigation.

AMERICAN BOTTOMS

At the beginning of the war America's products — which are so largely agricultural—were carried almost exclusively under foreign flags. To be exact, 9.7 per cent of America's exports and imports only were transported in American bottoms. Merchantmen now flying American flags constitute over 46 per cent of the shipping plying between our own and foreign ports, and this per cent is rapidly increasing. Compared with all the shipping of the world our flag now flies over one-fifth of the entire seagoing tonnage of the world.

One of the latest proofs of activities along this line is the establishment of a direct service between the ports of Los Angeles and the Orient.

JULY 1, 1919

Everybody knows that fully ripened peaches, apricots, grapes, potatoes and even alfalfa hay go to market cheaper and arrive in more salable condition if carted over roads rather than chuck holes.

Everybody knows that these roads cost money, and this money means more taxes or bonds, and this means that the voters must march up to the poles on Tuesday, July 1, and vote for California's advancement.

Everybody knows that California already has a greater mileage of good roads than most other states and that it has already advanced our prosperity. They also know that this is the next biggest state in the Union and that it takes great mileage to reach the producing sections.

Everybody knows

WE'VE GOT TO VOTE RIGHT

Because it is a state-wide necessity.

Because it will give work to returned soldiers, sailors and unemployed men.

Because it will prove of vital good to the farmer and fruit-grower.

Because it will aid materially in developing local manufacturing.

Because it will open up immense tracts of land for settlement.

Because it is to every one's financial interest and welfare.

Because it will extend and cheapen transportation to all users of roads.

Because it will vastly benefit every California county.

Because it will help effectively to cheapen the cost of living.

Because it will mark a milestone in the progress of California.

JULY 1, 1919.

TAXING TWICE

Now comes the money shark, or at least some influence is making itself felt in an endeavor to force taxation of federal farm loan bonds. In giving the farmer a chance at money on something like the same basis on which it is secured by commercial interests, congress saw fit to make the bonds which were based on the loans exempt from taxation. This has made these federal farm loan bonds attractive enough that they have been generally sought, and this has made possible the securing of the large sums necessary to finance the federal farm loan scheme.

The interests at work are very active and are flooding the country with literature advocating taxing the bonds. The claim is usually made that this affects only the large moneyed interests, but this is not true, for much of this money has come from those who are not possessors of large wealth, but small investors. Should this effort be successful it will result in the farmer being taxed twice—on what he owns, and again, under this proposed system, on what he owes.

The urban dweller has been for many years exempted from this double taxation to this extent at least, that where he was a home builder and has secured money from building and loan associations these monies have been exempt from taxation, the one taxation on his home being considered sufficient return. Stock in the federal reserve banks of the United States is exempt from all taxation, and the bankers owning these stocks receive 6 per cent dividends on them, yet nobody questions the propriety of this arrangement. Cities and towns issue municipal bonds for the purpose of paving and improving their streets and otherwise making city life convenient, comfortable and happy. These bonds and the income therefrom are exempt from all forms of federal taxation. This is a fine thing for the cities and towns because it gives the people a low rate of interest and enables these necessary improvements to be made, and nobody objects to it.

It seems to be different with the farmer, however, but the farmers are watching. In fairness to the bankers it is but just to say that little of this opposition has come from them. The California Bankers' Association at its recent meeting at Catalina was most cordial in its approval of these federal farm loans, which are now being made at the rate of about a half million dollars per month in this single Pacific Coast district.

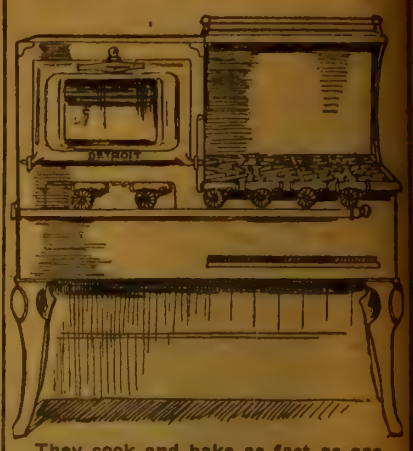
LABOR

Everything seems to indicate a serious shortage of labor during the harvest season. People talk of it; financial institutions in reporting business conditions refer to it and to the fact that the demands of Europe for food will be even greater than during the war. This is contrary to the belief of a few months ago when it was thought that the signing of the armistice, at least the signing of the final peace terms, would set all the idle busy and give reassurance to business conditions in those countries. But as time passes it appears that many Europeans are settling down to the belief that America will feed them in any case, and certainly this year's crop production of central Europe will be vastly under normal. This will induce continued demand on this country. With the disposition of organized help to devote its energies to increasing its wages and demanding many impossible labor conditions there will be less of real production than is anticipated unless labor employers study the situation seriously and make preparation for proper care and distribution of the laborers.

Plainly the time for falling prices has not come, and with the demand keeping up manufacturers are nearly all extending their operations. Building is becoming more general, and these activities are calling for increasing demand for laborers. A look-in at one of the largest federal employment bureau branches showed literally hundreds of men standing about and waiting for a job. A talk with the manager developed the fact that this one agency is placing a man every ten minutes. He can fill any order for help at once providing it does not take the men from the city. Thus far he has met all demands for ranch help, but has only a limited number at his command.

Manager O. V. Cobb of the Valley Fruit Growers Association at Fresno reports:

"We find that at the present time there is no shortage of farm labor, apricot picking and cutting is active, but so far orders for help are easily filled. We are now actively engaged in planning the erection of community camps in conformity with the state housing act taking effect July 21. By letters received from outside counties of California and Eastern states, and judging from the experience of the past and following along those lines, there should be no shortage of help during harvesting season, especially as we are perfecting a system of the proper distribution of labor, we shall then have at hand and avoid wastage of time, in securing new jobs for men and placing them at work which has been so common in the past."



This establishment of community camps and distribution of labor is most important. If reasonable assurance can be given to the laborers that they will be cared for during an entire season, the situation will be materially cleared.

OUR SACRAMENTO OFFICE

California is a big state. The Cultivator is the big farm and live stock paper of this state, so in an effort to give our readers an even better paper than we have in the past, we have recently established a branch editorial office at 210 Ochsner Building, Sacramento. We now feel that we are in a position to render the widest possible service to our readers and our advertisers—and service is the big idea back of the Cultivator.

Our new office will be in charge of our live stock editor, Mr. Royce, and will also be the headquarters of our fieldman, Mr. Bennett. We trust that our friends will make our office their headquarters when in Sacramento and that they will call upon that office for any service that we may be able to render. All mail pertaining to live stock affairs and inquiries should be addressed to the Sacramento office.

Detroit Vapor Stoves
"Work Like Gas"
Burn Oil, Gasoline or Distillate

They cook and bake as fast as gas and at a lower cost. Burn 19 hours to a gallon. No wicks or substitutes. Durable 8½-pound iron burners. Double walled ovens distribute the heat and use it twice. Write for descriptive literature.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

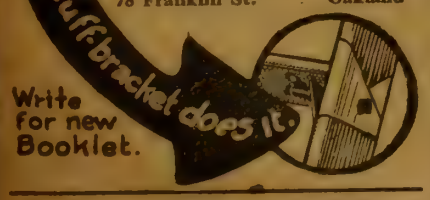
San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

REMEMBER THE



HORSE-SHOE TREAD

SECURITY KANT-WOBBLE LADDER

"Actually Pay For Themselves"
—says one progressive fruit grower who uses SECURITY LADDERS. The SECURITY cuts your picking costs by saving picker's time; cannot wobble, picker moves ladder only half as often; picker's time is your money—get SECURITY LADDERS, save his time, boost your profits. List of SECURITY dealers in 65 towns on page 749, Cultivator of May 31, or write me, at once:

J. B. Patterson
78 Franklin St. Oakland

When Writing Advertisers, Mention The Cultivator.

PREPARING FOR FUMIGATION

FUMIGATION of citrus orchards will be more general this season than any preceding year. More outfits will be in operation and it now appears the season will be longer. Work is already shaping up for a start on the campaign at least by the middle of next month. More outfits will start early in the month of August. County work, that is, work done under direction of the county horticultural commissions, will be less general than in preceding years, and there will be a number of private or cooperative outfits in every county. The citricola scale, which has induced early work in central California, is now found in some southern orchards, and, amongst others, Redlands will begin a campaign within the next few days on this scale. But even for black scale alone the campaign will be general, partly because the season has been very favorable for their increase and perhaps more because the exceptionally good prices for high-grade fruit induce better care of the orchards. Some orchardists formerly felt that one fumigation every three years was sufficient, but notwithstanding the cost of fumigation it has become more general and will continue to do so if present conditions continue to prevail. As some growers express it: "The scale is becoming used to fumigation, or to an extent is immune, so that stronger and more frequent treatment is necessary."

Possibly the pest is immunized. In any case, the grower is after him with the latest improved methods of fumigation. This of course will be through more general use of fumigation machinery, that is, apliances for manufacturing gas or for pumping liquid gas under the tent. There will be but few of the old-time interior generators in operation. The liquid gas proved so generally satisfactory last season that this method will probably almost entirely replace the former generation machine. There will be at least two large plants supplying liquid gas and machinery for its application.

MORE AIRPLANE PATROLS IN FORESTS

Two additional routes in the patrol of national forests by army airplanes, to give early warnings of fires in the forests, have been arranged by the war department and the forest service. The routes will be operated from Mather Field near Sacramento. The first will cover the northern Eldorado and Tahoe forests on the valley side of the Sierras. It will start from Mather Field and proceed to Placerville, Colfax, Nevada City, Strawberry Valley and Oroville, where the planes will land. This route will be covered in the morning of each day and return trips will be made in the afternoons.

The second route will cover the southern Eldorado and Stanislaus forests. Starting from Mather Field the route goes to Placerville, Grizzly Flat, Big Trees, and to a landing near Sonora or Tuolumne. This route will be covered in the morning and return trips will be made in the afternoons. Both of the Mather Field routes have a roundtrip length of about 150 miles.

Forest service reports tell of a successful trial patrol undertaken recently. No difficulty was experienced in detecting fires in heavy timber at elevations of 6,000 to 10,000 feet.

Secretary Walker writes that The California Tractor and Implement Association recently recognized the good work performed by Manager R. M. O'Neil in conducting the recent demonstration at Arden Acres near Sacramento, by making a material increase in his salary. Mr. O'Neil has also successfully managed the two last demonstrations held in Southern California.

A survey of Mormon Flats, Arizona, is to be made by the Salt River Water Users' Association for the purpose of finding a site for a new storage dam which will hold in reserve some of the flood waters below the Roosevelt Dam.

MOLINE MANDT MOUNTAIN WAGON

The Moline Line of Implements
Plows (steel and chilled)
Harrows
Pulverizers
Cultivators
Grain Drills
Lime Sowers
Mowers
Hay Rakes
Hay Loaders
Hay Stackers
Grain Binders
Corn Binders
Pitless Scales
Spreaders
Wagons
Moline-Universal Tractors
Stephens Salient Six
Automobiles

THE Moline-Mandt Mountain Wagon is now built according to United States specifications in standard auto track of 56 inches, and is built with a thorough knowledge of the difficulties of wagon traffic in all mountainous regions.

It is not merely an ordinary farm wagon built of heavier stock. It is correctly designed and properly proportioned to stand the extra strain and to resist the wear and tear of weather and of hard, rough-road hauling.

Axles, hubs, spokes, rims, reaches and poles—practically all wood stock, are one size larger than on ordinary wagons of same size. Special care is taken in selecting and air-seasoning the stock.

Wheels have heavy second-growth, white-oak spokes driven to place in glue. Hubs and felloes of same material.

All wheels and gear parts soaked in hot linseed oil before being ironed, and covered with two coats of old-fashioned red lead, the best and most expensive wagon paint known.

Moline-Mandt patent dust and sand-proof collars prevent wear. Extra heavy gear brakes with long, malleable iron shoes.

Ask your Moline Dealer to show you the Moline-Mandt Mountain wagon or write us for information.

American Centrifugal Pumps

It's a satisfaction to buy a pump that is absolutely guaranteed to the limit—your purchase is then a certainty and not a gamble. American Pumps are so guaranteed — by the manufacturers as well as by ourselves—guaranteed to meet all conditions specified, to perform the work efficiently, and to be free from defects of workmanship or material. Don't experiment—buy an American.

New Grape Syrups

By W. V. Cruess

THE past year has seen many announcements of wonderful processes by which the wine grape growers may be saved from ruin. Some of these "discoveries" would, if true and commercially feasible, enrich the wine grape growers far beyond the returns possible from wine making. One of the plans most commonly suggested is that of converting the grapes into syrup.

To date the writer has no definite information of anyone's undertaking seriously the manufacture of grape syrup upon a commercial scale. Evidently no one has enough confidence in the syrups proposed so far to invest any great amount of capital in the venture.

Until very recently the University has not been thoroughly satisfied with any of the syrups that had been produced. We have, however, since the publication of Bulletin 303, been able to develop a method which we consider superior in every way to any process thus far suggested and one which results in a product of undoubted commercial possibilities.

The process is based upon the concentration of the juice to a syrup by freezing combined with the ordinary vacuum pan process. When any sugary liquid is frozen pure ice first separates, leaving the residual juice enriched in sugar. This is especially true if the liquid is allowed to freeze slowly. Too rapid freezing causes the ice crystals to be too small to be easily separated and causes the ice to include part of the syrup. But if allowed to freeze slowly large ice crystals will form and can be easily separated from the syrup by means of a sugar centrifuge.

By two or three freezings and centrifugings it is possible to make a thin syrup of about 55 degrees to 60 degrees Balling. This is rather too thin for most purposes. In order to increase the sugar content to 65 degrees Balling we would blend with it a syrup of 70 degrees Balling made in a vacuum pan.

Syrup made by the freezing process contains all of the flavor of the original juice in a concentrated form, while that made in a vacuum pan has lost practically all of its grape flavor. This has been the principal objection to the vacuum method.

The freezing method was first developed by Monti of Italy but has been used for many years in the maple syrup regions where the sap is often allowed to partially concentrate by natural freezing. H. C. Gore has patented the freezing process described above and has given it to the public for free use without royalty.

We have made two different types of syrups: One for table use only, which is a light colored syrup of low acid and strong grape flavor; the second, a deep red syrup of tart taste and strong grape flavor. This latter syrup is not only a delicious "liquid jelly" table syrup, but is also excellent for beverage purposes when diluted with carbonated water or as a basis for sherbets, for ice cream sodas, ice cream sundaes, and finally as base for wine making. For the last purpose it is much more convenient to ship and use than raisins.

The syrups in both cases contain about 25 to 33 per cent of their volume of syrup made by freezing and 50 to 66 per cent of syrup made by the vacuum process. A very excellent red syrup suitable for wine making can be made without use of freezing.

In order to give an idea of the steps in the method the following outlines are given:

Red Syrup of Full Grape Flavor

(a) Crush and press ripe red wine grapes of any variety. Heat juice to 130 to 140 degrees Fahrenheit and return to skins for eight or ten hours to extract colors. Press. Heat to 160 degrees Fahrenheit. Allow to cool. Filter and concentrate in a vacuum pan such as used for grape syrup in wineries under 25 to 28 inches vacuum to 70 degrees Balling. Allow juice and syrup to remain in the pan never longer than 1½ hours; i. e., empty the pan often to prevent caramelizing.

(b) Crush and press wine grapes of good flavor, such as Semillon, or use Muscat grapes or in absence of these any sound clean ripe grapes. Heat to 150 degrees Fahrenheit, cool and filter. Freeze slowly in tin lined containers at five to ten degrees Fahrenheit to mushy mass of crystals and syrup. This may require 12 to 24 hours. Whirl mixture in sugar centrifuge. Discard the ice which remains in the centrifuge. If the syrup obtained is not concentrated sufficiently freeze it a second time to 0 degrees Fahrenheit or less and centrifuge again.

(c) Combine the syrup made by freezing with that made by the vacuum pan to produce a syrup of fresh flavor and about 65 degrees Balling. Allow to settle three weeks to remove cream of tartar.

(d) Place in cans or bottles and seal. Place bottles in water. Heat water to 150 degrees Fahrenheit for 40 minutes. Syrup is then ready for labelling and sale.

Table Syrup

(a) Use any variety of wine grape. Crush and press. Heat to 150 degrees Fahrenheit and add precipitated chalk to reduce acidity to .2 per cent (as tartaric); about ½ ounce of chalk per gallon. Cool. Filter. Concentrate in vacuo to 70 degrees Balling.

(b) Mix with this syrup syrup made by freezing to give syrup of 65 degrees Balling. Allow to settle three to four weeks. Bottle or can and sterilize at 150 degrees Fahrenheit 40 minutes.

Red Syrup for Wine Making and Table Use

(a) Crush and press any variety of ripe red wine grapes. Heat juice to 130 to 140 degrees Fahrenheit. Return to skins eight to ten hours to extract colors. Press. Heat to 160 degrees Fahrenheit. Cool. Filter.

(b) Concentrate in vacuum pan to 65 degrees Balling. Allow to settle three weeks. Bottle or can. Pasteurize at 150 degrees Fahrenheit 40 minutes. This syrup has a "blackberry jelly" flavor. It is excellent on hot biscuits, etc., and makes an excellent wine when diluted with water and fermented. It is the most easily made of the three syrups discussed and has ample merit to warrant the highest faith in its commercial possibilities.

Opportunity for Breweries

All of California's breweries will soon retire from the beer business. In many cases their expensive plants will remain idle or be sold for junk. Grape syrup can be made in most of them with very little expense for new equipment. All of them have a good supply of steam. Most of them have refrigerating plants in operation. These could be used for the freezing of the juice. Filters, glass lined tanks and kettles are at hand. A vacuum pan, grape crusher and press would have to be installed. The breweries of the Northwest have made a great success of loganberry syrup; the California breweries' opportunity lies in the manufacture of grape syrups.

CONSERVE THE SNOW

The conservation of snow seems to have but little interest for the California fruit grower when his orchard is surrounded by perpetual flowers. But it should have, and will have if he reads "Conservation of Snow: Its Dependence on Mountains and Forests," a pamphlet issued by the International Irrigation Congress.

California orange blossoms depend more upon the snows that fall upon the mountains than upon the rains of the winter season, and when the fruit grower sees the smoke arising that means snow conservation is being jeopardized by midsummer fires, he then begins to appreciate the fact that his greatest asset is being diminished. The pamphlet referred to discusses the question in part from the technical standpoint and largely from the timber standpoint, but the findings are applicable to the needs of the irrigationist. Regarding the increase in our resources the pamphlet suggests:

The development of the national forests to their full capacity means not only the control of the present run-off but also a large increase in the storage of snow, without in any

way jeopardizing legitimate lumbering interests. For pine, the timber of commerce, seems to prefer the warmer southern exposures, while fir, the most available cover for snow, thrives best on the shady northern slopes. The southern slopes, therefore, where snow can be protected only with difficulty from the direct rays of the sun, can be set aside for lumbering, while shaded northern slopes can be reserved for the fir, only sufficient fir being cut to insure the maximum storage of snow. At 8,000 feet and over, where protection from wind is temperate, the mountain hemlock or tamarack should be planted wherever conditions will permit their growth. In this way, water can be conserved for direct application where the soil is arable, without permitting a large portion of it to be evaporated or to run off uselessly. Furthermore, the greater portion of the seasonal evaporation will occur in summer through transpiration by the trees rather than in the winter through the effect of the wind. The transfer of moisture to the air will thus occur in the summer when its presence is most needed.

PEAT AS A MANURE SUBSTITUTE

Peat, finely pulverized after drying, has been used as a manure substitute and its value is often asked. On this point there is much difference of opinion. Plainly it is of great value as a mulch; it is also a carrier of nitrogen, but this nitrogen seems to be locked up in the inert peat which for ages has resisted the nitrifying bacteria. In answer to questions which have come to this office we quote the summary of Prof. John S. Burd's bulletin 203, issued by the California agricultural experiment station:

The substances commonly included in the term organic matter and derived from plant or vegetative tissues have a recognized value as soil amendments apart from their plant food contents.

Organic matter is contained in manures of all kinds, in straw, hay, etc., and in peat.

The commercial value of substances of the same kind, such as manures, should be based upon their percentages of organic matter.

Fresh peat contains about the same amount of organic matter as the average fresh manure.

Dried peat will normally contain less organic matter than manure of the same degree of dryness.

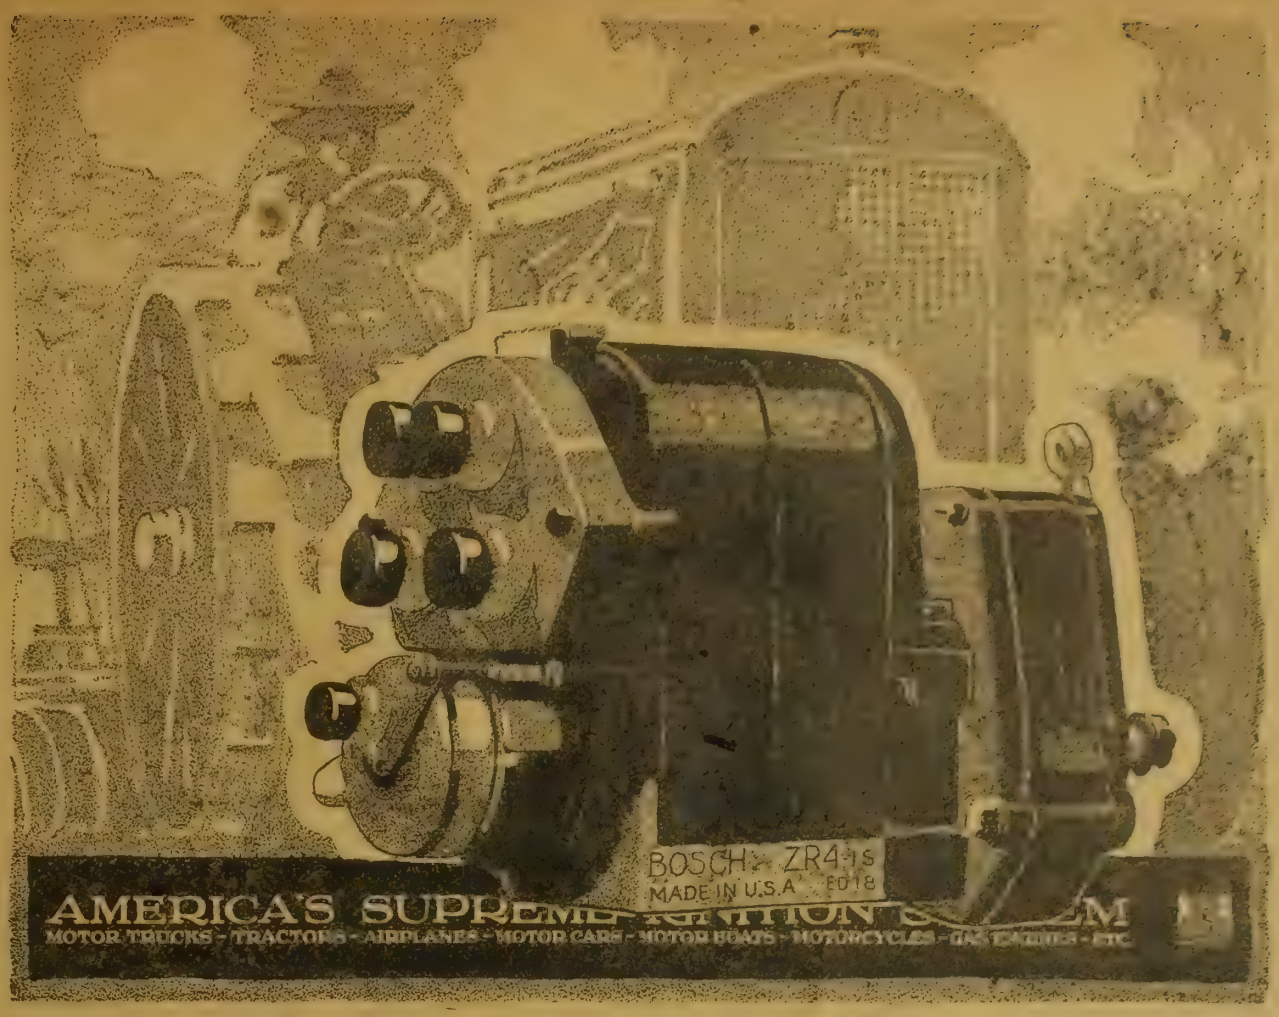
Peat, unlike farmyard manure, does not decay rapidly in the soil, nor is it readily nitrified; it cannot, therefore, be regarded as an available material.

We regard the inoculation of peat as a useless procedure and an unnecessary expense to the farmer.

Peat frequently contains considerable sand or silt, making it still less valuable agriculturally.

Any plant substance which has undergone partial decay in water is to be regarded as peat.

In the absence of more favorable results than those heretofore obtained in experiments with peat, the use of this material is not advised.



Farmers are especially advised that the plant food constituents of peat are not to be regarded as having the same commercial value of those of high grade fertilizers, nor is peat commercially or agriculturally as valuable as farmyard manure.

CALIFORNIA MAN FIRST AGRICULTURAL TRADE COMMISSIONER

The first agricultural trade commissioner to work in foreign lands for the interests of American food producers has been named by the United States Department of Agriculture. He is Edward A. Foley of San Francisco, who has been appointed to represent the department's bureau of markets in the United Kingdom. Mr. Foley will investigate conditions in the United Kingdom and study the marketing and distribution of farm products with a view to the development and improvement of foreign trade in American agricultural products.

Mr. Foley sailed for Liverpool May 24. As he is to do much traveling, at the beginning of the work, at least, his headquarters abroad have not been fixed.

Mr. Foley is a graduate of the law school of the University of California and has had experience eminently fitting him for the important post he is to occupy.

The Man Before the Plough

It used to be "the man behind the plough"; but today it is the man before the plough. Ploughs are now guided and pulled from the front. The Gas Engine leads agriculture.

The economy, durability and dependability of any Farm Engine is determined by its Ignition System. The searching strain of farm work demands magneto ignition and the qualities of Magneto Ignition reach their highest development in Bosch—"America's Supreme Ignition System."

Hot, intense and uniform—Rip Roaring Bosch Sparks get every atom of power from any fuel—kerosene, distillate, coal oil, tops or gasoline—in any Tractor, Truck, Automobile or Gas Engine. Bosch Dependability and Bosch Endurance have been proved through years of Supreme Service.

Any dealer can convincingly demonstrate Bosch Superiority. Every single Bosch Magneto for Farm Engines gets the continuous, expert Bosch Service of over 200 Service Stations in more than 200 centers, in all parts of the United States.

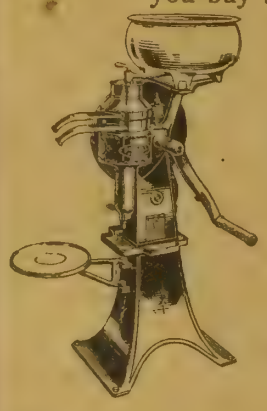
DE LAVAL



"The Distinguished Service"

CREAM SEPARATOR

There is service built into every part of a De Laval. Forty years of leadership in cream separator construction have made it the unquestioned leader in close skimming, light running, easy cleaning, and durability.

The De Laval is sold through local agents who are well informed with regard to the machine and the Company's policy. These agents localize the Company's service. They carry repair parts in stock and are trained to give intelligent advice and prompt help, in order to insure complete separator satisfaction and continuity of service.

There is a De Laval agent in every dairy community throughout the world—a constant reminder of the fact that when you buy a De Laval, the Company feels that its obligation to you has just started.

It is because of these facts that the De Laval has been justly called

Well-Known Dairymen and a Well-Bred Lady

By A. M. Nelson

The picture shows Ed. H. Webster, former chief of the dairy division, United States department of agriculture, inspecting Jessie Hengerveld Johanna, owned by James E. Peck of Brawley.

The photograph is taken on Mr. Peck's ranch in Imperial Valley where Mr. Webster is also ranching. Mr. Webster, with a firmly established reputation as a dairyman and agriculturist, earned through his work for the federal dairy division, as dean of Kansas experiment station, and as associate editor of Hoard's Dairyman, came to the Pacific coast as superintendent of one of the largest California creamery corporations. His work took him to Imperial Valley and after a study of dairy conditions there he resigned his position and went to farming south of Meloland in the valley. During April and May he has been putting up hay. On his first cutting he got three tons of alfalfa and oat hay and expects to average ten tons per acre for the year. In the fall he is going to Wisconsin to pur-

A Well-bred Lady

Jessie Hengerveld Johanna, butter seven days 27.83 pounds, milk 597.10 pounds. The gentleman at the right holding the rope is James E. Peck, owner of the cow. The gentleman standing just behind is Ed H. Webster, former chief of the dairy division, U. S. D. A.

chase a string of Holsteins for his Imperial Valley place.

Mr. Peck is now in the East, having attended the Holstein-Friesan convention at Philadelphia, June 4 to 7. He recently has made several additions to his pure-bred Holstein herd, among them Jessie Hengerveld Johanna, who comes from the Smith herd at Sumas, Washington. She has a seven day butter record of 27.83 pounds and is bred to Carnation King Sylvia, the bull which brought $106,000 when six months old.

Swine Show to Move

Cedar Rapids, Iowa, will not be the home of the 1919 National Swine Show scheduled to be held there in October. The reason given for abandoning the enterprise is that the various business interests of Cedar Rapids have been so heavily taxed since the recent starch factory explosion that they find it impossible to finance the show.

The new location has not been announced but a committee from the National Swine Growers' Association is engaged in considering the invitations of a number of Middle West cities and it is expected that their selection will be announced within a short time.

Jenkins' Jersey Sales

A. A. Jenkins, Tulare, reports the following sales from his herd of Jerseys: To W. W. Caldwell, Tulare, Gertie's S. V. Fern Lad, a son of Gertie's Son's Victor and out of the Register of Merit cow Smith's Mermaid. The dam has a record of 494 pounds fat as a three year old. Joseph Shively of McFarland secured a young son of Gertie's Son's Victor and Pretty Lady Celia. Mrs. Watts of Lindsay selected a son of Gertie's Golden Victor and out of G. S. V. Exile. The dam and granddam of this calf have Register of Merit records.

Mr. Jenkins states that he has never seen a more active demand for Jerseys than exists at the present time.

Morris Elected Holstein Director

At the annual meeting of the Holstein-Friesian Association of America held at Philadelphia June 4th, Frank L. Morris of the firm of A. W. Morris and Sons, Woodland, was elected as director to serve three years.

D. D. Aitken of Michigan was re-elected president and F. L. Houghton was re-elected secretary.

The Holstein-Friesian Association of America is the largest registry association in the world. The total membership is 14,322 and the total registration is 783,427.

Why It Pays to SALT YOUR HAY DOWN

When You Stack It or Bale It—

Because

It prevents musting

—checks the growth of molds when the moisture cent is high.

Improves the feed

—cattle thrive on salted hay and they like its taste. Stock will eat it up clean, where unsalted hay will be mussed over and wasted.

Increases the Milk

—makes the cows thirsty and they drink more water and produce more milk. Leading dairymen use salted alfalfa hay the year round for feeding their dairy cows.

Really Costs Nothing

—the salt more than pays for itself in the weight of the hay—holds the moisture, making 5 tons equal 6.

20 Pounds of Salt to Each Ton of Hay

—that's the proportion. And the method is very simple. Stack three feet of hay, sprinkle the salt over by hand; then another layer of hay, more salt, and so on.

Don't Fail to Try It This Year

Hardiness

Observe the calves of two different breeds; of one they live and grow without especial care; of the other they perish easily if they do not have the best of care.

Holstein-Friesian calves weigh 100 to 135 pounds at birth. Reasonably fed on skim milk and a little oil-meal, they grow like weeds.

If interested in

ciation, are making big preparations for their forthcoming midsummer sale. The committee which was appointed to visit the herds of the different breeders and select only such animals as conform to the standard set for their sales report the selection of 60 head of sows and gilts and all bred to the different herd boars of the breeders. The new sale pavilion now being erected and nearing completion will be dedicated by this sale July 16, 1919. Both Allen Thompson, president, and R. C. Sturgeon, secretary, state that they believe this sale should attract buyers from all parts of the West and are preparing for the entertainment of a large crowd. Col. Geo. W. Bell, now in the East, will have returned by that time and will be the auctioneer.

LIVE STOCK QUERIES

Alfalfa-Foxtail Silage

Two months ago I filled my silo with fine cut and closely packed first cutting green alfalfa and foxtail. This kept in fine shape but I cannot induce my cows to eat it alone or in combination with anything I have tried. Let me hear the solution and how I can get my cows to eat it. I have read that cows would eat such silage with "a relish." If I have made a mistake I would like to know and if the plan isn't feasible other ranchers should have the facts. — Riverside Rancher.

It is quite possible to make silage from green alfalfa and foxtail and a number of feeders report good success. Silage made from green alfalfa, or green alfalfa and foxtail, is invariably more acid than corn or sorghum silage and very often it is difficult to induce stock to eat. However, once they become accustomed to it they apparently do well.

Such feeds as alfalfa carry a large proportion of their nutrients in the form of sugars and proteids in the juices of the plant. These nutrients are readily decomposed and the value lost in the acid fermentation.

Your silage is probably very acid, and unless your stock eventually take to eating it, we have no suggestion to offer as to how you can correct the condition.

Raising Dairy Calves for Veal

I have been told that there is "good money" in buying very young calves from dairies and raising them for sale as veal. How should they be handled and fed? Is any preference shown by buyers as to breed?—P. H. S., Long Beach.

We would not advise an attempt to buy dairy calves for the purpose of feeding them out for veal. The fact that dairies are anxious to sell or give away calves is sufficient evidence that it is not profitable to raise them, and the experience of all who have attempted the business has been disastrous. Buyers prefer a Holstein calf or one sired by a beef bull.

Registration of Holsteins

Is it possible to register a Holstein calf sired by a registered Holstein bull and out of a registered Holstein cow if said calf is black or otherwise so off color as to cause suspicion as to previous ancestry?—W. A. C., Hemet.

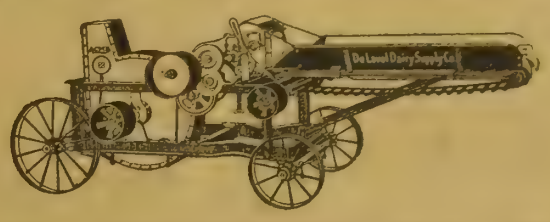
The Holstein-Friesian Association of America has the following rule: "Colors that bar registry: (1) solid black; (2) solid white; (3) black switch; (4) solid black with white on belly only; (5) black on legs, beginning at feet and extending to knees and hocks; (6) black on legs, beginning at feet and extending to knees and hocks, with white interspersed; grey or mixed black and white generally prevailing; (8) patches of other colors than black or white; red, brown, dun, etc.; (9) red and white."

The proper maintenance of farm machines not only saves money but avoids danger to those who operate them. Keeping the harness and vehicles in repair may prevent a dangerous runaway.

Companionship, good times, and a chance to make money are the three things a country boy or girl looks forward to finding in a city. Club work provides them in the country.

ACME Feed Cutters

Now is the time to buy an Acme Cutter for Chopping Hay and making Alfalfa Meal



Alfalfa meal made by the Acme will replace the bran ration and cost you only half as much.

Chopped hay will prevent a waste of from 10 to 20 per cent of your hay crop.

Chopped feed is all eaten. The coarse as well as the fine hay is all eaten—none is trampled under foot.

The Acme will more than pay for itself this season on dry feed cutting.

This fall you can use it for Silo Filling

EFFECTS OF WORKMANSHIP ON THE QUALITY OF BUTTER

By Thomas C. Moran, Oakdale Creamery

Paper presented at the buttermakers' meeting of the California Educational Butter and Cheese Scoring Contest held at Gustine, California, by the Dairy Industry Division, College of Agriculture, University of California.

THE effect of workmanship is more noticeable on the body of butter than anything else. In fact the body shows whether the workmanship is good or bad. The body tells the whole story of how the butter was made. Out of some 70 samples of butter at the Western Dairy Products Show there was not one sample that had perfect body. There were, I believe, two samples scored perfect on composition and color and if I remember right the highest commercial score was 93½.

Now it is very evident that there is something wrong either with the workmanship or with the judging. But whether the judging was right or wrong, there is no question but that there is plenty of room for improvement in the workmanship. I believe the defects of body are more often the result of trying to incorporate certain percentages of moisture than anything else. Still if we use the proper temperature we will have no difficulty in getting the maximum legal moisture content and the amount of working required will not injure the body. It is true that the longer butter is worked the shorter the grain becomes. In the first stages of working you will find the water is in large pockets and butter in this condition will leak, but as the working continues, the water is divided into smaller and smaller droplets. If you break a piece of butter and see little beads of water about the size of pinheads on the surface of the broken part, such butter is not overworked, and from a commercial standpoint is preferable to butter which has not been worked quite so long and has a longer grain and more open texture and is more liable to leak brine. A mistake that is often made, however, is to work butter until quite dry. This will cause it to be sticky and brittle and sometimes even tallowy. It is useless to try to work moisture into butter if there is none in the churm and before the butter gets quite dry is the proper time to stop. Leaky butter is something which gives you more or less trouble at this season of the year. When cows are fed on soft grass the butterfat is naturally soft and has a tendency to have weak, leaky body in butter. I don't suppose there is any creamery where leaky butter is continuously made but there are very few creameries which do not have a churning of leaky butter at some time or other.

Leaky butter may be caused by using too cold wash water, by too high salting, by churning too much butter at one time and by not working the butter long enough. The amount of working given butter has more influence on the way it holds its brine than anything else. Leaky butter invariably is low in moisture content and there is little danger of exceeding the limit by giving a little additional working, so that the question of leakiness is one which is entirely within the control of the buttermaker. There is one thing about leaky butter. Such butter is not overworked and if the flavor is all right the only loss will be the loss in weight through leakage.

The churning temperature has a great effect on the body of the butter. Many buttermakers do not take the time to churn at the proper temperature. Some believe, too, that it is easier to incorporate moisture if the cream is churned warm. The moisture content of butter is governed by the amount of working it receives. Other factors influence it to a certain extent, such as temperatures, sizes of granules, style of churn, size of churning, acidity and percentage of butterfat in the cream. There are two great objections to churning cream warm. One is that too much curd is incorporated in the butter. It is generally believed that off flavors in butter are due to an oxidation of the curd and it is advisable to avoid a butter with a high curd content. We know that a high curd butter will go off flavor much quicker than butter which is made and washed according to the

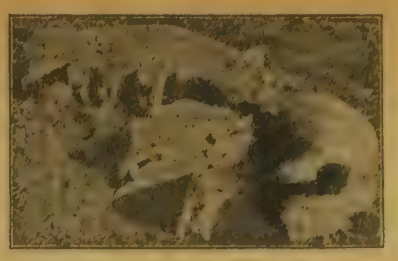
best method and has the minimum curd content, and any buttermaker who tries to increase his overrun by incorporating curd is sacrificing the quality of his butter. Another reason is that working soft butter either increases the amount of air or by reducing the size of the bubbles has the effect of increasing the surface exposed and consequently increases the rate of oxidation. Most everybody has noticed the rapid change that takes place when the surface of butter is exposed to the air. It becomes rancid in a very short time. Many people have assumed that butter would keep indefinitely if protected from the air but they forget that a large part of the volume of butter is air enclosed in small bubbles so that a large part or rather a large surface of the butter must be exposed to the action of the oxygen of the air. Deterioration in butter then being at least partly due to oxidation shows that any manipulation (such as the overworking of soft butter), which would increase the amount of air should be avoided.



Defects of flavor which come under the heading of workmanship may be caused by improper pasteurization and in the case of sour cream improper neutralization. I do not know of any part of the buttermaker's work which is more important than the neutralizing and it is one which is very often neglected or left to inexperienced help. The rate of deterioration in butter is in direct proportion to the acidity of the cream. Other conditions being the same, butter made from sweet pasteurized cream should when cream is churned without ripening, have a better keeping quality than that made from the same cream ripened even to a low acidity. If the acidity is developed to, say five or six tenths, then the difference is very marked. So in order to make butter of good keeping quality from sour cream it is necessary to bring it as near as possible to the condition of sweet cream by neutralization and pasteurization. By then churning this neutralized cream at a low acidity a uniform butter may be made which will reach the consumer in good condition and may even be put into storage with safety and not only can one creamery make uniform butter but any number of creameries can make butter of uniform flavor and quality so that dealer may be able to obtain a supply all of one grade and it also has the advantage of a better keeping quality. Not only will it reach the dealer in good condition but it will establish a reputation among consumers also. To the creamery man the flavor of butter as it reaches the consumer is more important than the flavor at the churn. Butter is just as old as it tastes and in the week or two that it takes to reach the consumer, it often becomes six months old. There is always a ready outlet for good butter, and the consumer is willing to pay a good price for it, and it will be noticed that when butter is accumulating on the market it is never the best butter that is accumulating. So it is our plain duty as buttermakers to turn out the best finished product that it is possible to make from the grade of cream that we receive, and if we cannot always make fancy butter we can at least make uniform butter.

GOES TO HELP THE DEAN

California cow testing associations lose an enthusiastic worker and supporter in the transfer of Edwin C. Voorhies from direction of cow testing work to the position of assistant to Dean Hunt of the agricultural college, which has made necessary his resignation from the work of the animal husbandry division. His successor in the animal husbandry work has not been appointed.

FARMERS' SHORT COURSES

The University Farm at Davis is already making preparation for the farmers' short courses which will be given September, 1919. A booklet with particulars as to the educational staff which will participate in these schools, together with general statement as to farm equipment and the six weeks courses makes up the book. It will be mailed to every farmer who is interested enough to inquire for it and who has appreciation of need for better mental and material equipment.

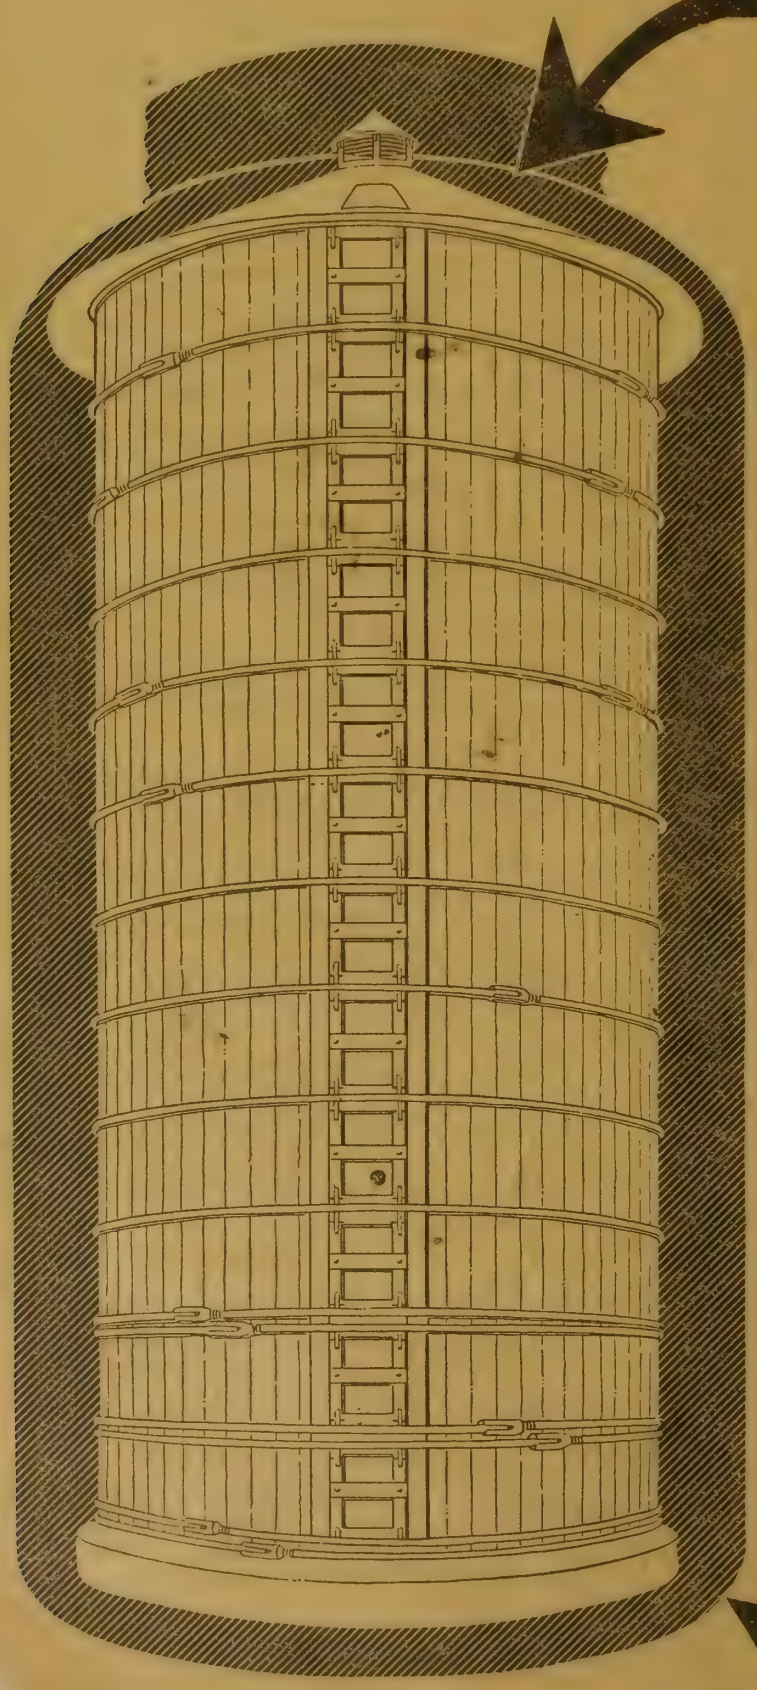
Arcata Testing Association Report

Professor E. C. Voorhies of the animal husbandry department of the University of California has forwarded a report of the Arcata Cow Testing Association for the month of May. This association which was organized this year has a membership of 45 and 1760 cows are under test.

Last month 122 cows were on the "honor roll." The association requires a butter fat production of 62 pounds or a milk production of 1000 pounds for 30 days for eligibility to the honor foll.

The leading cow last month was a Holstein owned by Joe Riberio. During the month she made the unusual record of 1816 pounds of 7.1 per cent milk, containing 128.9 pounds fat. A grade Jersey in the herd of Iver Iverson ranked second with 88 pounds fat. Three grade Jerseys belonging to Eugene Bondin produced 81.2 pounds, 79.9 pounds and 78.1 pounds fat. S. V. Foster's Jersey tied for third place with 81.2 pounds. R. S. Chaffey was fifth with Jersey credited with 79.6 pounds. Gregiro Costa was sixth with a grade Holstein that produced 79 pounds. James B. Kane was seventh with grade Jersey producing 78.4 pounds. W. Kirkpatrick and Eugene Bondin tied for tenth place with grade cows producing 78.1 pounds fat each.

Goat Show



AN ENTHUSIASTIC collection of milch goats and milch goat people gathered at the corner of Olive and Fifth Streets, Los Angeles, last Saturday. There were Toggenburgs, Saanens, Nubians and grades, 265 entries all told. At least half of these were Toggenburgs, the remainder being divided about equally among Saanens, Nubians and grades. The southern end of California now has about as many milch goats as all the rest of the United States combined, and this is true both as to pure breds and grades. There are some ranches which have thousands of grades milking, but these are as a rule not of high class producing stock. Pure breds are increasing rapidly, and this state will ultimately be a center from which stock will be drawn for all sections of the country. Importation has been prohibited for some years because of animal diseases in Europe where the best of pure breds are raised. However, in the matter of production it is claimed by the owners of some of the stock exhibited at the Los Angeles show that this section now has in actual producers a far finer showing of stock than any European country.

Judging the Kids

In the "ring" at the Los Angeles goat show. Two hundred and sixty milch goats were exhibited in the greatest milch goat center of the United States.

Some Ventura County Lima bean growers report rather poor stand on this season's seeding.

Can For Your Cattle

The Mason jar preserves food for your family—the silo preserves food for your cattle. You know that the air must be excluded from a Mason jar else the contents will spoil. The same is true of a silo.

When a silo is filled with green fodder, fermentation takes place, releasing the oxygen and generating carbon dioxide gas. The success of the ensilage process depends upon the action of this gas, which must pass through the entire mass of silage, driving off all air from within as it rises to the top.

If the walls of the silo are not absolutely tight, the carbon dioxide escapes through the nearest outlet, air is admitted and the silage spoils.

THE PACIFIC SILO

is built of heavy redwood staves, bound together by round steel hoops that insure a strong, air-tight container. Each stave is milled to the true circular outline of silo.

Twenty-five years' experience goes into the construction of the **PACIFIC** Silo. We build the **PACIFIC** of redwood because that is the most durable lumber, and the necessary lengths can be obtained free from knots and other defects. Besides, redwood contains a natural preservative, which resists fire and decay, making it the ideal material for silos.

The **PACIFIC** is as near perfect as any silo ever built. It is designed to stand any strain to which it may be subjected. It will not shrink, warp, or leak, and once erected will last longer than the average lifetime. Fill in the coupon and mail it today.

SACRAMENTO-YOLO COW TESTING REPORT

The report of the Sacramento-Yolo Cow Testing Association for the month of May records 116 cows on the "honor roll." In order to qualify for the honor roll a daily production of one and one-half pounds butter fat is required.

The top cow, a registered Holstein, owned by Bonita Stock Farm, Sacramento, produced 96.7 pounds fat during May. Two registered Holsteins owned by F. W. Kiesel, Sacramento, ranked second and third with 86.1 pounds fat and 82.7 pounds fat. Bonita Stock Farm also had the fourth, sixth, seventh and ninth cows, with 80.6 pounds, 74.7 pounds, 74 pounds and 73.4 pounds. A grade Holstein owned by J. W. Schultz ranked fifth with 76.8 pounds, and two grade Holsteins owned by A. W. Greene, Hood, ranked eighth and tenth with 74 pounds and 73.1 pounds.

The herd standings for May were: First, Bonita Stock Farm, 53 cows with an average monthly fat production of 47.1 pounds; second, A. E. Greene, 21 cows, average production 44.9 pounds; third, E. E. Bunnell, Hood, 49 cows, average production 39.9 pounds; fourth, F. W. Kiesel, 71 cows, average production 38.1 pounds; fifth, J. N. Dimmick, 16 cows, average production 36.7 pounds.

The Emigh-Winchell cup for the five highest producing grade cows for the

Twice Grand Champion

Model Defender Lady, 800 pounds, owned by Winsor Ranch, Bonita, San Diego County.

month of May goes to E. E. Bunnell of Hood, whose cows produced an average of 1.992 pounds of butter fat on the day tested. This class is open only to grade cows and a cow in the winning group once is barred from further competition. The five highest cows in the association last month were from the Bonita Stock Farm, whose average daily production was 2.57 pounds. This place was closely contested by five cows of the Jane Garden Farm whose production on the day tested averaged 2.41 pounds.

The directors of the association contemplate putting on another tester and taking on more members, there having been for some time quite a waiting list of those desiring to test.

SUGGESTIVE RESULTS

In a feeding experiment recently concluded by the experiment station, Manhattan, Kansas, in which six lots of steers were fed for a period of 110 days, two lots sired by Shorthorn bulls made profits per head of $18.75 and $19.20 respectively, while the losses on the others ranged from $18 to $37 per head. There is a responsiveness in Shorthorns that enables them to make good on the farms and ranches, in the feed lots and in the farm dairies. While these steers were making good in the feeding experiment at Manhattan there were also on the station farm a group of big, thick-fleshed Shorthorn cows that were bred for beef yet making milk records of practically 8,000 pounds per year. It is this ability to return profits through two channels that attracts the patronage of practical farmers and stockmen.

LIVE STOCK SHOW

With $6500 already invested in their sales pavilion at Tulare the Tulare County Live Stock Association has decided to put in an equal amount for additional buildings to accommodate features for the live stock show which will be held the week of October 6 to 11. The Tulare board of trade has taken up the work of disposing of the additional stock in the association and at their first meeting secured over $2000 of the needed amount and will begin a selling campaign this week to secure the balance. To add to the amount of prize money to be offered at the show the board of trade will stage a Fourth of July celebration similar to the one held last year when $6500 was raised for the Red Cross.

MADE IT WORSE

Mr. Plain—You are sure to admire him; he's a strikingly handsome man.

The Girl—I'm glad he is. I simply detest homely men. (Suddenly starting blushing). Oh, I beg your pardon; I didn't mean to say that.

Don't despise the little things. It takes a myriad of fragrant blossoms to make a field of clover.

Shorthorns of Rare Quality

Carruthers Farms Second Sale

Thursday, July 10, 1919

State Fair Grounds **Sacramento, Cal.**

45 Registered Scotch Shorthorns

42 Females 3 Bulls

An Event That Will Make Shorthorn History in the West

In this sale Mr. W. M. Carruthers, owner of Carruthers Farms, Live Oak, California, is making an offering of Scotch cattle of such noteworthy breeding and individuality that it is attracting the interest of leading breeders and lovers of the breed even throughout the mid-west stronghold. Those who are fortunate enough to be present on sale day will unquestionably witness the recording of a bright new page in the history of the breed in California.

Hallwood Villager

the wonderful white bull by Village Flash and out of Lavender Queen, will be a feature of the offering. He was first prize two year old at Sacramento last year, and is unquestionably the greatest combination of Shorthorn breeding and individuality yet led into a western sale ring.

Many of the very greatest Shorthorn tribes are represented in this sale by males and females individually worthy of their inheritance, and it is entirely conservative to state that no Shorthorn offering of equal merit has ever appeared in a single western sales ring. Practically all of the Carruthers Farms show herd will be sold, and it will be a real opportunity to strengthen an established herd or found a new herd with animals of outstanding breeding and superb individuality.

Practically all of the cattle are now on the sale grounds at Sacramento, and those interested are cordially invited to call and see them.

Eggs From Five Counties

How they are collected, graded and marketed by the Poultry Producers' Company of Southern California.

By Jean A. Koethen

WHEN the Poultry Producers' Company was organized in December, 1916, less than three years ago, the enterprise was not received with great enthusiasm by many poultrymen. Enthusiasts there always are; they are the people who move the world; and the men who had talked and written and conquered objection after objection until the first board of directors was finally elected were of their number. But there were many doubters, men who couldn't see, and didn't know, and suspected the other fellow was trying to put one over on them somewhere. Nevertheless, because something had to be done to keep egg prices commensurate with their cost, the Poultry Producers' was organized.

As its name indicates, the Poultry Producers' is an organization of poultrymen. In order to be a member a man must own a sufficient number of hens to sell eggs by the case and must purchase a $10 share of stock for every 1000 hens owned. The owner of 2000 hens must therefore invest $20 in stock. He must also sign a marketing agreement, pledging himself to market all his eggs except hatching eggs, through the organization. "What about selling a dozen eggs to a neighbor?" I asked Mr. Davison, the president, as he was explaining this feature of the organization. "Oh," he chuckled, "that isn't commercial marketing; that is just accomodation. We don't say anything about such trifling matters." From which I gather that the Poultry Producers', unlike some corporations, really has a heart.

The board of directors consists of ten members, five from Los Angeles County (one each from Van Nuys, San Gabriel, Gardena, Pomona and the Burbank district), one each from Riverside, San Bernardino, Orange and San Diego Counties, and a member at large who is a representative of the state market director. The list of directors at present includes T. C. Browning, J. M. Davison, W. L. Grubb, B. R. Holloway, T. M. Hurley, A. J. Neimeyer, L. W. Prewitt, C. G. Ross, M. A. Schofield and the representative of the market director, A. O. Martin. The officers elected for the present year by the directors are: J. M. Davison, president; W. L. Grubb, first vice president; B. R. Holloway, second vice-president; L. A. Brooks, secretary and treasurer; H. W. Stanley, manager. The secretary and manager are the only salaried officers, the others being paid merely for the time spent in attending the monthly meeting of the directors and the weekly meeting of the committee.

All expenses of the organization are defrayed by a flat charge of two cents per dozen for all eggs handled. As this two cents a little more than covers the operating cost a refund is made at the end of each year. Last year 1½ cents covered this expense and the extra one-half cent was returned. In order that the whole of the $100,000 capital stock may be taken by actual producers, one cent is deducted from the price of each dozen eggs to be applied to the purchase of additional stock. That is to say, if a producer markets 75 dozen eggs in one week, 75 cents of the proceeds is put away to pay for more stock. When $10 has accumulated in this way, the producer receives another share. By this method all stock is kept in the hands of the producers and is distributed strictly in proportion to the number of hens owned. There are now 500 stockholders.

Handling the Eggs.

The Poultry Producers' keeps an account with every individual producer and in order that there may be no mistakes every shipment is checked 13 times between the front door of the company's building on Industrial Street, Los Angeles, and the train or truck which carries it to market or storage.

The eggs come in daily by truck, except those from San Bernardino, Orange and San Diego Counties, which are shipped by express. Arrangements with the truck drivers are made by the local poultry associations. The Poultry Producers' has nothing to do with them until they are delivered on the pavement at its door. It costs 11½ cents per case to ship from Gardena, 15 cents per case from Van Nuys, 12½ cents from San Gabriel and 26 cents from Riverside. The truck, when it calls at each ranch for the cases of freshly-packed eggs, leaves as many empty cases as it took away filled at its last call, all cases and fillers being furnished by the organization.

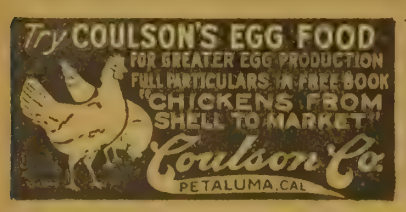
Every case of eggs is entered in a receiving book under the producer's name before it is carried inside the building. In the candling room it is checked again, and again when the different grades of eggs are packed in their respective cases. They are checked when they are classified and again when they are stacked. Every man who touches them checks them on the producer's card, and by the time they have passed through the 13 hands necessary to take them through the building and to make out the weekly statement, every possibility of a mistake is eliminated.

Candling and Grading.

In the long dark candling room 16 candlers were busy the day I was there. In the height of the season the work requires 20. They receive 60 cents an hour for a nine-hour day. Here, by the aid of a carefully shaded droplight and two sets of scales for each candler, the eggs are graded as Extras, Pullets, Dirties, Brown, Brown Pullets, Peewees, Crax and Rots. Peewees are the very small eggs laid by pullets that are just beginning. The difference in the prices received for the various grades is shown by that day's price list: Extras, 51 cents; Pullets, 48.7; Dirties, 50; Browns, 51; Brown Pullets' 48.7; Peewees, 42.8; Crax, 47.66. It will be noticed that there is no difference in price between brown and white eggs, but it is necessary that they be graded and packed separately. The price paid for Peewees seems surprisingly good considering their small size. The cracked eggs are perfectly good if used immediately. They are sent out at once to the retail market.

Extras must be absolutely clean and weigh at least 22 ounces and they must average 24 ounces to the dozen. No egg that weighs less than 22 ounces can be classed as an Extra.

Dirty eggs cannot be Extras, but if perfect in other respects they sell as Firsts. Eggs that have been washed show it very plainly before the candle. They cannot go into storage but are sold for immediate trade without reduction in price. Dirties may be stored for a short time but only clean, sound eggs are put into storage for a long period.



Thanks to the educational campaign which has been in progress for several years, very few Rots come in, not more than an average of one to a case, and there are comparatively few fertile eggs.

Advantages of Organization.

In the office five or six expert bookkeepers, under the direction of the secretary, L. A. Brooks, keep accounts and make out statements. Mr. Brooks is the livest wire I have met in many a day and has all the financial affairs of the organization at his finger ends. The organization, he told me, has three distinct purposes:

1. To stabilize the poultry industry in Southern California.

2. To open up foreign markets for producers In order to take advantage of exceptional prices in the East, the California producer must ship in car-

A Vision that brought Victory

They called them "Tanks" upon the Western Front because, in order to deceive enemy spies while they were being built, the British Engineers circulated the story that they were rolling water tanks, destined to carry fresh water to the troops in Egypt.

What they actually *did* do is history! And it is a very bright bit of history to the men responsible for the "Caterpillar" Tractor.

Speaking to the employees of The Holt Manufacturing Company at Stockton, California, a British General said:

"It (the machine gun with which the Germans did such terrible work against the unprotected Allied infantry) was really a disease against humanity, invented by the late Hiram Maxim; so you Americans not only have the credit of producing the disease but you have the credit of producing the antidote too. The antidote was the Holt 'Caterpillar' Tractor, invented by your employer, Mr. Benjamin Holt."

Each time one of these "armored mobile land fortresses" leveled an enemy trench or pill-box, it furnished an added proof of the superiority and soundness of principle employed in the "Caterpillar" Tractor.

And in addition to the Tanks, thousands of "Caterpillar" Tractors were in service in the war zone—hauling the big guns and ammunition trains into position — moving vast stores of food and supplies for the fighting men —*laying their own continuous tracks* over battle-torn, shell-pitted roads and fields in every kind of heavy and strenuous traction service.

American agriculture may well be proud of its contribution toward the winning of this war, for this farming machine, invented and built by Benjamin Holt to till the soil, has been a commanding factor in sounding the death knell of vicious autocracy.

American farmers patriotically accepted the situation created by the fact that the Government, during the war, had first claim upon the products of the Holt factory and that only a limited number of "Caterpillar" Tractors were available for domestic use. But now the war is over and immediate deliveries are again possible.

The same efficiency of performance—the same durability and strength under heavy usage—the same superiority and soundness of principle—all the qualities which enabled the "Caterpillar" Tractor to do such effective war service are at the disposal of the American farmer. Today the "Caterpillar" Tractor, always the leader among tractors for agricultural and other peace-time uses, but now backed by severe war-time service and experience, is better than ever before.

"Caterpillar" Tractors—built only by Holt or under Holt contracts and patents—the only track type of tractor adopted, after rigid tests, for the hardest war service of America, England and France.

The "Caterpillar" Tractor promises to be one of the greatest mechanical agents of the reconstruction. Write today for full information—ask for catalog 402.

THE HOLT MANUFACTURING CO.
STOCKTON, CALIFORNIA PEORIA, ILLINOIS
SPOKANE, WASHINGTON LOS ANGELES, CALIFORNIA

load lots, and this only a very large concern can do. Last January when the cold weather sent New York prices sky high the Poultry Producers' was able to ship seven cars a week, and for these carefully packed California eggs it received a cent a dozen more than was paid to near-by Eastern poultrymen.

3. To eliminate waste in the distribution of poultry products. The country grocer has never been a desirable factor in egg marketing. He buys whatever is offered him, without grading, paying as little as possible and in hot weather often keeps the eggs till they are far from fresh. Eggs are delivered to the Poultry Producers' within two or three days after they are laid and are disposed of according to their keeping quality.

Profit is not one of the objects of the organization, but it is compelled to put eggs in storage during the months of heavy laying in order to stabilize prices. Some profit is bound to accrue, and in April of this year the profits from stored eggs paid a ten per cent dividend. This spring eggs went into storage at from 47 to 51 cents, a phenomenal price, and extremely high prices next winter are looked for as the inevitable consequence.

Every Friday checks for the eggs received up to Thursday night of the previous week are sent out, and the volume of business done is shown by the fact that checks sent out the third week in May amounted to $35,000. The following week they amounted to only $32,000, and a slight reduction is to be expected during the summer and fall.

The Poultry Producers' believes that it is doing an important work in raising the poultry industry to a higher plane. The purposes for which it was organized are being realized and its members are no longer compelled to market their eggs at a loss. It deserves the support of every large producer of eggs.

Best Way to Grow Tomatoes

By A. F. Clarke

THIS is about the time of year that the old-time controversy over the best manner of growing tomato vines takes place. Shall they be tied to stakes and trimmed up to assume tree shapes or shall they be allowed to sprawl over the ground in the manner that nature apparently intended.

Well, now, that depends. When field culture on a large scale is planned the staking method is of course impossible because of the labor involved. Under these conditions the plants should be not less than three feet apart in rows and the rows not less than four feet apart. These distances should be increased rather than decreased.

In staking the "three stake" method will be found best for the home garden. The plants under this method may be set 18 inches apart in rows three feet apart. Ordinary laths are driven into the ground in triangle form with base about ten inches each way and the top a little more. Common binder twine is wound around the laths, looping at each lath.

The plant thus enclosed is quite severely pruned. The string should be placed under the branches and tied to the laths with loops. The staking method, with its attendant heavy pruning, will produce tomatoes considerably earlier than the other methods.

A compromise between the open field method and the staking plan is the "fodder mulch," and this is feasible only where shocks of corn fodder are available. This plan consists of mulching the entire row of tomatoes with corn fodder or other suitable mulch—barley straw may be used—on the south side only. The plants are allowed the sprawl over the fodder, which keeps the fruits off the ground and by reflecting the sun aids materially in quick ripening. The natural habit of the tomato is to sprawl over the ground, and by this plan the area of branches is greatly increased and will be found to produce more fruit than when plants are staked. The fodder also serves to hold the moisture in the ground and its warmth invites the insects that pollenize the early fruits.

Under whatever plan is followed one should go over the plants once a week and remove all shoots starting in the axils of the leaves. They merely draw from the plant and prevent its best development.

A teaspoon of crushed nitrate of soda crystals to the plant will hasten ripening and is an aid in holding the blossoms on the plants when they have a habit of falling early in the season. Sow broadcast on the surface but do not allow the crystals to touch the plants. This dosage may be repeated with success every ten days during the season.

Tomatoes should not be irrigated during the blooming season, and in general it is better to give the plants water only when they appear to be in need of it. Many tomatoes are produced on a commercial scale without irrigation in several sections of Southern California. Thorough preparation of the soil and constant cultivation afterwards is the secret of this plan. This is, of course, not feasible in the hot interior valleys where fortnightly or even weekly irrigation in the heat of the summer is practiced.

The tomato is not particular in the matter of soils, but does better on rather light, loamy soil where conditions favor rapid, vigorous and unchecked growth during the early part of the season. The California adobe is perhaps the least desirable tomato soil, but the crops grown on some of the adobe land in Puente valley would seem to argue that cultural methods more than soil make for tomato perfection.

The Stone is the favorite canning variety, the Beefsteak or Ponderosa, John Baer, Home and other varieties giving the home gardener the needed variety for mid-season and late crops. The Earliana, Chalks' Early Jewel and early June are favorite early sorts.

SWEET POTATO STORAGE

The matter of sweet potato storage is receiving more attention this year than any preceding year. Methods of handling have been studied by the experts of the department of agriculture and others, and it is declared that processes are now perfected, one or two of which are patented so that now it is possible to store and practically insure the keeping qualities of sweet potatoes. There is a movement on foot to install these curing and storage plants in California. If this is done there will be greatly increased production and California has possibilities in sweet potato production which have never yet been fully realized.

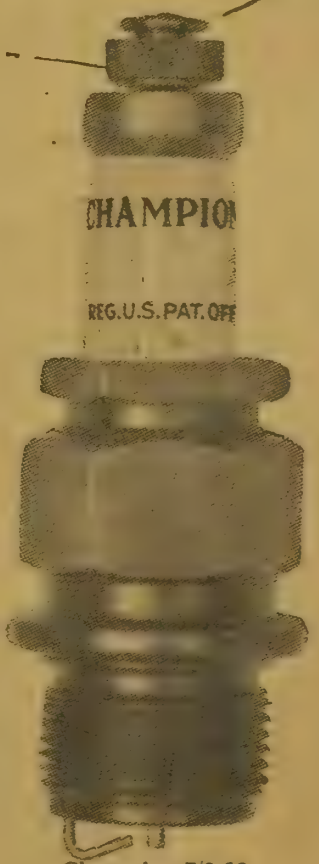
Champion Dependable Spark Plugs

Dynamometer Test in Engineering Laboratories, Champion Factory, Toledo, O.



Dynamometer Test Guarantees *Dependability* of Champion Spark Plugs under *all* Service Strains

NO MATTER what type of automotive engine you have, nor under what service conditions you put it, the Champion Spark Plugs recommended for that particular type of engine have already shown a 100% efficiency record under exactly similar service strains.

In the Dynamometer Department of our laboratories various types of engines equipped with Champion Spark Plugs are being run at all times under the most severe conditions.

The greater resisting power of our famous No. 3450 Insulator together with our patented asbestos gasket construction and coupled with extreme care in manufacture, close inspection and rigid production tests enable Champion Spark Plugs to stand up and keep going better and longer.

There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Almonds in Coachella

Would almonds prove profitable in Coachella Valley? What varieties would be best and how much water would be required to irrigate?—Subscriber, Long Beach.

The climate of Coachella Valley is as well adapted to growing almonds as any part of California. However, saline soils should be avoided as should poorly drained lands. It must be remembered that surface appearance is no indication that the subdrainage is good, a very essential condition for almond culture. The soils of Coachella and Imperial Valleys are deceptive. They are apparently well drained and porous in many sections but there is, almost invariably, a layer of clay underneath that holds water like a tub. The soil deposits are sand and clay, one on top of the other to a great depth. This makes the planting of trees intolerant of seepage water rather risky unless great care in irrigation is used. Plant IXL, Drakes, Ne Plus Ultra and Nonpareil. —J. W. M.

Cure for Sore Ears in Rabbits

I have read from different ones inquiries for remedy to cure sore ears in rabbits and have never seen the simple and sure remedy that we use so decided to send it and ask you to give it to the Cultivator readers. It has never failed to cure any case of sore ears no matter how severe. Simply coal oil, from about ten drops to half a teaspoon, and in some instances we have had to repeat the dose in a few days. It has never injured the rabbit. — Clara E. McLellan, Alta Loma.

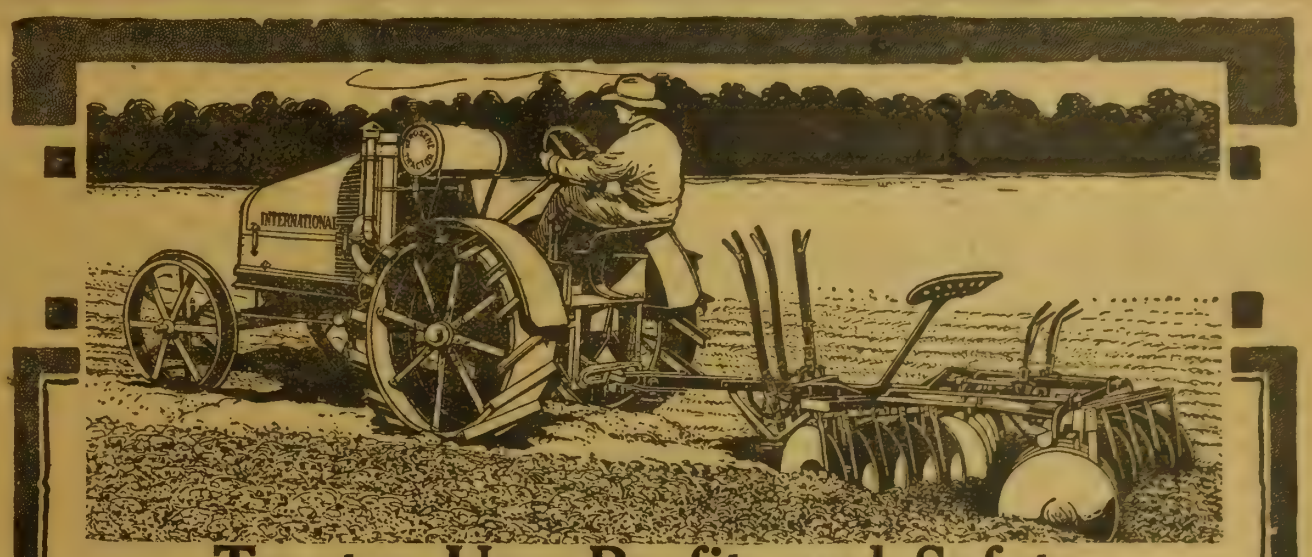
Rust on Rose Leaves.

Please tell me what is wrong with my rose bushes and what is the remedy. You will notice by the enclosed leaves that the underside is covered with a rust colored substance. The bushes look as though they would die before long.—Subscriber, Pasadena.

This is one of the rusts which seriously affects certain roses. Its treatment is practically the same as treatment for mildew. That is, spraying with sulphide of potash, one ounce to three gallons of water, and dusting over bushes, after spraying, with flowers of sulphur.

Apricot Trees Dying

Apricot trees about 10 years old are dying. A great deal of sap is exuding from large branches. They set a big crop but the fruit is all drying up. What can I do to prevent this trouble? Will it spread to other trees? —Subscriber, Ballard.



The best answer we can give to this with the limited description of the trouble is that it may be due to some physiological condition not fully understood, which means in simple language, we don't know. It may, however, be due to shot hole and leaf spot trouble or sour sap or other trouble. The only remedy which can be suggested until further information is secured is abundance of water, a little fertilizer and bettering of physical conditions of the soil. This is a case where your county horticultural commissioner may probably be able to give you very material aid.

Curing Medicinal Herbs

Is it practicable to dry medicinal herbs and plants with any kind of evaporator or other machine?—Subscriber, San Gabriel.

We know of no special appliance for this purpose. This matter of specialized crops calls for treatment which can only be learned from the drug supply house or others who contract for these herbs or plants. The first step is to determine which particular medicinal plant it to be grown and the requirements of the trade for that plant.

Plans are under way in Maricopa County, Arizona, to purchase a landing field for airplanes and build a hangar as a permanent memorial to Frank Luke, Jr., the Arizona ace whose daring in bringing down German observation balloons and airplanes cost him his life and won for his family the congressional distinguished service medal.

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

The Full Line of International Harvester Quality Machines

Grain Harvesting Machines
Binders, Push Binders, Headers, Rice Binders, Harvester-Threshers, Reapers, Shockers, Threshers

Tillage Implements
Disk Harrows, Cultivators, Tractor Harrows, Spring-Tooth Harrows, Peg-Tooth Harrows, Orchard Harrows

Planting & Seeding Machines
Corn Planters, Corn Drills, Grain Drills, Broadcast Seeders, Alfalfa & Grass Seed Drills, Fertilizer & Lime Sowers

Haying Machines
Mowers, Tedders, Side Delivery Rakes, Loaders (All Types), Rakes, Combination Side Rakes and Tedders, Sweep Rakes, Stackers, Combination Sweep Rakes and Stackers, Baling Presses, Bunchers

Belt Machines
Ensilage Cutters, Huskers and Shredders, Corn Shellers, Threshers, Hay Presses, Stone Burr Mills

Belt Machines—Cont.
Cream Separators, Feed Grinders

Power Machines
Kerosene Engines, Gasoline Engines, Kerosene Tractors, Motor Trucks, Motor Cultivators

Corn Machines
Planters, Drills, Cultivators, Motor Cultivators, Binders, Pickers, Ensilage Cutters, Shellers, Huskers and Shredders

Dairy Equipment
Cream Separators (Hand), Cream Separators (Belted), Kerosene Engines, Gasoline Engines, Motor Trucks

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

GILBERT ROCHE,
3-5 First St., Sheldon Block, San Francisco, California.

Household Department

THE HOUSE INSIDE

I have a house inside of me;
A house that people never see;
It has a door though which none pass
And windows, but they're not of glass.

"Where do you live?" ask folks I meet,
And then I say "on such a street;"
But still I know what's really me,
Lives in a house folks never see.

Sometimes I like to go inside
And hide and hide, and hide and hide;
And "doctor up" my wounded pride
When I've been "treated rough" outside.

And sometimes when I've been to blame
I go indoors and blush for shame;
And get my mind in better frame,
And get my tongue and temper tame.

I meet my Heavenly Father there;
For he stoops down to hear my prayer
To smooth my brow and cure my care
And make me brave to do and dare.

Then, after I have been made strong,
And have things right, that were all wrong
I come outside, where I belong
To sing a new and happy song.

Then I can hear the people say
"You're bright and bonnie, good and gay"
And it's because I feel that way;
But they don't know the price I pay.

You have a house inside of you
Where you may fight your battles, too
And God will tell you what to do
And make your heart both kind and true.

S. W. G.

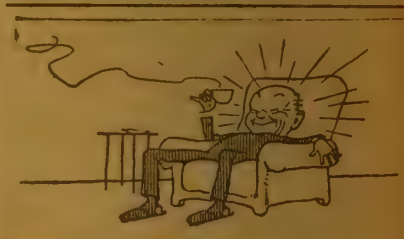
THE REPUBLIC OF POLAND

By John Sobieski in The Golden West

AT THE beginning of the world war, perhaps there was no country of Europe so little known as Poland. I found that even among the reading public their conception was all wrong. The general idea was that Poland was a very small country, about like Serbia, Montenegro or others of the Balkan states, which fell an easy prey to their powerful neighbors. Many times where I have lectured on Poland has the chairman of my meeting, when introducing me, spoken sympathetically of "little Poland."

The fact is, that Poland was not little in anything that went to make up a powerful nation. In territory Poland was nearly twice as large as either England or France. On the great map of Europe we see that by drawing a line from Riga on the Baltic Sea to Dresden in Saxony, another line from Dresden to the mouth of the Dneister River on the Black Sea, and another from the Dneister to Smolensk, Russia, we have enclosed the commonwealth of Poland at its greatest extent. Before the partition, Posen, West Prussia, Galicia, Lithuania, Volhynia, Padolia and Kiev were Polish. Even as late as 1717, Danzig was a Polish seaport. Thus you can see what was the extent of this powerful republic prior to 1572.

Poland was an hereditary monarchy. One dynasty had long reigned in that country; but when it became necessary to either choose a new reigning house or change their form of government, they chose the latter as the less difficult of the two, and more agreeable to the feeling of the nobility. The republic was founded with a written constitution; the first written constitution that we have any account of in history, and it was many years before another was written, which was done in 1789.



There is nothing that speaks more clearly for the character of the Polish people than this constitution. It provided that the chief officer of the republic should be styled the king and that he should be elected for life. And yet the diet could declare the throne vacant at any time and elect another without the formality of impeachment. But in the 200 years that the republic of Poland existed, they never used this power, though there were several times when they would have been justified, and for the good of the republic they should have done so. The greatest mistake made in this new constitution was that it permitted foreign princes to be elected to the throne, and this they did in most cases, which I believe, contributed more than anything else, to the final overthrow of the republic.

The nobility constituting the electoral body of the republic was the largest class of nobility in Europe, numbering about 300,000, and all nobles had the right of elective franchise. There were cases where women had the titles of nobles and the right to vote also. This was woman suffrage more than 400 years ago. So Poland has the distinction of being the first democracy of modern times. Under the constitution there were two chambers of the Diet and as in the election of a king, the members had to be chosen by a unanimous vote and all laws had to be passed by unanimous vote. The king did not have the right to veto and there was no supreme court to pass upon the constitutionality of the laws, as in this country.

The constitution provided absolute religious liberty. Jew or Gentile, Catholic or Protestant, Mohammedan or infidel, all had religious liberty and equal rights. And during the 200 years that the republic existed, no one ever suffered on account of his religious convictions. So Poland was the first country that we have any account of in modern or ancient times, where people were blessed with this privilege. And when we consider the age in which this constitution was adopted, and the fact that in the whole outside world religious liberty was unknown, it seems most remarkable, and it adds greatly to the glory of Poland.

Another remarkable article of their constitution was that prohibiting wars of conquest, wherein they declared that the arms of the republic should never engage except for two purposes: defense of the republic when assailed by foreign foe, and in defense of the Christian religion against the Mohammedan hordes that were constantly threatening the Christian world with invasion.

Another reason why Poland was probably so little known to the people of this day is that nations are known by their wars more than by anything else. Poland seldom, if ever, warred against Western Europe. Her wars were principally with the Turks that were threatening Christendom. For 200 years Poland stood like a wall of fire, protecting the Christian

Do you know the comfort, cheer and after-glow of fine tea?

There is no other drink like it; it gently stimulates and cheers, but makes no demand upon the digestion.

It is a royal drink, and yet, next to water, is the cheapest of all—⅓ cent for a cup of fine rich-flavored invigorating satisfying tea!

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan; Ceylon - India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

world against the fierce and fanatical Turks—never asking or receiving any compensation whatsoever for all of this sacrifice to save the nations. And Poland stood in the fight until the last mighty attempt that the Mohammedans made to conquer the Christian world, when with an army of half a million they marched triumphantly to the walls of Vienna. The whole Christian world was in dismay. It was there that Poland's great King John the Third, with his Christian army of 70,000 met them and dealt them such a crushing blow that it ended forever any further attempt to conquer the Christian world.

(Continued next week.)

JELLY MAKING WITH THE GUESSING LEFT OUT

This is the method for jelly making recommended by W. V. Cruess of the State University. Simple directions are given for making exact tests of acidity, pectin content, time of cooking, etc. Surely the resultant product will be no better than "mother's jelly," but some wasted fruit, wasted effort, wasted time and wasted nerves may be conserved. Try it.

Boiling the Fruit

Boil the fruit until tender (cut and sliced if hard) with just enough water to prevent scorching. Strain off the juice and press the pulp in a coarse bag. Keep the pressed juice separate.

Clearing the Juice

Filter through a jelly bag. The pulp from red currants and sometimes crabapples and loganberries contains an excess of pectin and can be reboiled with a little water, strained and mixed with the first juice. It will have less flavor and acid.

Testing for Pectin

To a teaspoon of juice add an equal quantity of 95 per cent alcohol. Mix and allow to stand. It should form a thin jelly. If it does not, add some crabapple juice or other juice rich in pectin until a good test can be obtained.

Test Acidity

Compare the taste of the juice with a lemonade made of one teaspoon of lemon juice with nine teaspoons of water. If less acid add lemon juice or other sour fruit juice.

Addition of Sugar

Add one cup of sugar to each cup of juice and boil down until the Baume tester shows 30 degrees or a thermometer in the boiling juice shows 220 degrees Fahrenheit or until it will thicken quickly on a cold spoon. If the fruit is poor in pectin use only from one-half to three-fourths of a cup of sugar to each cup of juice.

Pouring into Glasses and Sealing.

Pour into jelly glasses with care not to wet the glass above the jelly. When set, cover with hot melted paraffin. Exposure to the sun before covering will assist jellying.

JELLIES AND JAMS FROM THE EARLY FRUITS

Currant Jelly

Free currants from leaves and stems. Mash with wooden masher. Add one pint water to every 10 pints fruit. Heat slowly to boiling point. Pour into large flannel bag, suspended over stone jar. Let drip, for fine jellies; squeeze gently, if an "every day" product is wanted. Measure out two pints, add two pints sugar. Boil and skim three times. It ought then to drop in heavy drops from spoon, and is done. Pour into hot glasses, set in sun, cover with glass if possible. When cold, cover thickly with melted paraffin.

Raspberry and Blackberry Jelly

Either red or black raspberries will make a soft jelly alone, but if a firm jelly is wanted, use half as much currant (or apple) juice as berry juice. Follow directions for currant jelly.

For blackberry jelly, use berries about half ripe, adding only two-thirds as much sugar as juice.

Strawberry Jelly

Equal parts strawberry and currant juice; boil hard 15 minutes. Follow directions for currant jelly.

Crabapple Jelly

Add four quarts water to eight of chopped, unpared crabapple. Cook slowly till done, strain, as you do currants. You should have but three quarts of juice. Use equal parts of sugar and juice, and boil rapidly. Very easy to "jell." Pale yellow or pink in color.

Gooseberry Jelly

Use large, green berries, proceeding as for currant jelly. It makes a pale green, tart jelly that is fine to serve with meats.

Dewberry Jelly

Pick over the berries, wash and drain. Mash a few in the bottom of the preserving kettle, using a wooden potato masher. Continue until all the berries are mashed; cook for a few minutes, strain through a coarse strainer, then through a jelly bag. Measure the juice and allow an equal quantity of sugar, bring the juice to the boiling point and boil for five minutes; heat the sugar very hot, add it to the juice and boil again; about three minutes will be required. The jelly may be tested by putting a spoonful in a saucer. As soon as a thin skin is formed on the top it is done; remember what is in the ketle is cooking all the time, so try it frequently.

Plum Jelly

Wash the plums and turn into a smooth enameled kettle. Add about one cup of water to each gallon of plums, just enough to prevent the plums sticking to the botom of the kettle. Cook for 20 minutes, lifting those at the botom so that they all may be cooked. When all the skins are broken and the juice runs freely, turn into a jelly bag and drain for several hours or over night. Measure and allow one-half pint of sugar for each pint of juice, for very acid fruit allow an equal quantity. Put the sugar to heat in a shallow pan in a moderate oven. Put the juice over the fire, bring to the boiling point and cook for ten minutes. Add the hot sugar, stir until dissolved. Test as in making dewberry jelly, pour into hot sterilized glasses and seal immediately.

Strawberry Jam

Pick over berries, remove the stems and hulls, wash and drain; weigh and allow three-fourths pound of sugar to every pound of fruit. Mash a few of the berries in the bottom of the kettle, continue till all are mashed, add sugar which has been heated, place over a moderate heat and cook gently for three-quarters or one hour. Turn into hot sterilized glasses and seal at once.

Strawberry Jam

Measure equal quantities of strawberries, chopped pieplant and sugar. Boil very rapidly for 15 minutes, (cook two pints only at a time). Pour into hot glasses, or small cans, as you do jelly. This is fine.

Currant or Raspberry Jam

I often use the unsqueezed pulp from jelly bag for this. Add as much sugar as pulp, and cook as you do strawberry. If a juicier jam is wanted, mash currants, add sugar and cook fast for 15 minutes.

For raspberry jam, proceed as for currant jam.

Blackberry Jam

Measure equal quantities of berries, chopped early apples and sugar. Proceed as for strawberry jam.

Cherry Jam

To one pint stoned cherries add one pint sugar. Mash well together and boil 15 minutes. Delicious.

ESSEX MOTORS DETROIT U.S.A.

Just You Ride

More Than Half a Million Motorists Now Praise It

In An Essex

No other proof is needed to win you to it.

Thousands have placed their orders upon the demonstration revealed in a short ride.

Its performance is so convincing that one is not left with indecision as to its value.

Consider What Thousands Say

On every hand you hear praise for the Essex.

Its newness created an interest that sent hundreds of thousands to Essex stores to see it. On the first day more than 5,000 rode and were won by its performance.

Every day of the past four months has seen a swelling tide of admiration until now all are saying the finest things for it.

What Is It That They Admire?

Is it performance or appearance—low cost or economy of operation?

One speaks of one quality, another of some other feature.

That is accounted for by the experience those persons have had with other cars.

The man who has owned a good light weight car recognizes in the Essex a wider power range. He sees a complete car. It has features he had never hoped to obtain in any car selling within his price range.

The man experienced with fine cars sees in the Essex an equal quality to that with which he is accustomed but at an immense saving in operating and maintenance cost.

It Has Appealed To All Motorists

Interest in the Essex has come from all classes of motorists.

That proves the fulfilment of the aim of its builders. They intended it should be the car that would embody all the advantages of the two accepted types of cars.

It should have lightness as well as durability—performance as well as low first cost—easy riding qualities as well as economy of operation.

They did not sacrifice the advantages of either—they combined them.

That is what all have recognized.

It is what we want you to know and thus our statement "Just you ride in an Essex."

Dairy exchange prices last week on extras:

June	11	12	13	14	16	17
'19 ...	47	..	47	47	..	48

POULTRY

Prices to producers: Hens, 26@28; broilers, 23; fryers, 30; roasters, 35; old roosters, 14; capons, 42; ducks, 27; ducklings, 27@29; geese, 25; turkeys, 35@40; squabs, 45.
Belgian hares, 15.

LIVE STOCK

Hog producers and feeders of the lower San Joaquin Valley are of the opinion that the Los Angeles market is aways out of line with Eastern markets. They base their opinion on the prices being paid for hogs locally in comparison with those ruling in Chicago, Kansas City and Omaha. Prices received by them range from $16.50 to $17.30 f. o .b. Visalia and adjacent points, while the market for hogs in the Eastern cities ranges from $19.25 to $21.15 f. o. b. stock yards. Quite a number of reasons existing in the East for their high prices do not exist here. Export orders for not only hams and bacon but also mess pork and a large outlet at high prices for trimmings and offal in Eastern centers does not exist here. A large percentage of all hogs dressed in this city are sold in wholesale cuts. The loins, legs, bellies and butts find a ready outlet but all other cuts are disposed of at forced sale from 5 to 8 cents per pound under prices received by the Eastern wholesalers.

The local outlet is so limited that the live prices of hogs will have to go even lower than at present if it is desired to increase consumption. When prices reach their present level consumers curtail their purchases. The local market for beef cattle is very weak and is oversupplied.

Lambs of good quality are strong with a higher tendency. Sheep remain steady but the demand is very dull.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Cattle:
Good steers .....10.00@11.00
Medium steers .....9.50@10.00
Common steers .....8.00@9.00
Good cows .....8.00@8.50
Medium cows .....7.00@8.00
Common cows .....5.00@6.50
Hogs No. 1, 175-225 lbs. .....18.50@19.00
Hogs No. 2, all other weights..17.00@17.50
Sheep:
Lambs No. 1, 55 to 75 lbs.....15.00@16.00
Lambs No. 2, 65 to 80 lbs ....12.50@13.00
Wethers .....9.00@9.50
Ewes No. 1 .....8.00@9.00

POTATOES AND ONIONS

These are the actual prices obtained June 17, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Potatoes: No carlot arrivals. Demand and movement moderate, market firm, no change in prices. Carlot sales to jobbers—closing prices Monday: California Burbanks, best, mostly 2.50. Sales to retailers: New stock, California lug boxes, White Rose 1.00@1.15.

Sweet potatoes: Lug, 1.00@1.10.

Onions: Demand and movement moderate: New crop, homegrown green onions, 35 doz., small bunches; Imperial Valley and Coachella Valley, Wax and Yellow Bermudas, standard crates, best 3.25@3.75; poorer 3.00 up. Stockton, Red Weathersfield, 4.50@5.00; Yellows, 5.00@6.00.

VEGETABLES

These are the actual prices obtained June 17, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Asparagus: Northern, green, local fancy, 14@15; fancy, 11@12.
Beans: Kentucky Wonder, best 9@9½.
Beets, doz. bunches, 25@30.
Carrots, doz., 50.
Cucumbers, Signal Hill, 14 pound box, 1.40@1.60; lug 2.00@2.50.
Celery, cr., 5.50.
Corn, sweet, doz., 1.25.
Eggplant, lb., 13@14.
Lettuce: Sales to retailers, best lettuce in cabbage crates, 75@85.
Parsley, doz., 15.
Peas: Local (San Pedro) best, 10@12.
Radishes: Round Red 20 per dozen bunches. Long White, 40 per dozen bunches. Long Red 20 per dozen bunches.
Rhubarb: Local Giant Cherry, 1.25@1.50 per packed box. Strawberry, fancy 1.00@1.35 apple box.
Spinach, doz., 20.
Squash: Local summer, lug 75.
Tomatoes: Quality and condition generally fair. Coachella and Imperial Valley, 4 basket crates, best 1.25@1.35; poorer 80 up.
Turnips, doz., 30@40.

FRUITS

These are the actual prices obtained June 17, by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: Yellow Newtons, fy. medium size, 4.50@5.00; loose, 9@11 lb. Oak Glen, Rome Beauties and Pearmains, 3.75@4.00.
Apricots: Bulk in lug boxes, 45.
Blackberries: Cr., 3.00@3.50.
Cantaloupes: Demand and movement good, market steady, little change in prices. Sales to jobbers—green meats, wrapped and unwrapped, standards 45s 1.75@2.00, ponys 45s and 54s 1.50@1.75, flats 12s and 15s 70@75. Considerable green, practically no demand, none being sold.
Brawley: Shipments continue heavy. Few sales—carloads f. o. b. cash track—green meats, wrapped and unwrapped, standards 45s, mostly 1.50@1.60, green meats, wrapped and unwrapped, flats 12s and 15s, special marks, 75@90, mostly 80. Practically all shipments consigned.
Cherries: Black Tartarians, 10@14; Royal Annes, 12@15.
Figs, per 10 lb bx, 1.75@2.00.
Gooseberries, 12@13 lb.
Loganberries, cr., 4.00@4.25.
Raspberries, cr., 3.00@3.50.
Peaches: Alexander, 10 lb.
Pineapple, lb., 18@20.
Plums: Climax, lb., 5@7.
Strawberries, cr., 3.50@4.50.
Watermelons: Imp., lb., 1½.
Brawley: Haulings increasing. Quality and condition good. Carloads f. o. b. usual terms. Excell, bulk per ton 19.00@20.00; Angelenos, 18.00@19.00.
Lemons: Fancy packed, 6.25@6.70; local pack, 4.00@4.50; loose, some tree ripe, 3.00@4.0.
Oranges: Valencias, medium fancy, 5.50; local pack, 4.00@4.50.
Grapefruit: Local fy., 3.50@4.00 bx.; poorer, 2.00@2.50.

BEANS

Demand and movement moderate, market firm, little change in prices. Carloads f. o. b. usual terms—pool prices, choice, recleaned basis, Limas 9.00, Henderson Bush 7.50. Warehouse cash to growers—choice, recleaned basis, Small Whites 6.40@6.50, Large White, mostly 6.25, Blackeye 3.75@4.00, Tepary 2.25@2.50.

HONEY

Few sales. Orange honey crop about 28 cars, alfalfa honey in Imperial, large crop as also sage and mountain honey in San Diego County. Small lots selling to retailers at 20@24 cents for prime white extracted, comb white 6.50@7.00 per case. The Exchange reports advance orders for several carloads.

INTERNATIONAL DEHYDRATOR 5 TON UNIT
(IMPROVED TYPE)

Apricots, Prunes, Peaches, Grapes and Vegetables
Tons Will Be Saved This Year by the

International Dehydration Machine

Every FRUIT and VEGETABLE GROWER and all CANNERIES should use this approved method without delay. The establishment of an International Dehydrator in any community is a mark of progressive distinction. "Fifty-four per cent. (U. S. Government Report) of vegetables and fruits that come to maturity are lost."

This machine is not a "toy" nor a "hot box." It is a real commercial proposition. We completely guarantee the perfectness of our equipment.

GRAIN AND FEEDS

Barley, (1918 crop): Feed, 2.55@2.60 per cental; shipping, 2.65@2.70 f. o. b. Port Costa; new feed, 2.45@2.50.

Oats: Red feed, 2.20@2.40 per cental.

Corn: California yellow, 3.15@3.40 per cental. Egyptian, 2.75@3.25; Milo maize, 2.50@3.00.

Rye: 3.65@3.75.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of June 14, Scott, Magner & Miller says:

Receipts past week 1203 tons; about the average maintained for some weeks. A good part of this has has been of the new crop, both first cutting alfalfa and volunteer oat containing more or less clover together with some good No. 1 wheat hay which has been arriving from the San Joaquin and Antioch sections. This latter grade of hay has found ready sale for the reason that it is good length and color and the bales are light. Alfalfa seems to be doing better than most other grades owing to the fact that a great deal of it is being ground into meal and milling companies have been buying their requirements to keep the machines going. As high as $12 in the stack has been paid for this purpose.

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	19.00@21.00
No. 1 Wheat or Wheat and Oat Hay	16.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	17.00@19.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	11.00@14.00
Barley Hay	11.00@14.00
Alfalfa Hay	15.00@19.00
Stock Hay	11.00@13.00
New first cutting Alfalfa, in order	10.00@13.00
No. 1 Barley straw, bale	.50@80

Citrus Markets

Los Angeles, June 18, 1919.

The liberal shipping of a couple weeks ago tended to somewhat demoralize the market. There has been a slight recovery, however, some sales of Valencias reaching the $7.00 mark but a vast number going nearer the $3.00 mark. There has been great diversity in quality, poor keepers commanding extremely low prices.

Lemons are not meeting with the long prices of last week as the weather has materially modified. The market is, however, in fine condition.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 25,221 cars, lemons 6580, total 31,801. To same date last season; oranges 11,105, lemons 3591, total 14,696. Central California this season; oranges 4394, lemons 354, total 4748. Last season to same date; oranges 2527, lemons 115, total 2642. Northern California; oranges 244, lemons 2; last year same date oranges 202.

"To Have and to Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

Manufactured by
McQuay-Norris Manufac uring Company
Locust St. St. Louis, U. S. A.

McQUAY-NORRIS
Superoyl
RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris Leak-Proof Rings in lower grooves to insure maximum compression and fuel economy.

3-12F D

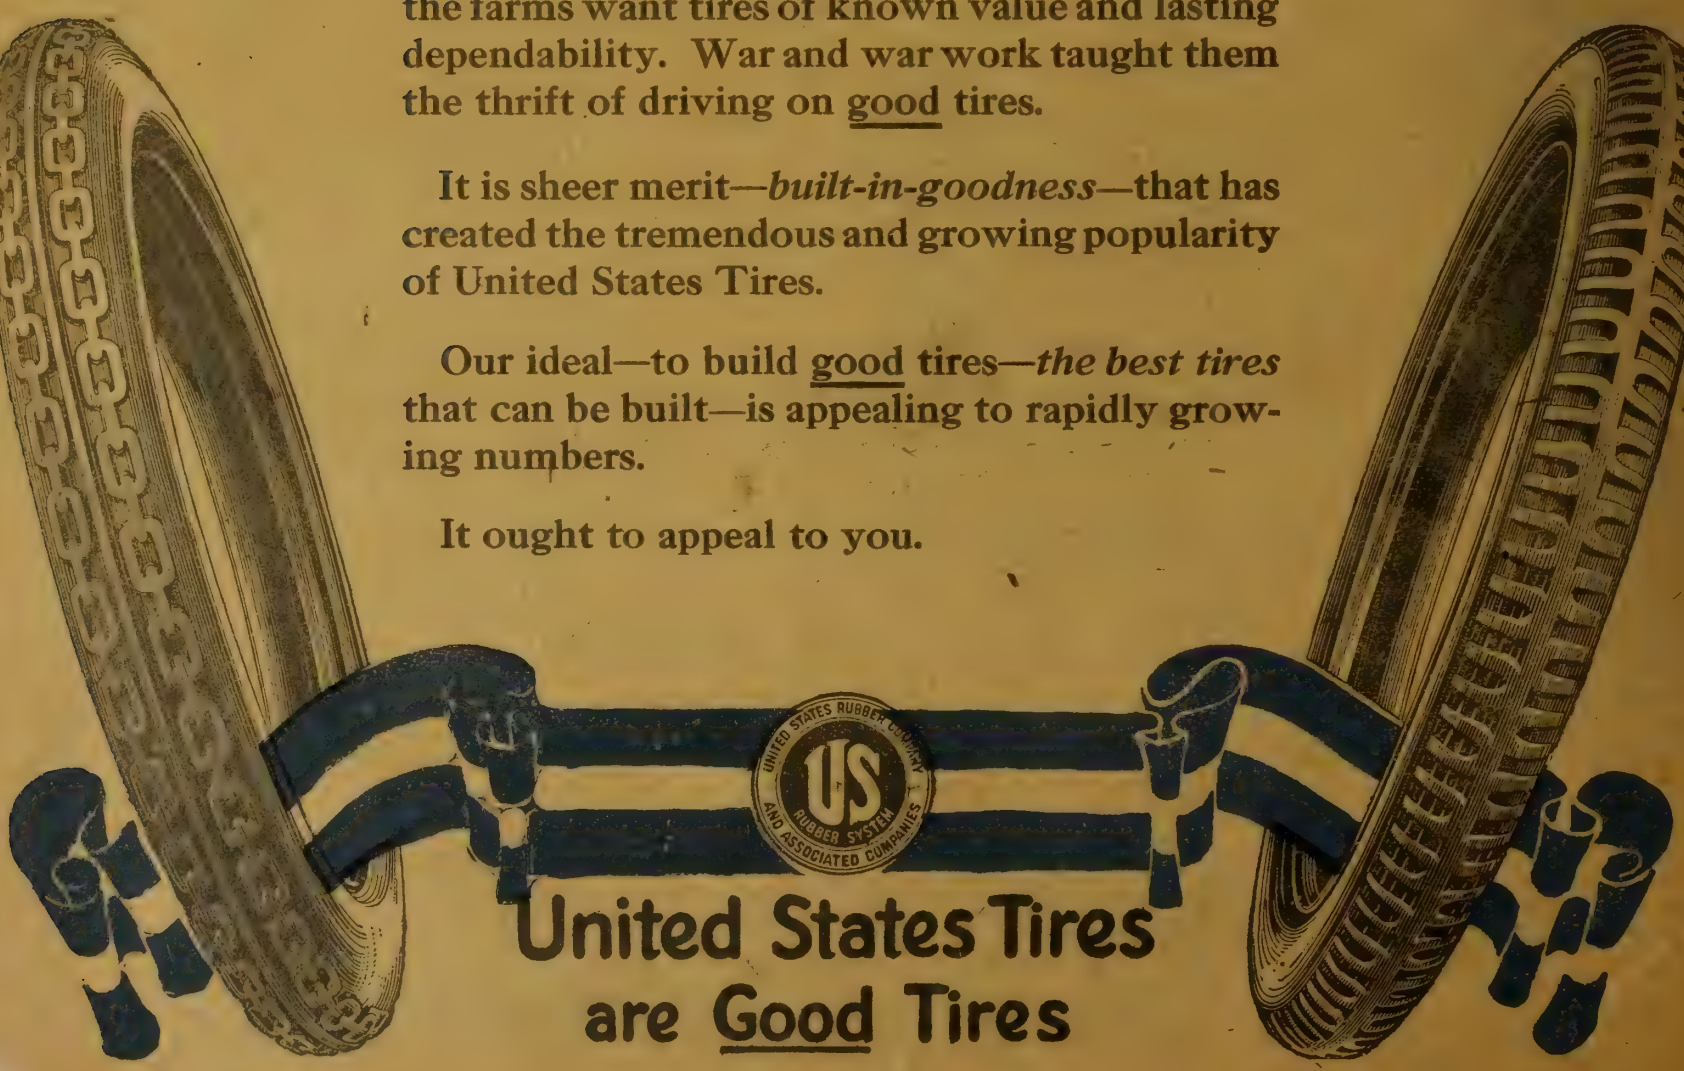
Next Time You're In Town—

—notice the number of cars you see equipped with United States Tires.

You'll find the proportion surprisingly large.

And if you were to look at the cars on Fifth Avenue, New York, Michigan Boulevard, Chicago, or other fashionable thoroughfares, you'd find the same preponderance there.

'Chain'



'Usco'

Everyone—folks in the cities, villages or on the farms want tires of known value and lasting dependability. War and war work taught them the thrift of driving on good tires.

It is sheer merit—*built-in-goodness*—that has created the tremendous and growing popularity of United States Tires.

Our ideal—to build good tires—*the best tires* that can be built—is appealing to rapidly growing numbers.

It ought to appeal to you.

United States Tires are Good Tires

$26,000 Worth of Holsteins

Agricultural News Notes of the Pacific Coast

Northern California

Oroville, Butte County, is shipping liberally of plums.

Yolo County is contemplating the planting of ramie and other fiber plants.

Sacramento County shipped approximately 150,000 carloads of strawberries this season.

One sugar beet producer in West Sacramento averaged something over a ton of seed per acre.

The recent sale of the stock and implements of the Vina Ranch brought exceedingly low prices.

It is now estimated that California's output of fresh deciduous fruits will be about 25,000 carloads.

Redding, Shasta County, farm center voted unanimously in favor of repealing the daylight saving law.

One Butte County hog grower recently made a shipment of hogs netting him $4,000, an average of $74 per hog.

The Sacramento Valley's wheat crop is said to report a better average of condition than any other section of the state.

Oroville is planning to make a concerted fight on citrus blast, a serious disease of orange and lemon trees in that county.

The state land colony at Durham, Butte County, is planning for a fair and live stock sale to be held some time this fall.

"Fight the hoppers" is the slogan of grain grower, vineyardist, gardener, in fact almost every producer of the Sacramento Valley.

The poultry school recently held by the department of agriculture at Grass Valley, Nevada County, was attended by about 100 poultry people.

Nearly all farm bureaus in the Sacramento Valley have heartily endorsed the $40,000,000 good road bonds which will be voted upon July 1.

Colusa County Bartlett pear growers have contracted much of their coming output at $85 per ton. Best of canning apricots command around $110.

Chico chamber of commerce is working for an irrigation project covering a portion of the northern part of Butte and southern part of Tehama County.

The coming season's crop of Tokays in Lodi, San Joaquin County, will be handled through 22 great packing houses. The best prices yet obtained have been around $40.

Ranchers of Eldorado County are appealing for more water. It is said that about 6,000 acres have been signed up in an effort to form a Wright irrigation district.

The United States food administration through its grain corporation has granted an increased allowance to grain producers on sacks from three and one-half to four and one-half cents per bushel. It is stated that this will save California farmers $200,000.

California Fish and Game Commission has installed sets of compact nature study libraries at the Tahoe national forest. The libraries include books on birds, wild flowers, trees, and kindred subjects. The books were donated by the California Nature Study League.

Central California

Merced reports the grasshopper pest under control.

The bean crop of the valley is moving very rapidly.

1919 Muscat grapes are commanding around 10 cents.

Dried apricots have been quoted as high as 28 cents to the grower.

Merced County is making a fight against disease bearing mosquitoes.

The Tulare County citrus section reports transfer of many citrus groves.

Tulare is planning for one of the best equipped cooperative canneries of the state.

Lodi is overhauling Tokay packing houses and preparing for record crops and record prices.

Stanislaus County farm bureau holds fat lamb auction at Modesto Friday this week.

Paso Robles orchards are being defoliated by grasshoppers, and an organized fight is being put up.

Lodi grape growers are appealing for a supply of at least 75 cars a day during grape shipping season.

Growers of Oakdale, Stanislaus County, have harvested practically all their small fruits and cherries.

The weather has been so cool this season that apricot drying has not proceeded as satisfactorily as usual.

Tulare Lake bottom will grow fortunes for wheat growers this year. Some of the fields are averaging 20 sacks per acre.

The coming output of raisins will be the largest in the history of the industry. It is expected to reach at least 200,000 tons.

The San Jose Grange Patrons of Husbandry has decided against affiliating with the recently organized national farm movement.

Tulare County Cantaloupe Growers Association, with headquarters at Porterville, reports fruit maturing very rapidly despite low temperatures.

Merced County is having a fight between those who are working for an irrigation district and another faction endeavoring to block the advancement.

Oakdale, Stanislaus County, Almond Exchange has elected the following officers: C. C. Turner, president; William Minney, secretary, and W. A. Tucker, vice president.

Veterinarians have given warning to some cattle owners to be careful in pasturing stock on lush young Johnson grass, as it is claimed it sometimes contains a poison.

A recent election of the California Peach Growers resulted in the selection of the following directors: F. H. Wilson, Chris. Jorgensen, John Rordan, Warren A. Wood, C. A. Rice, W. J. Wilson, J. F. Niswander, Ward A. Minturn, H. P. Bowman.

San Francisco consumers and merchants have declared a boycott on strawberries because of the high price. One of the daily papers is egging the matter on and suggesting placards stating that fresh strawberries are not served. Perhaps the strawberry growers will be content to wear less of city-made clothing and some other things the profits from which are dear to the hearts of the urban folks.

Southern California

Orange County is growing beet seed.

Limas have not yet reached 10 cents, but it is promised.

The hot days around June 1 have caused a drop of many little oranges.

Farm bureaus of San Diego County are discussing the holding of a county fair.

Stock is now all subscribed for the date packing house to be erected at Indio.

Some walnut growers think the coming year's output will pass 25,000 tons.

Brawley, Imperial County, recently shipped a carload of cantaloupes to Havana, Cuba.

Experimental plantings of pineapples have been made in the Imperial Valley and very successful results secured.

The sorghum mill at Pomona is planning for a larger run than last year. A new two-ton press is being installed.

Riverside-San Bernardino Counties Cow Testing Association reports its banner cow for May as producing 69.70 pounds of fat.

The Automobile Club of Southern California is putting out signs giving warnings as to fire danger in grain fields as well as in forests.

Farmers at La Verne, Los Angeles County, are proposing the construction of a dam across Live Oak Canyon for storing flood waters.

Riverside County fire warden is again on the job. A great reduction in grain fires is reported as a result of the warden's work last year.

A Palo Verde Valley farmer is proud of an experimental acre of sugar beets which he maintains will show close to 30 tons per acre.

It is estimated that the "peak" of the Colorado flood will be reached about July 5. No trouble is expected by Imperial and Yuma farmers.

The farm bureaus are discussing as to possibilities of a state-wide postcard ballot to secure the wish of the members on various agricultural questions.

The San Bernardino County board of supervisors has recently ordered the road supervisor to clean and improve wells and springs along desert highways.

An effort is being made in Riverside, San Bernardino and Orange Counties to create a mosquito abatement district to cover the entire valley of the Santa Ana River.

Airplanes from March Field are now patrolling the mountains from Lake Hemet to Cahuilla twice daily. Machines from the San Diego field cover the mountain districts south and west of this section.

Citrus growers at Rialto, San Bernardino County, are making a campaign to protect themselves from automobile thieving parties; also against the citrus packing houses dumping culls in conspicuous "washes".

The California Walnut Growers Association is receiving hundreds of inquiries as to the terms of its contest for $10,000 offered for the perfection of a walnut branding device. All entries in this contest must be in hand by July 1.

The Coast and General

Canadian capitalists are making paper from banana leaves in Mexico.

Alfalfa hay is selling for $14 per ton, wheat $3.38 per hundred, barley $2.50.

Farmers at Salmon, Idaho, are raising a thousand acres of peas for canning.

A $5,000,000 beet sugar manufacturing company has been organized in Japan.

Oregon's promise of a big apple crop is inducing building of much larger storage facilities.

Missouri state poultry show is to be held at Sedalia, August 9-16 in connection with the state fair.

The Nevada Live Stock Association is favorable to government regulation of grazing and public ranges.

The wheat crop in Arizona is estimated to be 1,000,000 bushels, probably the heaviest yield for many years.

A new cotton oil mill is to be built this season at Phoenix. This will make three in the Salt River Valley, Arizona.

Lane County, Oregon, is producing a large quantity of rye. It is a favorite for pasturage with dairy people of that section.

Fire in a hay warehouse at Peoria, Arizona, on June 10 destroyed hay valued at $6000 and a carload of wheat valued at $3000.

One county in Oregon produces about 2,000,000 pounds of prunes which have been contracted for this year at around 16 cents.

New York apple growers are compelled to pay 65 cents per barrel for their cooperage. This, however, is 20 cents under last year's contract.

A strike of linemen on the Roosevelt power plant has temporarily curtailed power derived from the water from the Roosevelt Dam, Arizona.

The Oregon voters have indorsed an increased tax levy for good roads building and also contemplate a $10,000,000 good roads bond election.

An effort is being made in Oregon to merge all of the fruit growers county and state cooperative organizations into one state association.

Wenatchee Valley, Washington, production of apples this year will run about 8,700 carloads. This is about five per cent increase over last year.

Georgia has planted more largely to pecans this year than formerly. The growing of this nut is becoming a great business in some sections of the South.

The school census of Maricopa County, Arizona, shows an increase of more than 2000 over the census figures of 1918. The population of Phoenix, the capital city, has increased nearly three times since the census of 1910.

The new commission of agriculture and horticulture of Arizona, conforming to the law passed by the last legislature, is composed of A. Kimball of Graham County, who is a member of the old commission; E. W. Hudson of Maricopa County, who has done more to develop the long staple cotton probably than any other one man; and A. Y. Greer of Yuma County, an old time resident and cotton man. This commission will meet at Phoenix very shortly for organization and appointment of the officials of the commission for the ensuing year.

Information for the New Exhibitor

By R. P. Royce

FROM all parts of the state reports indicate that there is more interest being manifested in the fall shows and fairs by live stock breeders than ever before, and many men will exhibit for the first time. Such being the case it might be well to outline in a general way the usual classification adopted by shows and fairs and to offer some hints and suggestions to the beginners—and to remind some of the older exhibitors that they can save themselves much time and money and in some cases loss by paying careful attention to details.

The importance of live stock shows is too generally recognized to require any argument from the writer. Suffice it to say that exhibiting at county, state and district fairs is one of the most valuable methods of attracting the attention of the public to one's productions—it is a method of publicity that no breeder can afford to overlook. Not only will he derive much benefit from such publicity, but any breeder—even the oldest—can not fail to learn a great deal not only as regards the other fellow's stock but of his own as well. The man who does not make a practice of exhibiting or attending shows is very apt to get an entirely too high opinion of the value of his herd or flock. A real show with stiff competition is about as effective a cure for conceit as can be called to mind.

Practically all shows and fairs of importance have adopted the standard classification recommended by the American Association of Fairs and Expositions.

The basis of classification is the separation of breeds and competition within the breed divided on the basis of sex and age. Only in the group classes do males and females appear in the same ring. Inter-breed competition does not occur except at the most provincial shows and in the fat classes —steers, wethers, barrows, etc. — at the larger shows. Animals eligible to show in breeding classes do not come into competition with other breeds.

Animals eligible to compete in the various classes at a show of importance must of course be registered pure breds.

In making entries for showing the breeder should write to the secretary of the fair for a premium list and proper entry blanks. The premium list gives the classifications offered, the breeds recognized and the rules and regulations of the association holding the fair or show.

With these in hand, and a knowledge of the animals one intends to show proper entries can be made.

The standard classification for beef cattle is:

1. Aged bull.
2. Two year old bull.
3. Senior yearling bull.
4. Junior yearling bull.
5. Senior bull calf.
6. Junior bull calf.
7. Aged cow.
8. Two year old heifer.
9. Senior yearling heifer.
10. Junior yearling heifer.
11. Senior heifer calf.
12. Junior heifer calf.
13. Senior champion bull.
14. Junior champion bull.
15. Grand champion bull.
16. Senior champion female.
17. Junior champion female
18. Grand champion female.
19. Aged herd.
20. Young herd.
21. Calf herd.
22. Get of sire.
23. Produce of dam.

For dairy cattle the same classification is commonly used, although many fairs, our state fair included, add an additional class for cows "four years old or over."

For swine the classification is:

1. Aged boar.
2. Senior yearling boar.
3. Junior yearling boar.
4. Senior boar pig.
5. Junior boar pig.
6. Aged sow.
7. Senior yearling sow.
8. Junior yearling sow.
9. Senior sow pig.
10. Junior sow pig.
11. Senior champion boar.
12. Junior champion boar.
13. Grand champion boar.
14. Senior champion sow.
15. Junior champion sow.
16. Grand champion sow.
17. Aged herd.
18. Young herd.
19. Herd bred by exhibitor.
20. Get of sire.
21. Produce of dam.

For draft horses the usual classification is:

1. Aged stallion (five years old or over; this class used at large Eastern shows).
2. Stallion, four years old or over.
3. Stallion, three years old and under four.
4. Stallion, two years old and under three.
5. Stallion, one year old and under two.
6. Stallion foals.
7. Aged mare (same as number 1 above).
8. Mare, four years old or over.
9. Mare, three years old and under four.
10. Filly, two years old and under three.
11. Filly, one year old and under two.
12. Filly foal.
13. Senior champion stallion.
14. Junior champion stallion.
15. Grand champion stallion.
17. Senior champion mare.
18. Junior champion mare.
19. Grand champion mare.
20. Get of sire.
21. Produce of dam.

Sheep are classified as medium wool, long wool and fine wool, and the following classification is most common:

1. Aged ram.
2. Ram, one year old and under two.
3. Ram lamb.
4. Aged ewe.
5. Ewe, one year old and under two.
6. Ewe lamb.
7. Champion ram.
8. Champion ewe.
9. Pen of four lambs bred by exhibitor.
10. Pen of four lambs get of one sire.
11. Flock, one ram, any age; two ewes, one year old and under two; two ewes under one year.

As stated above the classifications are based on ages and for the purpose of computing ages certain "base dates" are used. The base dates for the beef breeds are January first for juniors and September first for seniors. In other words an aged bull or cow must be three years old or over on Setpember first of the year in which she is shown. A two year old bull or heifer must be two years old and under three on September first of the year shown. A senior yearling bull or heifer must have been dropped between September first two years before the show and January first of the year preceding the year of the show. In order to show as a senior yearling this year an animal must have been dropped between September first, 1917, and January first, 1918. A junior yearling bull or heifer to be eligible in class in 1919 must have been dropped between January first, 1918, and September first, 1918. A senior bull or heifer calf for 1919 must have been dropped between September first, 1918, and January first, 1919, and a junior bull or heifer calf must have been dropped since January first, 1919.

The best dates for dairy cattle are February 1 for junior classes and August 1 for senior classes.

For swine the base dates are March 1 for junior classes and September 1 for senior classes.

Horses, mules and sheep all have January 1 as the base date and ages are reckoned from that date.

The group classes for beef and dairy cattle are practically the same at all shows. The aged herd consists of one bull two years old or over, one cow three years old or over, one heifer two years old and under three, one junior yearling or senior yearling heifer and one junior or senior heifer calf. Most fairs require ownership of all at time of entry but do not require that all have been bred by the exhibitor.

The young herd consists of one bull under two years old—either a senior or junior yearling or a senior or junior calf, and two heifers of like ages. Only the heifers need to have been bred by the exhibitor, but both the bull and heifers must be owned by him.

The calf herd is composed of one bull and two heifers, all under one year old and all bred and owned by the exhibitor.

The get of sire class consists of four animals of either sex that are the get of the same sire. The different fairs have different rules regarding this class. Most fairs do not require the exhibitor to own the sire and even permit the owner of the sire to borrow four animals from the owners and compete.

The produce of dam class requires two animals of either sex the produce of the same dam. Various fairs make different rules as to the necessity for ownership by the exhibitor.

In the swine classification the show management may or may not require that the aged herds and young herds be bred and owned by the exhibitor. In any case an aged herd consists of one boar and three sows all of which must be one year old or over and a young herd consists of a boar and three sows all under one year of age.

The get of sire class consists of four animals of either sex the get of one boar. A fair management may or may not require that all be owned or bred by the exhibitor.

The produce of dam class requires four animals of either sex the produce of one sow. A fair may or may not require ownership of all by exhibitor.

The group classes for horses and sheep depend upon the requirements of the particular show.

In addition to the above classes there are many special classes introduced by various fairs and shows.

Most state fairs provide two classifications for the leading breeds: "open classes" and "state classes." Competition in the first is open to all and in the second is restricted to animals owned in the state. Many of the breed associations offer special prizes and a number of the leading associations sponsor "futurity shows."

Entries must be made in advance in all the "regular" classes and at the time of entry the name, registration number, age, name of sire and dam together with their registration numbers, and the address of the owner must be given.

The same animal can be shown in one individual class and in several of the group classes.

Entries are not required for championship classes as the winners in the individual classes automatically come before the judge for champion rating.

In cattle classes, the first prize aged and the first prize two year old bulls or females are eligible for senior champion. All others compete for junior champion. The grand champions are picked from the senior and junior champions. A fair may or may not give reserve championships — which really is a second to the champions.

In swine the senior champion boar and sow are picked from the winners in the junior yearling, senior yearling and aged classes; the junior champion from the first prize senior and junior boar and sow pig classes. The grand champion is selected from the senior and junior champions.

The championships in the other classes of live stock are arrived at in much the same way.

In addition to the above all fairs have various rules in regard to satisfactory evidence that animals are breeders.

Entries, together with requests for stalls and pens, and the necessary fees should be forwarded to the secretary of the fair or show as early as possible. By early attention to these maters, mistakes can be corrected, good locations and proper cataloging can be secured.

It is always advisable to make more entries than are needed as it very often happens that at the last minute some accident may prevent a particular animal getting to the show. Another point to remember—be sure to take all registration papers.

HOME GROWING OF SEED POTATOES

To hold the cost of potato production at a reasonable figure, department of agriculture officials advocate that greater attention be given by growers to the production of their seed stock. They believe that every grower would derive benefits from giving special attention to the removal of all plants not true to variety, as well as all diseased, weak or abnormal plants from a sufficient number of rows in his field to provide an ample supply from the remaining plants to plant the acreage desired the following year.

For example, the potato specialists say, if the custom is to plant 20 acres to potatoes, it would be necessary to obtain an ample seed stock, to weed undesirable plants from at least two acres. Time required for this work would be comparatively little.

If a large percentage of off type or diseased plants are found to exist in a field, tubers from it should not be retained for seed purposes unless a better source of seed supply is not available. In that case most careful and painstaking roguing to eliminate, so far as practicable, all mixtures and all diseased plants should be conducted. It will take a larger acreage to supply the necessary seed than will be the case where the stock is relatively pure and disease-free.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

INDEX

Another milestone by the California Cultivator's roadside. Vol. LII is ended. Vol. LIII begins with next issue. Plans are laid for making it the most helpful of all.

A look over the index on pages 878, 879, shows the past volume to contain a vast fund of information on many subjects — mostly practical farmer-made stuff. The answers to queries alone make the volume worth preserving.

File the Cultivator and use the index to answer lots of farm questions.

GOODYEARS TO COAST

The announcement of the erection by the Goodyear Rubber Company of a twenty-five million dollar manufacturing plant at Los Angeles means much to the Pacific Coast. One feature of the plant is a cotton mill which will make use near home of a large quantity of California and Arizona grown cotton—the first in quality in the world.

Now give us more roads that we may "burn up" more good year tires.

GRASSHOPPERS

From nearly every section of the state come reports of raids of the grasshopper hordes. It may be a bit late to make the suggestion, but these pests should have been destroyed last October and November by plowing vacant lands which are usually their breeding places. However, organized fights are now being made in many of the counties of the state. The most successful methods of combating the pest are given on fifth page of this issue.

PEACE

The tearing to shreds of a solemn obligation and considering a treaty between nations a scrap of paper has been punished with awful cost to all the world, but now another treaty has been entered into. It proclaims a peace, the maintenance of which shall not be dependent upon a despot without honor, but one which is to be enforced by a League of Nations, and, in addition, let us all hope it will be a treaty which shall always be honored by all people.

OBSERVE NATION'S BIRTHDAY

The celebration of the birthday of our nation will have deeper meaning this year than any preceding year. A year ago its observation was almost an international affair, but the liberties of the world, for which our Independence Day was observed, have been safeguarded to a far greater extent than we dreamed a year ago. So all the world will this year, even more than last, celebrate with Americans the new liberties and the new peace which has been won.

TAX THE OLIVES

The Oroville chamber of commerce is wiring to olive interests of Southern California asking as to any steps that may be taken to increase the tariff on imported olives. California's olives have won a name for themselves and as a food proposition are so superior to imported olives that this quality alone means a measure of protection, but with the cheaper labor of southern Europe, the "pickles" imported are to an extent a menace to this great California industry. Let the olive growers get together—get busy. The rest of the country won't protect them if they don't want to be protected.

SAVING THE DAYLIGHT

For a little matter of only one hour of time the daylight saving enactment has stirred up a lot of contention. From all we have seen in Eastern papers we think California has, however, been getting off with a minimum of contention in this particular campaign. However, there are those who think California farmers should have put more energy into the fight. The fight, though, is won, so far as congress is concerned, or will be with the expiration of the present summer season, for congress has acted to make the date of the effectiveness of the new law or rather the repeal of the old one, October, next. But, criticizing our former editorial, Hon. George W. Ashley, president of the San Joaquin Table Grape Growers' Association, writes:

I notice your editorial on daylight saving. In it you say that California looks on with indifference. Possibly. I will say, however, that I do not of my personal knowledge know of a farmer in favor of it. On account of the dew it is a nuisance to the grain and bean thresher, and to the table grape grower in picking time it is worse than a nuisance. It costs thousands of dollars to the farmers of every locality.

APRICOTS

California's output of apricots will not reach into the "billions," but it sure will be some crop this season. The labor situation has been a bit strenuous, but with the high prices, prospective or actuallly guaranteed by contracts, the producers have offered wages which have secured liberal response in most sections. Fortunately the ripening season varies sufficiently in the different sections that it is possible to plan for a shifting of labor from one to the other. For instance, interior valleys, Hemet and others of the earliest sections, will soon finish. Orange and Ventura Counties, especially the later, will not begin drying until the 10th, or possibly the middle of July. These sections are asking for harvesters from the earlier ones to "come over and help us." The value of last year's crop was around $8,000,000 from 40,000 acres of bearing orchards. With a crop practically up to normal and prices the highest known, this year's output will exceed last year's many times.

DEMONSTRATE

The tractor is having a discussion with itself as to whether its efficiency may not be better shown by a still exhibit than in competitive or private demonstration. The state fair and, in fact, all the other fairs, are encouraging the still exhibit, and perhaps in those cases where the intense interest which is shown in a real tractor demonstration necessarily detracts from other features of the fair, this is most wise. Also space for satisfactory demonstration is impossible at a fair. There is something fascinating about action and in seeing modern equipment demonstrate its power to do things economically and the crowds follow the dust of demonstrators. Hence for the fair it appears the still exhibit is best.

On the other hand there is great advantage to the would-be purchaser of improved equipment in seeing the expert handling his machines and implements under certain difficulties, and it has been the custom of the tractor demonstrator to pass it up to the would-be purchaser to describe the particular job he has in mind and then to show him how the tractor and its accompanying implements can do that particular job.

Unfortunately, or perhaps more correctly, fortunately, the last two or three demonstrations have been held in fields with extremely intractable soil conditions. We well recall that when the Cultivator camera was endeavoring to get a photograph of a plowing scene in which two men were trying to force the point through adobe so hard that the point was fairly smoking, the dealer appealed to the photographer to "be reasonable and please never show that implement under those trying conditions."

Notwithstanding that and many other such instances these demonstrations have been wonderfully beneficial. Farmers have seen the methods of work and been inspired to perfect the equipment of their farms and dealers have sold many implements because of them. It is barely possible that some would-be buyer may have deferred his purchase until he could become better informed, possibly through private demonstration, but, admitting this, it is only proof of the advantage of these demonstrations.

GOOD ROADS FOR THE FARMER

One of the hardest workers for the success of the good roads bonds which will be voted upon next Tuesday has been the Automobile Club of Southern California. This organization has also had a powerful influence in advancing good roads interests in all parts of California for many years. In its endeavor to secure the best of information as to the value of good roads from every standpoint it has need to look with the eyes of the farmer. The club has asked George P. Clements of the agricultural department of the Los Angeles chamber of commerce to give his estimate of the value to California farmers of California good roads. Mr. Clements writes:

Rome built wonderful roads to expedite the movement of her legions and to make accessible the remote portions of her empire. Rome built for the future generations. Many of these roads are still serviceable. With us, likewise, accessibility seems to have been the prime reason for our first stride in this direction toward good road systems. but speed, comfort and economy, as well as convenience, have been the great contributing causes of our later undertakings which have made us known the world over as the road builders of the twentieth century.

The automobile has been the great plane which smoothed our high ways. The motor manufacturers have been successful in getting the farmer out of the rut, as well as aiding the soldier in the trenches. The economic value of the good roads system is beyond the power of the statistician to reckon. It has linked up agricultural districts with the cities, has reduced to a minimum time and expense in marketing the crop, has brought to the country all the city's glamour, comforts and social advantages, has given the farmer's children the same educational advantages as the city child, and under more healthy conditions; in fact, made him the envy of the less fortunate city brother; while it has taken the merchant, capitalist and business man into the agricultural districts, broadened his views agriculturally, shown him the full strength of the nation's collateral and given him business opportunities of which he never dreamed. It has opened up avenues for investments and put him in closer sympathy with the producer through the full realization not only of his needs, but his ability to fulfill his obligations.

THIS WEEK'S COVER

Early this month A. W. Morris & Sons of Woodland sold four head of Holsteins in the National Sale at Philadelphia for $26,000, an average of $6500 each. The yearling bull Sir Aaggie Mead De Kol brought $11,000; Tilly Alcartra 2d, a three year old daughter of the "Wonder Cow," sold for $11,200; the yearling heifer, Lady Marco Alcartra, sold for $2150, the second highest priced female in the sale, and was only topped by the world's record 51 pound cow. The two year old heifer, Lady Mead Salambo, sold for $1700. Aside from the fact that the four California entries made the highest average of the sale, as well as establishing several other records, they carried to the East added proof of the possibilities of this state from the standpoint of superior live stock production.

California breeders, as well as others, can gain an important lesson from the sale of those four Holsteins. The Morrises weren't "lucky"—they have simply applied a high order of intelligence to their breeding operations, and have had the courage and faith necessary to carry them through the vicissitudes that beset the paths of all. What the Morrises have accomplished can be equaled by others—but not with less hard work and persistency than the Woodland breeders have given their work.

The Harvest is Great and the Laborers Are---?

AS yet the labor situation seems to be more in anticipation than in realization. There is no surplus labor in sight. All are busy, but so far as definite statements have come immediate needs are met. There has been much of planning and organizing in preparing for the harvest period. As a rule, however, wages being paid are high, and with fruit prices of this year this is possible. Apricot growers feel that $100 a ton fruit justifies taking extreme care of every ounce of it.

Another feature of this season's effort to secure labor has been more general attention to housing, care and comfort for the laborers. Too often in the past the blanket man was expected to come and give satisfactory service without any attention being paid to his food or opportunity to rest or have enjoyment. In this particular the San Joaquin Valley has taken more advanced steps than other sections. As an indication of this we quote from a recent issue of the Fresno Republican:

Kingsburg farmers decided to prepare for better housing of farm labor, at a meeting held at the Kingsburg high school building last night. The meeting was called by the farm bureau, and presided over by Director C. E. Ericcson. Farm Adviser LeRoy B. Smith attended. O. V. Cobb, manager of the Valley Fruit Growers Association, spoke on housing problems, and the distribution of labor during the fruit picking season.

To meet the demands of the new state housing law, which goes into effect July 21, it was planned to invite a representative of the state commission of immigration and housing to attend a mass meeting which may be called in a few days. Director Ericcson will also name a farm bureau labor committee of three men to cooperate with the Valley Fruit Growers Association in supplying labor for the apricot harvest now beginning. Extensive drying operations are predicted in Selma and Kingsburg within the week.

W. H. Say, director of the Selma farm bureau center. was present and planned to bring the labor situation before the farmers of Selma. It appeared to the directors that the new housing law as applied to small farmers will work such hardships on individuals that community camps offer about the only solution. The state officers are to be asked to explain the law, and Byron W. McKeen of Kingsburg, a member of the assembly, will also be conferred with and asked for his interpretation. Numbers of families are coming into the country with camping outfits on their cars, and the small ranchers are anxious to know whether the state will require any more shelter than the campers are providing for themselves.

As noted in the letter from Mr. Cobb, quoted on last week's editorial page: "There should be no shortage of help during harvesting season, especially as we are perfecting a system of the proper distribution of labor, we shall then have at hand and avoid wastage of time, in securing new jobs for men and placing them at work which has been so common in the past."

Farm Adviser Smith of Fresno County Writes:

The Fruit Growers Association is the farmers farm labor employment bureau. This association working closely with the federal employment office handles the farm labor situation in such a way that it is not necessary for the farm adviser's office to serve as an employment agency. We do, however, cooperate in every way possible with the employment service mentioned.

During the current months at Farm Bureau Center meetings, we are discussing the farm labor situation. Representatives of the Valley Fruit Growers Association are present at the meetings to explain how the association is handling the farmers' calls for assistance and what they are doing to secure a labor supply. In these discussions at the farm bureau center meetings, farmers have been discussing hours of labor, wages, "cook time", camp conditions and all other conditions relating to farm labor. The discussions at these meetings are proving very helpful in that farmers here learn what is going on in different communities.

Geo. C. Roeding of Fresno.

Labor is rather scarce but as far as I have been able to learn, we are getting such help as we need, although wages are running very high. We are paying men where they are being boarded at the rate of $2.50 a day and when men are boarding themselves, $3.75 a day for the general run of work.

From the Lima bean country former Farm Adviser Essig, now manager of the bean growers pool writes:

E. O. Essig.

I wish to state that I am not conversant with the labor situation of this country now nearly as well as when I was farm adviser, and can only say that so far as my knowledge and experience goes at the present time, I have heard of no complaints as to a probable shortage of labor for the coming harvest. Neither do I know of any steps being taken to prevent such shortage, although it is perfectly possible that the farm bureau has done something along this line.

C. C. Teague, Santa Paula.

While there has been no surplus of labor in this locality this year, we have gotten through quite comfortably. The peak of the load is over so far as the spring and early summer work is concerned, and I am inclined to think that with the lemon and orange picking pretty well out of the way there will be enough labor to take care of the harvesting of the apricots and the fall work.

Despite these favorable reports there has been some loss because of real shortage. Near San Francisco the strawberry packers suffered quite serious losses. In addition we note in United Press dispatch quotation from a large raisin grower in the San Joaquin Valley:

"It takes from 15,000 to 18,000 persons to harvest the raisin grapes. We can provide all but between 7000 and 8000 of these at home. But we must import the 7000 or 8000 persons, and they must be brought here with the understanding that most of them will work only about two months."

The raisin production this year will aggregate approximately 200,000 tons.

The Women's Land Army is largely out of the work this year. However, we note in the Hemet News:

The farmerettes who came out from Los Angeles and helped in the Elsinore apricot orchards last summer, may come again during the coming season. Mrs. Janette Oswold, who chaperoned a party of 40 young women in the Elsinore district, was in that locality again on Wednesday and Thursday, seeking to find whether the services of the Los Angeles farmerettes will be welcomed the same as in 1918. She said that so many of the girls, who went up into the orchards last summer, have applied to her for similar work this season, that she is out getting information on the subject.

Also in the Lodi Sentinel:

The Woman's Land Army will arrive in Lodi today and take up summer quarters at the municipal park. There are 30 of these patriotic workers and they are ready to continue the great success of last year.

In Arizona and New Mexico.

J. O. Miller, farm help specialist serving Arizona and New Mexico for the United States department of agriculture, writes:

A careful survey of labor conditions in the Southwest shows that at the present time labor demand and supply are about equal. Here and there the demand is slightly in excess. The apparent supply, however, is about 15 per cent under normal.

When the peak loads come this summer and harvests are being cared for, there is likely to be quite a shortage. Unfortunately under the present practice among farmers, many laborers are on and off work, their employment being controlled by the farmer's emergency needs.

Because of the fact that the labor supply is below normal generally throughout the country, the "part-time" men are being recruited for fields where work is fairly permanent. More than 1,000 men have left New Mexico for the sugar beet fields of Colorado. More are going to Nebraska. The attractive proposition coming from the wheat fields of the Middle West will attract many more.

This situation should be brought to the attention of the farmers in every community. The farmer should be advised and encouraged to hold this labor for future use. The county agent, by virtue of his close connection with farmers of his community

No Armistice---War to the Death

THE grasshoppers we have with us always; sometimes we have them a whole lot harder than others. This is one of hard years, and in addition this seems to be a year in which the high cost of living does not concern them and they have their appetites with them. The turkeys are getting fat, but everybody does not have a drove of turkeys to keep them down. The hopperdozer has been declared ineffective, or at least not so effective as other methods of handling. Next to fall plowing to completely break up the nests and destroy them, the most effective method today seems to be that of poisoning. Paris green or an arsenate are cheapest and usually thoroughly effective. Here is the formula and some notes by

R. de Ong:

The common formula calls for white arsenic or Paris green. Don't use lead arsenate instead; if so, the amount of arsenic in the bait is lowered to the point where the results will be disappointing. Lead arsenate paste contains from 12½ to 15 per cent of oxide of arsenic, while the article known as "white arsenic" contains from 95 to 98 per cent of oxide of arsenic. Grocery stores and general supply stores do not usually carry white arsenic, but only drug stores.

Where any quantity of bait is being used it is often more satisfactroy to dissolve the arsenic with sal soda and mix the poison into the bait as a liquid instead of a dust. When the latter form is used it is difficult to prevent breathing in more or less of the dust, this danger being overcome by using the liquid form.

The proportions are one part of white arsenic to two parts of sal soda (washing soda). Dissolve the soda in hot water and then add the arsenic, heating until all is dissolved. This should be done out of doors and considerable care taken not to breathe the fumes as they are very poisonous. The dissolved poison may be used in mixing up the bait in this way, giving a very uniform mixture. Or this poison solution may be used for succulent baits, such as alfalfa, which are simply dipped or sprinkled with the solution and then distributed, or the material may be sprayed over weeds where the grasshoppers are feeding. It should not be used on plants of any value for it is one of the most dangerous plant poisons we have, and also great care should be taken not to apply it anywhere that stock would have access to it in grazing.

Poisoned bait should be scattered very lightly, otherwise it dries out, is not eaten by the grasshoppers and becomes a menace to other animals, or, if left in quantities around the crown of trees may injure them. The broadcast grain seeder is one of the best means of distributing the bait, this giving a very uniform result capable of being regulated to any amount desired. The usual amount is five or six pounds per acre, repeating the application every few days where they are abundant or are coming in freely.

If the insects are feeding mostly on the trees and are seldom found on the ground, the amount of molasses should be increased to 1½ or 2 gallons per 25 pounds of bran. This makes it sticky enough so that it will readily adhere to the leaves and thus make it more available. Bait made in this way is too sticky to distribute with a seeder, but should be lightly sprinkled by hand through the tree top. Large lumps on the leaves or the crotches of the tree may cause

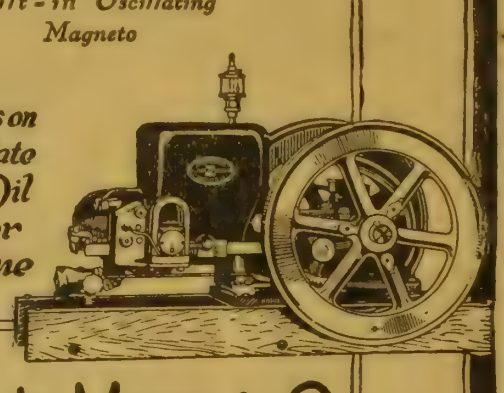
A New Kerosene Engine

There is now no reason why every farmer in the U. S. should not be successfully using kerosene for engine fuel. This new 1½ H. P. size completes a *line* of



KEROSENE

What New Varieties Shall We Grow, What Old Ones Discard?

Address by J. E. Bergtholdt Before Nurserymen at Riverside

THE nurseryman should be not alone a propagator of trees, but should qualify himself as an expert practical horticulturist; he should employ himself in trying out new varieties and variations from the true type of the standard varieties.

He should, however, under no circumstances catalogue or offer for sale any new variety or any variation from the true type of older varieties until he has absolutely demonstrated by every practical test, covering a reasonable period of years, that the fruit he is about to introduce is in both quality and productiveness superior to any similar variety ripening at the same time and that it is all that is claimed for it. No new varieties should be adopted for propagation by any nurseryman until this acid test has been conscientiously applied.

Old Varieties

It is a common practice of nurserymen to propagate a large number of varieties that should be discarded and others that are merely duplicates of other varieties of equal, or more, merit.

This method has caused untold loss to the planter who makes his selection from the promiscuous descriptions and recommendations of a nursery catalogue. It is of no benefit to the dealer, who prefers to handle only the best staple sorts instead of a conglomeration of varieties of the same kinds, and it has been a loss to nurserymen, who each year burn a lot of odds and ends of varieties for which there has been no demand and which cost just as much to produce as trees of the better sorts, and which, if better judgment had been exercised on the part of the nurseryman in making up his budding list would have shown a profit to his business instead of an addition to the brush pile.

Nurserymen should not catalogue and grow trees of every variety of fruit known to horticulture. A better plan is to thoroughly and reliably advise yourself as to the requirements of commercial fruit growing and catalogue only those varieties which are of the best standard proven commercial sorts and let your recommendations for the planting of each individual variety be a reliable compendium of practical information for the planter, instead of a lot of promiscuous misinformation that you have gleaned from some encyclopaedia.

Any assortment of nursery stock that comprises the best commercial sorts will answer to the same degree for the purpose of home orchard plantings.

To this end I would advocate, and in our own planting we follow, the elimination of varieties that are duplications of one another, choosing the better type, and the elimination of varieties that are not equal in merit of other varieties ripening at the same season and answering the same commercial purpose.

I give below a few suggestions in order to illustrate this principle:

Apples

What is the sense of cataloging 200 or more of the innumerable varieties of apples, when all requirements of the commercial and home orchard planters, of the dealer, and of the consumer, can be satisfied in the following selections of standard sorts, ripening approximately in the order named:

Liveland Raspberry, Red Astrachan, White Astrachan, Gravenstein, Alexander, Skinner's Seedling, Yellow Bellflower, Ortley, Jonathan, McIntosh Red, Grimes' Golden Pippin, Rome Beauty, Red Bietigheimer, Delicious, Spitzenberg, King David, Winter Banana, Rhode Island Greening, Winesap, Arkansas Black, Mammoth Black Twig, White Winter Pearmain, Yellow Newton Pippin.

Crab Apples

Hyslop, Red Siberian, Transcendant, Yellow Siberian.

Pears

There are a great many varieties, but all requirements for this fruit can be practically met in the selection of seven of these best standards:

Wilder, Bartlett, Beurre Clairgeau, Beurre Hardy, Beurre Bosc, Beurre d'Anjou, Winter Nelis.

Cherries

Early Burbank, Early Chapman, Black Tartarian, Giant, Royal Ann, Bing, Lambert, Llewellyn.

Yellow Clingstone Peaches

The requirements of the canner, for an early and late clingstone, are fully met by the Tuscan and Phillips. What is desired, however, is not more than two standard varieties of equal merit with the Phillips, ripening during the three weeks intermission between the Tuscan and Phillips.

In this the Hauss, known also as the Walton Cling and Johnson Cling—a seedling of Muir and of the same attributes as the Phillips—ripens immediately following the Tuscan and adequately fills that period of the intermission, and for the period of ripening immediately preceding the Phillips, or the last half of the intermission, the Libby, of equal quality, adequately answers the purpose.

To this end, for the present, we are cataloguing as follows:

Yellow Canning Clingstones

Tuscan, Hauss, Libby, Phillips, Levi.

White Canning Clingstones

McKevitt, White Heath.

Shipping Peaches

Mayflower, Alexander, June Elberta, Triumph, Hale's Early, St. John, Foster, Strawberry Free, Early Elberta, Elberta, J. H. Hale, Salway.

Drying Freestones

Elberta, Lovell, Muir.

Canning Freestones

Lovell, Muir.

Shipping Plums

Beauty, Tragedy, Climax, California Blue, Santa Rosa, Burbank, Wickson, Gaviota, Duarte, Kelsey, Satsuma, Diamond, Grand Duke, Hungarian, President.

Canning Plums

Greengage, Jefferson, Washington.

Drying Prunes

Sugar, Imperial, Robe de Sergeant, French.

Nectarines

New White, Stanwick.

Apricots

Newcastle Early, Royal, Blenheim, Tilton, Routier's Peach, Moorpark.

Almonds

Drake's Seedling, Nonpareil, I. X. L., Peerless, Texas Prolific, Ne Plus Ultra.

Quinces

Pineapple, Van Deman.

Persimmons

Hachiya, Tane-Nashi, Hyakume.

There are others of the dark meated sorts now being experimented with at the Chico Plant Gardens, those of which proving their adaptability to California conditions, and merit, may be added to the above three tried and proven varieties.

Olives

Manzanillo, Sevillano, Ascolano, Mission.

Eighty-five per cent of olive planting is to the Mission. Olive picklers, jobbers and dealers prefer the Mission on account of a combination of superior eating quality and, keeping quality not equalled by any other olive.

Walnuts

Franquette, Mayette, Eureka, Placentia Perfection, Concord, Wilson, Wonder.

Figs

White Adriatic, Calimyrna, Mission, White Endich.

Oranges

Oonshuii, Dancy's Tangerine, Washington Navel, Valencia Late.

Lemon

Eureka, Lisbon, Villa Franca.

Pomelo

Marsh Seedless.

I will not attempt to enter into details regarding the smaller fruits. Am offering what I have said as a suggestion for practical nurserymen. On the whole let us apply a greater degree of common business sence conscientiously exercised in our nursery business.

DRIED FRUITS AND VEGETABLES

Before we put our money into a drying plant let us be sure that there will be plenty of work for it to do. It will be wise for us to profit from the lessons furnished by the construction of local creameries and canning plants. Thousands of creameries have failed because there were not enough cows to support them and a good many canneries were built that learned to their sorrow that there were no vegetables to be canned.

Raisins, prunes, peaches, apples, etc., have always been in the market, but the war has taught us to develop new systems of dehydration, and now vegetables like the potato can be dried and preserved or made into potato flour. We may well be enthusiastic about the future industry of dehydrating fresh fruits and vegetables, preserving them thus for human food.

Community life being so complex, one thing depends upon another, and no matter what the growing conditions may be a system of roads which are passable at all times must be constructed in order to cut down the expense of transportation to and from the dehydrating plant or potato warehouse. A vinegar factory should be erected alongside of the dehydrating plant which can be equipped to distill crude alsohol for fuel, light and power on the farm.

1919 APPLES

The bureau of crop estimates says that the Watsonville district which shipped nearly 2,500,000 boxes of apples in 1918 has prospects for a ten per cent heavier crop this year. Newtowns, the principal variety, are about the same as last year, while Bellflowers are considerably heavier. The Sebastopol section is now estimated at about 750 carloads of which aproximately 500 will be Gravensteins. It is too early to forecast dried apple production although the Watsonville district is now forecasted at about 5,000 tons of dried apples, and Sebastopol at from 3,500 to 4,000 tons, which is almost equal to the very heavy production of 1918.

HOOD RIVER APPLES

The Hood River district of Oregon will ship from 2,000,000 to 2,250,000 boxes of apples in 1919 according to present prospects as compared with about 1,350,000 boxes last year. Hood River promises by far its largest crop. Other districts in Oregon are equally promising and promise bumper crops. The Rogue River is now estimated at 755 cars, the Mosier and Dufur section at 300 cars, and the Milton-Freewater section at 500 cars as compared to 250 last year. The state as a whole has prospects for nearly twice as many apples as in 1918.

BIG PEACH CROP

California's peach crop is now estimated at a 40 per cent increase over the crop of 1918 and ten per cent increase over the record crop of 1917. Ordinarily about ten per cent of the crop is shipped as fresh. If this proportion is maintained this year it will mean a fresh peach shipment of approximately 3,625 cars. Comparative prices for fresh, dried and canned fruits will, however, be the governing factor.

Book Review

VARIABILITY OF SOILS

"The Variability in Soils and its Significance to Past and Future Soil Investigations," is the title of Volume Four, Nnmber 5 of the University of California Publications in Agricultural Science. This is a purely technical and scientific publication written by D. D. Waynick and L. T. Sharp. It has to do with variation, magnitudes, statistical constants and a few other terms which make it of probable great interest and value to the scientific man and poor reading for the practical farmer.

GRAVENSTEIN CROP AT SEBASTOPOL

The Gravenstein output of the Sebastopol district of Sonoma County is estimated at 500 carloads as compared with 300 last year. This is the only highly specialized early apple district in the West.

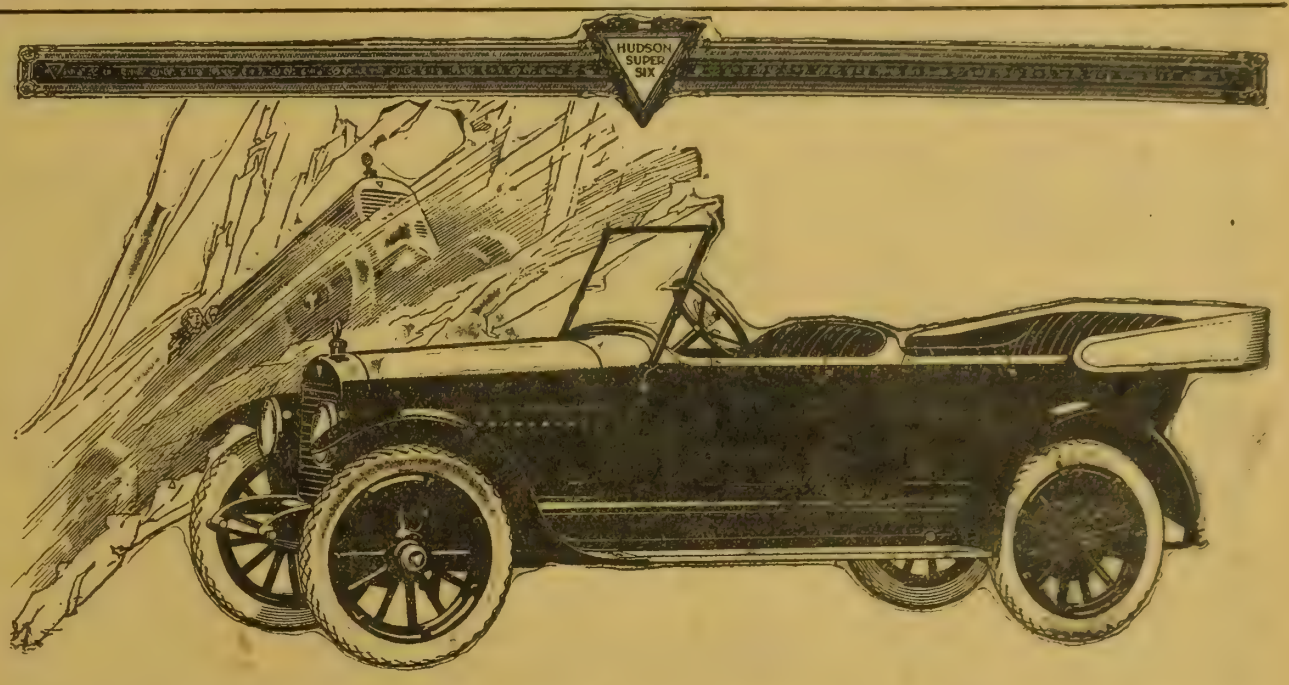
PRODUCING NEW FRUITS

California has many a plant producer who is delving into questions of hybridizing and fruit selection to the end that a new and improved product shall be given to the world. These thinkers and observers are often responsible for great advancement in fruit growing or other producing interests. One of these men, J. M. Mack of Fallbrook, has done some experimenting and within the past few years has produced new grapes, peaches and other fruits. His latest is a new tomato, a solid meated fruit with but little cavity and but few seeds. The producer has greatly reduced the sharp acid taste so characteristic in most tomatoes.

THE GOLDEN WEST

One of the newest of California publications is the "Golden West," a semi-monthly magazine edited and published by Charles E. Stokes, 1428 Oak Circle, Los Angeles. It is an illustrated all around California magazine giving stress particularly to rural California and to beautiful California. The principal contributor is Carrie Lee Carter-Stokes, who has a way of writing of things Californian most interestingly.

HARD LUCK FOR SOMEONE



The monthly assizes were in progress at the mining camp of Howling Wolf, and the courthouse was crowded with a motley throng, who took a deep, if somewhat noisy, interest in all the proceedings.

The uproar got worse and worse, and at last the judge could bear it no longer.

An imposing figure, in a moth-eaten white wig, he rose to his feet and bellowed out:

"Gentlemen, and also prisoner, I must insist on order in the court house. Here I've tried four cases already, and haven't been able to hear a single word of the evidence."—Pearson's Weekly, London.

Good clothes do not always make the man, but they certainly help make an impression. A colored label on a box will not make high grade fruit, but it will help sell them.—Florida Grower.

$1975 Buys the New Hudson Super-Six

It Is Just Such a Quality Car As You Might Expect—Dealers Are Now Showing It

How often you must have heard users say the Super-Six is potentially the finest automobile that is built.

Four years with 60,000 cars in use have shown how to free it from many of the annoyances regarded as inevitable to all cars.

It expresses the attainment of an ideal long cherished but never before possible.

Experience Showed the Way

Hudsons have been leaders for ten years. The Super-Six was the result of six years' experience. It marked a new advance in motor cars, for it minimized vibration and added to endurance without sacrificing simplicity or increasing weight.

It gave 72% more power than other motors of equal size.

A new motoring pleasure resulted. There was power for any emergency. There were speed possibilities beyond the needs of any driver.

That was shown in its establishing speedway records that are known to everyone.

As a result the Super-Six became the largest selling fine car in the world.

Each year saw an advancement over previous models.

What was learned from cars delivered served to make subsequent cars finer and more durable.

The development in beauty kept pace with the improvement in mechanical detail.

Hudsons became pattern cars that the whole industry recognizes.

On That Experience A New Hudson Was Built

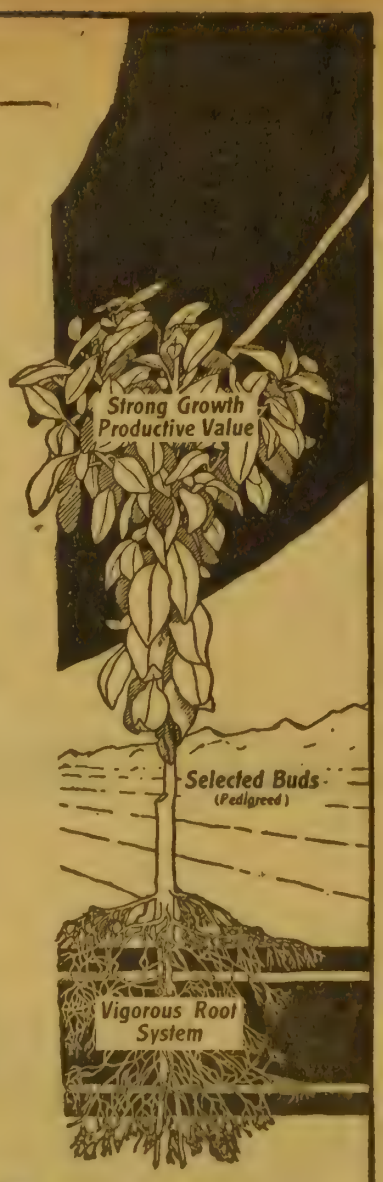
Such a car would be impossible of any other organization. The men responsible for the Super-Six are likewise responsible for its development. They have retained all its earlier advantages. It is the same fine car you know, but it is enhanced in ways that meet the standard of our ideal.

Prompt Deliveries Now
Price $1975 *(f. o. b. Detroit)*

Every season has seen a Hudson shortage. Buyers have waited months to get the car of their choice.

Prompt deliveries are possible only to early buyers.

When the new Super-Six gets into its natural swing, buyers will have to wait their turn. There has been a marked Hudson shortage for more than a year. Many dealers have already sold their first months' allotments.



This new price would in itself create a big demand. But that $1975 buys a finer Super-Six must mean more people will want it. Its over sale will be tremendous.

For that reason you will want to see the new Hudson Super-Six as soon as possible.

(1071) **Hudson Motor Car Company Detroit, Michigan**

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

NO ARMISTICE

Continued from Page 859

arsenical burning, hence the need of applying it lightly. Neither should it be used on trees with a crop of fruit upon them.

Trees which have been defoliated, but not badly barked, should be promptly whitewashed to prevent sunburning.

The state horticultural commissioner's office reports:

War on Grasshoppers

Plans for drastic action against grasshoppers and other pests were inaugurated June 6-7 at a meeting held in the offices of the state horticultural commissioner. In attendance were representatives of the various county farm bureaus, experts from the state horticultural commission, field workers of the United States department of agriculture, and many farmers from adjacent districts.

Commissioner Hecke outlined the general plan for demonstration work and read reports from the various sections showing the damage being caused throughout the state by grasshoppers. Visiting county horticultural commissioners from nearby affected counties reported conditions in their counties and were followed by Theodore D. Urbahns, assistant entomologist of the United State department of agriculture, who stated that at Paso Robles 20.000 young almond trees had been covered with cheesecloth as a measure intended to prevent destruction of foliage by grasshoppers. Urbahns said an actual survey of the different affected localities should be made in order to develop intelligent methods of control. Broadly, the two lines of activity resolved themselves to destroying the invading hordes on a given area and preventing the reinfestation of a cleaned-up area from the outside. Urbahns suggested a formula which those in a position to know asserted was a specific remedy in its results.

The grasshopper menace, to all appearances, will continue to be serious under certain weather conditions until about the middle of July. W. C. Jacobsen of the commission suggested arranging community drives against grasshoppers, after the fashion of campaigns conducted by the division against ground squirrels in the state.

It was the opinion of Prof. W. C. Woodworth of the University of California that the campaign should have been arranged far ahead of the outbreak. He expressed the opinion that the horticultural commission can operate under the law to abate the grasshopper nuisance.

Urbahns stated that sour prunes and apricots were not a complete success when substituted for lemon and orange. He stated further that corn syrup may be successfully substituted in the event blackstrap molasses is not available. He advised that alfalfa meal has been used successfully as a substitute for bran under certain conditions and that in the neighborhood of Gridley alfalfa meal has been invariably used in the poison mash against grasshoppers where the mash is to be scattered by hand.

In the afternoon a demonstration of grasshopper poison bait mixing was held at the Chase ranch, between Fairoaks and Orangevale. Large quantities of poison were mixed up and ten acres sowed. Talks were made at the ranch by Urbahns, Hecke and Prof. Woodworth. Urbahns said grasshoppers have in recent years caused such great destruction to the nation's food supply that the present necessity for increased food production makes it doubly hard for every farmer to acquaint himself with the most effective methods of destroying grasshoppers. "In some sections," said Urbahns, "the grasshopper is present year after year, causing a great aggregate loss, but hardly abundant enough to arouse the individual farmer to an active grasshopper campaign. It is this aggregate loss over hundreds and thousands of farms that must be lessened as well as the loss where the pests appear in such great numbers as to destroy the entire crop." A careful inspection of the Chase ranch revealed that grasshoppers in some sections were very numerous.

Following the demonstration committees were appointed to direct the campaign in the various parts of the state.

E. J. Branigan and P. A. Boncquet were selected to go to Butte County; Theodore Urbahns will start the campaign in Solano County; W. C. Jacobsen will direct the work in the coast counties; Carl Olsen and Prof. Van Dyke will direct the war against the grasshoppers in the northern counties, and E. M. Rust will open the campaign in the vicinity of Stockton.

Poison Formula

The following formula is said to have been found effective in destroying grasshoppers:

Paris green	1 pound
Molasses (cheap blackstrap)	2 quarts
Lemons	½ dozen
Water	4 gallons
Bran	25 pounds

Fire Warning!

In every case where it is deemed expedient to utilize burning against grasshoppers, due care must be taken (1) to safeguard contiguous orchards, grain fields and buildings; (2) to first secure the cooperation and assistance of nonresident owners by and with the consent of the local fire warden or other authorities, and (3) to utilize fire under the most propitious weather conditions regarding wind.

Supplies for Making Poison Bran Mash

The state purchasing department has received the following report on the cost of arsenic, Paris green, bran and molasses:

White arsenic—100 pounds, 14 cents a pound; 500 pounds, 13½; 50 pounds, 15; 25 pounds, 16; 10 pounds, 17; 5 pounds, 18.

Paris green—250 pounds, 46 cents a pound; 100 pounds, 47; 56 pounds, 49; 28 pounds, 50; 14 pounds, 51; 5 pounds, 53; 1 pound, 56.

Bran—One ton, $47.00.

Alfalfa meal—One ton, $32.00.

Molasses—One gallon (in 50-gallon barrels), 35c.

These materials can be purchased from all the large wholesale chemical produce and feed houses at approximately these same prices. If any difficulty is found in securing these supplies the state commission of horticulture will be glad to act as an auxiliary purchasing agent.

ARCADIAN
Sulphate of Ammonia

The farmers who used ARCADIAN Sulphate of Ammonia are realizing that they have done the right thing, as their grain is looking fine.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Italian Pea

Enclosed please find sample of Italian pea. Will you please inform me if it is edible? It is a perennial; the peas are sweet and taste like table peas.—Subscriber, Redondo Beach.

This is undoubtedly a form of Lathyrus latiflorus, the most common perennial pea. Very little material is necessary to recognize a plant as a pea vine but very full material is necessary to make sure of the species and variety, of which there are so many. Very few peas are unhealthful as food, and these only in a wild state. Cultivated forms are all believed to be good for human consumption. Animals eat all without harm, though the loco weeds belong to the same family.—E. B.

Inflammation of Crop

My hens have water in the crop. What will cure it?—Subscriber, Los Angeles.

This is not a very complete description of symptoms but, as a suggestion, this trouble may be due to catarrh or inflammation of the crop, which may have been caused by irregular feeding or feeding very heavily. More probably, however, it is from eating partially decomposed food of some kind which has poisoned the fowls. Dr. Salmon recommends a clean, dry pen for the affected bird or birds where proper attention can be given to the treatment and where the food can be regulated. The first step in treatment is to empty the crop of its irritating and decomposing contents by careful pressure and manipulation while the bird is held with its head downward. When the crop appears to be entirely freed of its contents, give two grains of subnitrate of bismuth and one-half grain of bicarbonate of soda in a teaspoon of water. This will relieve the irritation and correct the acidity. Some authors recommend salicylic acid to be given immediately after the crop is emptied. It may be conveniently administered by dissolving one grain in an ounce of water and giving two to three teaspoons as a dose. The bird should be kept without food for 18 or 20 hours, and then fed sparingly upon soft, easily digested material. If one-half grain of quinine is given morning and night for two or three days the recovery is hastened. If treatment is commenced in time most of the birds will recover.

Millet

Would like some information as to millet. What kind of soil, how much seed to the acre, how much does it produce per acre, does it require irrigation, what is best time to seed for head maturing and ripening, does it make good feed for chicks after they are three months old?—Subscriber, Odessa.

Millet has not been produced in any of the southern San Joaquin counties to any extent because it does not compete favorably with milo, feterita, or durra, for either grain or forage production. Of the few instances that we have record of in these counties it has, however, done well, but since it is adapted to the same soil and seasonal conditions as the sorghums it has been found more advantageous to depend upon these than to plant millet. It will, however, mature in a shorter season than the sorghums and consequently may be planted as late as the first of August provided the soil is abundantly moist for its germination and early growth. Planted in the late spring and early summer, as it must be, irrigation must be available in the counties mentioned. It does not stand early planting because it does not do well under conditions of cool nights.

Millet is not particular as to type of soil except that the soil should not be too heavy to prevent its being reduced to a fine seed bed. In order to be successful with millet a well prepared seed bed is essential because the seeds are relatively small and satisfactory results cannot be expected when the seed is planted on rough ground. The soil should also not be too light or sandy, for in such case the water requirements for the germination and early growth cannot be made uniform and satisfactory.

Millet may be planted at any time so far as season is concerned between

the middle of May and the first of August. Probably the June plantings however, will on the whole be most successful. It may be harvested either for hay or for grain. If harvested for hay it should be cut as soon as it has completed its bloom. If harvested for grain it may be left until it reaches the hard dough stage, but should be harvested immediately after that stage is reached if it is intended to make any use of the forage. For hay it is mowed and cured in the usual way; for grain it is best cut at the stage mentioned with a binder, stacked and threshed from the stack. If it is allowed to get ripe in the field before cutting much loss may be occasioned by shattering.

Millet hay ranks high in feed quality for ruminants, but for horses it must be fed sparingly and its effects watched carefully, for it is likely to produce diuretic ailments and may cause compaction unless oil meal or other laxative is fed with it. The grain is fed profitably to ruminants unground, but for all animals except poultry it is desirable to make it into meal, and this is especially desirable for feed for swine. Its feed value is about 20 per cent below corn and 15 per cent below barley. From my own observation I know of no reason why millet should not be a good poultry feed, but do not believe it would be as desirable as the grain sorghums. I am asking Prof. Woll to write you on this point.

As to the market for millet, I find that it is not quoted under specific headings in the market quotations, and my impression would be that in general it would not have a wide market, though a limited one might be found for it.

Blood in Goat's Milk

About ten days ago we purchased a milk goat giving one gallon per day. For a week I have noticed a reddish-brown color in the milk at the bottom of the pan after standing about 12 hours, and I think the milk does not taste quite right. She worried after changing locations and I think we overfed her on Milo Maize, as she would not touch any kind of grain or bran for three or four days, but ate a little green stuff all the time. Now she has a good appetite and we are feeding whole oats, rolled oats, beet pulp, bran, carrots, cured hay and a little green alfalfa at noon. She is giving about three quarts a day now and is seemingly all right, except for the dark coloration. The milk foams nicely. Can you tell me what this is? Is there any cure? Is the milk fit to use?—Subscriber, Ontario.

It would be best to milk this doe out three times a day; never allow her udder to become distended. The reddish deposit is caused by the rupture of small blood vessels in the milk glands or ducts and comes from a strain or blow or some other injury to the udder. The overfeeding on Milo Maize may be at the bottom of the trouble. You do not state whether you are keeping the doe alone or if she has companionship. Fretting from being alone or new surroundings might have caused the sediment. If such is the case make her contented with another doe or kid. And give her a grain ration of one pint of whole rolled oats, one pint of bran and one pint of beet pulp, by measure, mixed all together in two feeds, night and morning. Also continue the carrots and green alfalfa and all the dry hay she will eat, being sure it is sweet and free from mold. Also give a teaspoon of Epsom salts syrup once a day in her mash, for a week or so. The Epsom syrup is made by taking one cup of Epsom salts, one cup sugar, one cup of water and heating all together until thoroughly dissolved. Cool and put in screw top Mason jar or bottle and keep tight corked. In this way the valuable properties of the salts are preserved.—Martha W. Howland.

Roadside Trees

By Ernest Braunton

ARE the roadsides in front of your property planted? If not, they should be, and at once. Nothing you can do will add more of value to property than uniform lines of suitable trees. Many cases are known, in every state, where acreage so enclosed commanded higher prices than land of equal soil value, but unplanted with highway trees. Where such trees have been destroyed courts have awarded heavy damages. In the case of grand old roadside trees that were in place hundreds of years preceding settlement of the land an award for the destruction of a single tree was in one case, $2,000; and several cases are known where the value was estimated at $1,000. So that the legal value of roadside trees has been established and at a higher value than many of us would admit as just.

In the older days of dirt roads some sections could not well be planted with evergreens, for the winter's shade prevented the roads from drying. But in these days of perfect roads this consideration is no longer a factor. On the other hand, shade preserves oiled and paved roads and adds to their life, keeping the costs of repair down to a minimum. The reflected heat from an oiled or paved road in midsummer is considerable and unpleasant, and so evergreen trees add much to the comfort and pleasure of travellers. In storms of all kinds, whether rain, dust, or simply wind, the evergreen tree proves a great protection to all who travel in such weather. The argument is all on the affirmative side. Let every roadside be planted at once, and if possible with evergreen trees.

Best Roadside Trees

Many will have a deciduous tree, and to these refractory friends we advise planting Platanus orientalis, the oriental plane or sycamore. There is also a hybrid, equally good, a cross between the oriental plane and the one common in the Mississippi Valley, known as the London plane. In damp, sandy soils the soft or silver maple is an excellent tree and, again, some elms are splendid. Few evergreen trees have the beauty of the deciduous tree during summer, but in this climate we should have shade and beauty throughout the year. When all our land is green and crops and wildflowers are in bloom, a bare, leafless tree is a bleak, inhospitable, almost uncanny sight.

Among the evergreen trees none shine so brightly as the liveoaks; none are more appropriate to California landscapes. There may be sections where they do not thrive, but these parts are unknown to me. A close rival, yet a less handsome tree, is the cork oak and it is also hardier, enduring more degrees of cold. In the south nothing surpasses in effective beauty the grand old pepper trees and they will always hold first place in the hearts of many. Were they not troubled with black scale, the south end of the state would now be a network of them and also be the most beautiful country on earth. For if every roadside were planted with large pepper trees the world would not hold a rival for landscape beauty. Some of the eucalypts will do where the robbing of soil in adjacent fields is not a serious consideration, but the most beautiful of all eucalypts, E. calophylla, is seldom used. Many of the acacias are excellent, and among them none so much please me as A. dealbata, the silver wattle. I feel confident Ceratonia siliqua, the carob or St. John's bread, will each year become more popular, but it does not make a large tree except with extreme age.

Resolve to Plan

If your yard about the house is not well planned, well planted, or planted at all, resolve to do it as soon as you can. Leave one or more open lawn spaces and plant only in the borders. Do not spoil the open space or spaces with trees or shrubs. Place one or more trees where needed for use. Place a deciduous tree where its shade will fall upon the kitchen or other rooms in summer. In winter the leaves are gone, and light, air and sunshine are freely admitted. If space permits, place a few trees back of the house so it will appear protected and

be part of a picture. There may also be room for some along the sides without being close enough to make the house dark and damp during winter. The object of this planting is to frame the picture. The house, lawn, and spaces on all sides of the house form the picture. Frame it, but do not let the frame of trees and shrubs too closely crowd on the picture. In other words, do not have all frame and no picture.

Many times I have heard a garden owner say: "Mine is such an ugly old garden." And there is but one answer: "Why don't you change it?" For if you know it is ugly you must know how to make a change. You will at least know how to make it better, even if you cannot make a beautiful picture of it. Yet continual striving for the best will bring splendid results. So do not content yourself with a confession that your garden is ugly, for ugliness is a reproach, a liability, while beauty is an asset, something to be proud of, something you will be commended for possessing. There are many reasons why your garden should be beautiful, but none why it should be ugly. Then be within reason. Beauty is art, and we all admit to being artistic, yet few can prove it. Let us do our best to have a beautiful garden; we will then at least be conscious of commendable effort.

Matters of Taste

Robinson, in his "English Flower Garden," makes some strong points on "matters of taste." Salesmen offering wares will state that it is a matter of taste as to which is the better, but this is not true. It is a serious matter of fact that one is better than the other, whether it be a carpet, a painting, a horse or a house. Good or bad in garden design or aught else is not a mere matter of taste, but a matter of fact, truth and observation. Individual likes and dislikes are wholly separate from the problem of what is best in garden design and planting. Therefore in your garden work aim to plan and plant as study and observation have led you to believe it should be. If you have admired some garden or part of a garden it was because it was good; even the poorest and worst of us have some natural powers of discernment. Individual taste can find liberty and easement in the plants and other material used.

Oranges in Swamps

It is known that oranges are very sensitive to alkali or salts of any sort. But there is a small tree belonging to the family, known as Aeglopsis Chevalier, that is said to be native to salt swamps near the sea in tropical West Africa. Some of these trees are in the greenhouses at Washington, and the department of agriculture will test their adaptability for stocks upon which to bud orange and lemon. If the experiment prove successful we will plant our saline swamps with oranges and harvest the crop from boats.

Nothing now remains but to discover some member of the citrus tribe that is a true epiphyte or living upon air. Then we may grow oranges on the sides and roofs of buildings and plant no more orchards. Meanwhile we shall watch with interest this alkali-resistant orange tree.

Garden Begonias

There are more than 500 species of begonia growing wild in the tropic belt of the world, and several hundred hybrids have been bred by horticulturists; yet in gardens begonias still are scarce. Of all common plants none more enrich the garden than begonias. They thrive best in partial or complete shade, in a soil rich in humus and therefore holding moisture well. Begonias will never grow in a dry or coarse soil and the more finely pulverized the soil the better will they thrive. The roots should be cool and moist and if these conditions be present the tops will stand full sunshine in nearly all species and varieties. When well cared for the better class of flowering begonias produce marvelous crops of beautiful flowers of wax-like texture.

Orchid Tree

This name has been applied to the bauhinias, tropical trees with showy flowers, native to various parts of the world. The trees are not rare in the south and central parts of California and are among the showiest of all flowering trees. Three species are growing in gardens of Los Angeles, Pasadena, Redlands and up to Santa Barbara. B. alba is white; variegata is pink, red, and yellow; and purpea, as its name implies, is a rich purple. One shrubby species, with brick-red flowers, Bauhinia Galpinii, has been sparingly grown and is the showiest of all, but for some reason it is now a very rare plant, few being able to grow the plants to large size. Yet one in Santa Barbara that I saw was 10 feet high, 20 feet across, and almost a solid mass of flowers.

Most troubles are best eliminated at the SOURCE. Bad roads are the SOURCE of much UNNECESSARY tire expense. ARE YOU BOOSTING GOOD ROADS?

The Extra Ply of Fabric Means Extra Miles

Mohawk tires contain an extra ply of standard weight fabric—a ply that other makers do not think it necessary to use.

So we believe in building tires—not only the treads that show, but the parts underneath that do not show—with the greatest amount of strength it is possible to give them.

You may find another tire with a so-called extra ply. But you will find no other tire with as many plies of 17¼ ounce pure Sea Island Cotton fabric, as the Mohawk tire contains.

It is better quality throughout—only pure materials—more generous quantities of these—the fact that Mohawks are hand-made—that enables us to dare tell you that tire building today is not a question of secrets or special processes, but of *quality* alone.

And it is this *quality* alone that gives the Mohawk tire a *permanent* clientele. Just ask yourself—what automobile owner whom you know buys only *one* make of tire, *always?* Mohawk buyers *do.*

Mohawk tires, either cord or fabric, are made in ribbed and non-skid treads and there's an extra ply, hand made. Ford size Mohawk, too.

Animal Parasites

By E. R. de Ong

THIS is the second article by Mr. de Ong on Animal Parasites. The first, which appeared in the Cultivator of June 7, dealt with house flies, stable flies, horn flies and horse flies.

Flesh Flies (Blow Flies)

Eggs are deposited on decaying flesh or living larvae may be deposited. The larvae feed for a few days on the decaying flesh, then crawl down into the ground to pupate and emerge as adult flies. When carrion is abundant these flies increase very rapidly and if there is no suitable place for depositing their eggs or young, they frequently turn to wounds on living animals. With sheep "fly blowing" usually occurs on the soiled wool although they also are subject to attack in wounds. In regions subject to fly attack, all operations, such as castration, branding or dehorning should be done early in the spring. A wound infected with maggots should be cleaned thoroughly and then a two per cent carbolic acid or creolin solution should be injected by means of an oil can. Another mixture for injection is chloroform, one part, to sweet milk, four parts. The best preventive of fly injury is prompt burning or deep burial of all animals dying on the range. Shallow burial, particularly if the ground is dry, will not prevent fly breeding, for the carcass will be located by the odor and the eggs laid on top of the ground. The larvae from these eggs burrow down through the loose ground, feed and then pupate near the surface where the adult fly may easily escape. Blow flies have become very serious pests of the sheep range in Australia on account of the great number of rabbits that are killed and left to decay.

Mosquitoes

This insect breeds in shallow, stagnant water, as is well known. Drainage of shallow pools and deepening of channels in large bodies of water are the best preventives. Covering the surface of the water with a film of oil will kill the wrigglers and pupae, but the application must be repeated every eight or ten days. Small fish or even water dogs have been reported as good destroyers of mosquito larvae.

Fleas

The litter in the stable, hog shed and in the chicken yard furnishes ideal breeding ground for these insects, while in the house the permanent carpet, undisturbed for months, furnishes the proper medium. The eggs are laid in the hair of cats and dogs where the flea is feeding, but drop on the bedding where the animal sleeps. The larvae feed on dry flecks of undigested blood which the adult passes when they are feeding, together with organic material and dry manure. To rid infested places of fleas, sprinkle them freely with crude oil or distillate. Spray the bedding and chicken house floor with any light oil, such as kerosene or distillate.

Pyrethrum or buhach may also be sprinkled freely over the sleeping quarters of animals and then swept up and burned. Dogs may be bathed in a two per cent creolin mixture. Spray hogs with a mixture of kerosene, one part, and water, four parts, using about half pound of dissolved soap per gallon of oil to make the oil and water mix. In the house remove carpets and rugs to the ya and give them a thorough beatin Dust the floor with pyrethrum a then sweep up the powder carefull and burn it as it stupefies but seldo kills the insect. Or the floor may b scrubbed with boiling hot lye wat or mopped with kerosene.

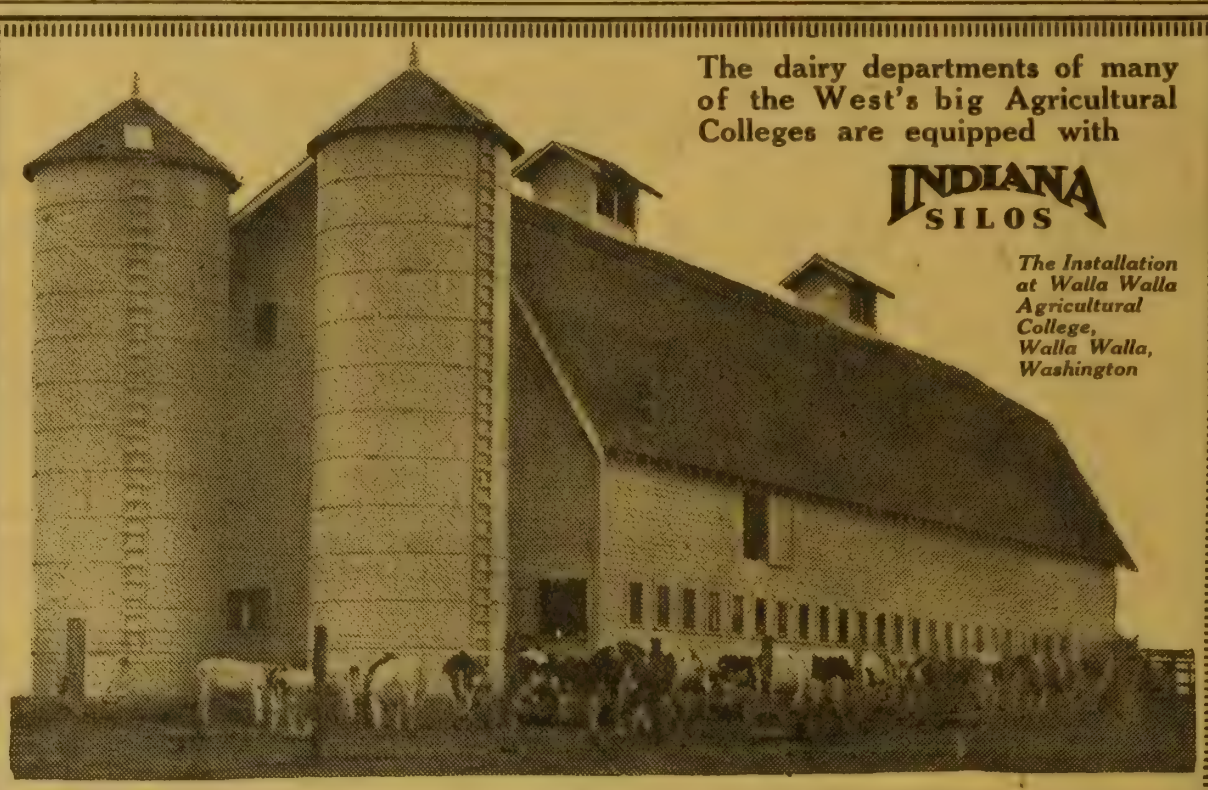
Bot Flies

Different species of this fly attac cattle, horses and sheep. With th horse and cow, the egg, a conspicuou yellow object, is glued to the hair o the legs or chest. In a few days th larvae are ready to emerge and th horse in licking itself takes them u on its tongue, whence they pass to th stomach and there attach themselve to the stomach wall. Here they re main through the winter, absorbing the food of the horse. In the spring they are mature, pass out with the feces to the ground and crawl beneath the surface to pupate, emergin in a few weeks as adult flies ready t lay eggs. During the summer they may often be seen hovering about horses, darting in occasionally to de posit their eggs.

Horses kept in dark stables through the day are less subject to attack than are those running out through the day. Touching the eggs with kerosene will kill them or clipping done very soon after the eggs are deposited will lessen the infestation. This is a common pest of horses and unless very abundant seldom causes serious trouble.

Cattle Bots or Warble Flies have a life history similar to the Horse Bot, except that the larvae lodge in the back just beneath the skin instead of going to the stomach. The first sign is a small tumor-like swelling usually along the spine, and as the larvae grows these become quite noticeable when the hand is rubbed over the back. When mature the larvae work their way out through the skin, drop to the ground and pupate. When several are present they are a distinct hindrance to the thrift of the animal and reduce the flow of milk. They also reduce the value of the hide for tanning purposes.

The egg of this fly hatches soon after being deposited, so that it is difficult to kill them, but as with horses, cattle feeding through the day are most subject to attack. The larvae may be killed in the back of the animal by rubbing in oil, but when killed while in the back they make a serious wound so that it is better to press them out with the thumb when almost mature and then kill them. If dropped to the ground they may pupate and emerge as flies.



The sheep bot lays the living larvae in the nostril, whence they migrate upwards and lodge in the hollow chambers of the nasal passages. Their presence is shown by a discharge from the nostrils and as the larvae approach maturity an occasional violent fit of sneezing will force them out on the ground where they soon burrow under cover. Smearing the nostril with pine tar as a repellant against the fly is of some value.

Lice

There are two distinct kinds of lice, biting and sucking, the latter are found on mammals, the former on both birds and mammals. The biting lice have broad heads about as wide as the body, while the sucking lice have very narrow heads. The food of the biting lice is barbs from the feathers, when on birds, or dried flakes of the skin. The principal injury which they cause is the irritation from their claws. The sucking lice, as the name indicates, feed by sucking blood from the host.

Poultry lice are controlled with insect powders, sodium flouride or a mixture of gasoline, three parts, and carbolic acid, one part, stirred into plaster of Paris. When dry the mixture may be stored in tight cans and used as needed. Lice powders are dusted into the feathers of the fowls and allowed to remain. A lump of blue ointment the size of a pea may be placed in the feathers near the vent, this being a very satisfactory remedy for chicken lice.

Lice on animals are usually controlled by dipping or washing, using nicotine solutions, coal tar preparations, or creolin. Directions for using these will be found on the package in which they are sold. A 10 per cent kerosene emulsion may also be used for hogs, that is, one part of kerosene to nine parts of water with enough

The dairy departments of many of the West's big Agricultural Colleges are equipped with

INDIANA SILOS

The Installation at Walla Walla Agricultural College, Walla Walla, Washington

You notice Indiana Silos are often in pairs

That's a very significent fact. Not only do you see them in pairs, but you find them in threes and fours, too. Nothing but a successful silo could tell that sort of a story, for farmers are too shrewd to duplicate losing investments.

INDIANA SILOS

Will make your silage feeding pay biggest profits

Biggest profits in better feed and less waste; biggest profits in fatter stock and richer milk. And yet the Indiana Silo is the cheapest in the end and most convenient to build. Everything needed comes to you in one shipment, and three men can put up the usual size in two or three days. The famous Indiana doors and the special tongue-and-groove staves keep air out and moisture in. Indiana Silos do not leak; they do not fall down; they do not burst. They keep the silage fresh and sweet.

45 Royal Shorthorns 45

at Public Auction

State Fair Grounds, Sacramento, Calif.

Thursday, July 10, 1919

Hallwood Villager 495521

Mr. W. M. Carruthers, owner of Carruthers Farms, Live Oak, California, will without question offer to the public on this occasion the highest class lot of registered Shorthorns that he has bred and assembled during his twenty years of activity in the breed's affairs on the Pacific Coast.

It is an opportunity for the purchase of high class individuals, nearly all of straight Scotch breeding, that may well claim the earnest attention of every person in the west who either wants to strengthen an established herd or found a new herd upon animals of correct breeding and type.

The offering is happily balanced to meet almost any requirement, containing as it does a considerable number of splendid Shorthorn matrons with calves at foot by great sires, richly bred heifers in calf to famous bulls, and an extra good selection of open heifers, a total of 42 females. The bull offering, though small in number, contains the star attraction of the sale in

Hallwood Villager 495521

Conceded to be one of the very greatest bulls in the west. He has every essential qualification of a great sire, breeding type that has been proven in the show ring, and perhaps best of all, the living proof in the form of his young sons and daughters that he will hand down his rich inheritance of form and quality.

Every Shorthorn breeder and prospective Shorthorn breeder in the west should find pleasure and profit in seeing this excellent group of breeding Shorthorns change ownership on sale day, and it promises to be a history making event for the breed on the Pacific Coast.

EVERY ANIMAL IS TUBERCULIN TESTED AND GUARANTEED TO BE A BREEDER; EVERY YOUNG ANIMAL IS PERMANENTLY IMMUNIZED AGAINST BLACKLEG BY PURITY BLACKLEG AGGRESSIN MADE BY THE KANSAS PROCESS.

The cattle are now all on the sale grounds at Sacramento and you are cordially invited to call and see them and study their pedigrees in the sale catalog which is now ready. A copy of the catalog will be mailed on request.

Sale Starts Promptly at 1 P.M., Thursday, July 10

soap in the material to cause the two to unite when agitated. Crude oil is sometimes placed in the hog wallows or a rubbing post well covered with oil should be in each corral. The latter do not, however, kill the lice around the flanks and shoulder pits. These parts of the body should be occasionally washed with oil emulsions.

Lice are becoming numerous on sheep in recent years, especially in the mountains.

Sheep Tick (louse fly)

This is not a true tick such as found on cattle, but a wingless fly which spends its entire life on the host. Lime-sulphur solutions are not effective as a dip for this insect and dependence should be placed on the regular "sheep dip" or some of the coal tar preparations.

Sheep Scab

This is the work of a tiny mite which burrows into the skin and causes the formation of a scab which results in the dropping out of the wool. Similar infestations are also found in cattle and occasionally on horses and cows. These are usually controlled by dipping in lime-sulphur solutions, nicotine preparations or the coal-tar-creosote dips. The dip is heated to a temperature of 95 degrees to 105 degrees Fahrenheit. For rams the water should never be more than 95 degrees Fahrenheit. In the process of dipping the animals should be held in the vat by means of a gate for at least one minute and from that up to three minutes for animals with heavy fleeces. Sheep will remove about half a gallon of dip per animal so that allowance must be made for keeping up the supply and also for heating the new stock. Dipping is usually done with commercial preparations which have directions on the package for use.

For cattle and hogs crude oil emulsions are frequently used, but the asphalt in these dips prevents their use for sheep.

Scab on dogs can be controlled by an application of equal parts sulphur and lard or nicotine preparations.

Ticks.

Cattle are freed from ticks by the use of the same preparations as for scab mites, except that oil emulsions and arsenic compounds are also used commonly.

Poultry ticks and mites are best controlled by the use of oil on the roosts and floors of the hen houses. If the house has a dirt floor a liberal application of crude oil worked into the soil will do much toward preventing these pests, as well as fleas, from harboring there.

Worms

Besides insect larvae, such as bots and flesh fly larvae, all animals are subject to attack by round worms, tape worms and in some instances by liver flukes. Generally speaking round worms, such as stomach worms of the sheep and cow, are not as troublesome in California as in Eastern states where a more humid climate prevails, for in most instances the egg of the worm is passed out through the feces of the affected animal, falls to the ground and hatches and the young larva is taken into the mouth of grazing animals on grass. With many species the eggs or larvae are easily killed in dry, hot situations so that our California ranges are not suitable for their increase. However, swampy pastures, or those containing marshy places, or the north coast regions are all favorable for the development of such pests, and care should be taken to prevent their spread. Drinking troughs filled from wells or deep streams are safer than to allow stock to drink from mud holes or shallow streams. Draining marshy places in the pasture and, if the infestation is severe, placing the stock on dry pastures, are all of value. Infestation of hogs may be prevented to some extent by feeding from troughs or concrete floors which are occasionally washed off. Where chickens are affected they should, if possible, be put on new ranges.

Liver flukes attack cattle and sheep, especially in the northern coast counties. These differ from round worms in that they spend part of their life in the body of a snail. After partial development in the snail they leave this host, crawl up a blade of grass and there cover themselves with a little sheath and wait until a cow or sheep in grazing eats the grass. When taken into the stomach they migrate to the liver and there complete their life cycle.

Prevention is the only remedy, that is, keeping stock off of snail infested pastures when flukes are causing trouble. For only in the presence of this first host is infection possible.

Tapeworms

Tapeworms also have two different hosts, the first stage being spent in a grazing animal, such as sheep or cattle, where their presence is known as bladder worm or measly beef, and the second stage in a carnivorous animal such as a dog, hog or man. Here it is in the form commonly known to us as tapeworm or flatworm. This worm consists of a head, more or less firmly attached to the intestinal walls and a great number of mature flattened segments attached end to end. Each segment contains male and female organs and ovaries, so that when mature it is practically an egg sac. These segments are passed out in the feces, the walls rupture and the eggs are carried about by the rain or running water. They finally lodge on grass and are eaten by grazing animals. This egg when taken into the stomach hatches and gives rise to the larval or immature forms of tapeworm. These lodge in the muscles of the animal either singly or in the bladder form, in the latter a number of embryo heads of tapeworms may be seen as white specks in a large transparent body resembling a fish bladder. When an animal containing one of these forms of infection is eaten by a dog or cat, then the heads of the tapeworm lodge in its intestine and give rise to the mature tapeworms. The larval form of tapeworm is found in mature rodents, such as rabbits and possibly gophers as well as sheep and cattle, hence the danger of feeding uncooked carcasses or the intestines of such animals to dogs or cats. Man is also subjected to

DUROCS OF THE
BEST BLOOD LINES

Bred sows, gilts bred and open. Have one very nice O. C. K. boar 9 months old. Dam sold for $1,100 and sire for $1,000 in last month's sale.

Jersey Queen Farm, San Jose, Cal.

such dangers when partaking of underdone or uncooked meat. It is in this way that we contract tapeworm and also trichina (a round worm) from eating underdone pork.

Treatment for intestinal worms in animals is really the field for the veterinarian, however a few suggestions will be given.

Vermifuge for dogs. Pelletierine tannate—5 to 15 grs. Male Fern (Oleorsin of aspidium) 15-40 minims. Kamola—15-30 grs. Areca nut (freshly ground) 35-40 grs. 30-40 pound dog—2 No. 00 capsules of pelletierine tannate or two capsules of male fern or 2½ capsules Kamala, or 6-7 capsules of areca nut. Push the capsule down the throat with the hand while the mouth is held open with a board, or the capsules may be fed in meat or in pills of molasses and meal. Feed the dog nothing but milk the evening before or give no food. Calomel one or two grains may be given at this time. The feces and worms should be burned. In infested ranges treatment should be given four times a year.

CALIFORNIA LAMBS MOVING EAST

C. M. P., writing in the June National Wool Grower, says that during the past month more than 10,000 sheep and spring lambs arrived on the Kansas City market from the Imperial Valley in California. The movement will continue. The lambs sold at $17.25 to $19, and the sheep, mostly clipped ewes and wethers sold at $9.50 to $12.25. Some clipped yearlings sold as high as $14.50. The principal loading points were Heber, Brawley, and El Centro. Richard Kinnaird, one of the largest shippers from the valley, who accompanied one of his shipments to Kansas City, stated that about 100,000 lambs are raised annually in the Imperial Valley. The lambs are run with the ewes on alfalfa and barley pasture, he says, and at the age of four months weigh 80 pounds or more. Those that sold here weighed 65 to 75 pounds. Some of the sheep weighed 112 pounds.

ARE YOU AWAKE?

Harry McNair, of Ellsworth & McNair, Chicago, a firm which has sold over a quarter of a million horses within the past five years, is an acknowledged authority on horse markets. He says:

"The farmers who breed their good mares, weighing 1400 pounds or over, to sound draft stallions of ton type, and who feed the colts so that they will make good, sound drafters, weighing 1700 pounds or over at maturity, will get big prices for all such horses before they are five years old. Prices on big, sound drafters will reach record-breaking prices before a half decade rolls by, and the men who fail to grasp the present opportunity will have only regrets to harvest in the future."

Breed your good draft mares and hold fast to the young drafters you have. Don't let the clamor of the thoughtless disturb you. The draft horse has been relegated to oblivion at least three different times in the last century alone, but there is more need for good drafters today than at any time in history.

Professor Handschin of the Illinois experiment station has but recently made public the results of seven years' cost studies on Illinois farms. His conclusions briefly are that on farms under 260 acres draft horses furnish the most efficient and most profitable source of farm power, and that on farms over that size 75 per cent of the work will still be most efficiently done by horses. Ninety per cent of all farms in the United States are under 260 acres in size. A hint to the wise is sufficient.—Wayne Dinsmore.

Book Review

FEEDS AND FEEDING

"Feeds and Feeding Abridged" essentials of feeding, care and management of farm animals, including poultry, by W. A. Henry, professor of agriculture, University of Wisconsin; and F. B. Morrison, assistant director agricultural experiment station, Wisconsin, published by Henry-Morrison Company, Madison, Wisconsin, at $2 net.

Many a live stock feeder has considered Henry-Morrison's "Feeds and Feedings," an essential to intelligent feeding of farm animals. Its recognition as a standard is almost universal. Now comes this new book, "Feeds and Feeding Abridged," based chiefly on the sixteenth edition of the original "Feeds and Feeding," but the subjects are materially condensed, omitting topics of purely scientific interest and expressing in simplest terms the most essential facts concerning animal nutrition and practical feeding and care of farm animals. In fact it is intended as a text book for schools and colleges.

The book is made up of three parts and a valuable appendix. Part one represents general principles governing feeding and care, with discussion of various feeding standards, and one chapter especially valuable is "Economy in Feeding Live Stock."

Part two discusses all important feeding stuffs used in this country and even gives an extended chapter to "Manurial Value of Feeding Stuffs," and points out the vital relation of animal husbandry to maintenance of soil fertility.

Part three takes up practical care, feeding, and management of each class of farm animals, giving two chapters to each type of animal, for instance, one chapter to feeding and care of horses and another to feeds for horses. In this division two chapters are given to feeding and to feeds of poultry, which is somewhat different from the regular "Feeds and Feeding" edition.

The appendix is largely made up of tables on composition of feeding stuffs, digestibility, variety feeding standards, energy values, weight of various concentrates, etc.

A system of sheep farming that is to be continuously successful can not ignore either wool or mutton. In many cases the two products will be worthy of equal consideration. In others either one may be emphasized according to the peculiarities of conditions, management, and marketing.

Young pigs should be given their feed in such a manner that each individual pig gets its share. The simplest way to accomplish this is to allow the pigs to eat from a properly constructed trough, one that will keep the pigs out of the feed and will lessen the possibility of crowding.

60 Head Duroc-Jerseys 60

Bred Sows *and* Gilts

Rich in the Best Blood of the breed
All Bred for Fall Litters

At Public
AUCTION

Wednesday, July 16, 1919
New Sale Pavilion
Tulare, Calif.

To the Breeder If you are interested in adding to your herd animals of extreme merit — animals rich in the blood of the greatest *Duroc-Jerseys,* we say *Come,* you will find them in this sale.

To the Farmer who wants to make more money from his hogs, who desires to increase his bank balance, who desires to secure some pure bred, registered swine, we invite you to attend this sale.

We want more breeders, we want more farmers raising the greatest of all hogs, the Duroc-Jerseys.

SPECIAL IMPORTANT FEATURE

The Tulare County Duroc-Jersey breeders are determined to make their sales of the highest standard and every animal entered in the sales must conform to this rule. A committee was appointed that has visited each herd and selected the animals in this sale. The animals consigned are from the well known and established herds of Allen Thompson, Tulare; Henry Cummins, Goshen; R. E. Clifford, Strathmore; Joe N. Chenowth, Visalia; W. J. Fulgham & Sons, Visalia; S. A. Williamson, Visalia; W. J. Stewart, Visalia; C. E. Ellis, Tulare; W. J. Higdon, Tulare; Alex. Whaley, Tulare; J. P. Walker, Visalia; R. C. Sturgeon, Tulare.

Remember, this sale will consist of *sixty bred sows* and *gilts,* all bred to high-class boars and bred for early fall farrow. They have all been reserved for this sale, although their owners have had many opportunities to sell them.

The animals in this sale are rich in the blood of the Crimson Wonders, Critics, Orion Cherry King, Golden Model, Defender, the Duroc-Jerseys that have been instrumental in building up this great breed to its present high standard.

MAKE A NOTE of the day and date of this great sale—Make your arrangements NOW to attend. —You will not be disappointed in the offering

Write immediately to R. C. Sturgeon, secretary, Tulare, Calif., and get your copy of the catalog. It fully describes each animal and will assist you in making your selections.

This is your opportunity to get on the Duroc-Jersey map. Do it quickly and at your own price.

Free lunch and cold drinks at noon.

Sale will start promptly at 10 a.m. **Tell all your friends and neighbors**

Col. Geo. W. Bell, Auctioneer **Allen Thompson, Pres.**

Duroc-Jersey Swine

July 16, Tulare County Duroc-Jersey Breeders' Association, Tulare.

Hampshire Swine

August 6, Francis T. Underhill, Santa Barbara.

Morrises Have High Average.

Frank L. Morris of the firm, A. W. Morris and Sons, Woodland, has returned from the East and reports that the four Holsteins his firm consigned to the National Sale at Philadelphia made the highest average of any individual consignment. The four head, three females and a bull, averaged $6,500.

Morris states that there was manifested a growing interest on the part of Eastern breeders in yearly records. He states that many seven-day advocates are seriously planning to place their herds on the more stable basis of yearly tests.

Morris and Sons were among the first to recognize the fundamental value of long distance performance and they are gratified to see their judgment vindicated.

Butte City Ranch Buys Shorthorns and Shropshires.

W. S. Guilford of the Butte City Ranch has recently purchased the entire flock of Shropshires formerly maintained by the Blackhawk Ranch, Diablo. Included in the purchase was a Bishop-bred ram that is regarded as one of the best sires in California. The Butte City Ranch has also purchased a number of well bred Shorthorn cows in Colorado.

Guilford says that the demand for improved live stock, especially in the Sacramento Valley, is such that it has been found necessary to increase the herds and flocks maintained at the ranch.

The annual fall sale of Shorthorns, Shropshires, Berkshires and ponies will be held at the ranch August 2.

Carey Jerseys Established Coast Record.

E. H. Roten, who managed the Ed Carey Jersey Sale held at Carlton, Oregon, July 16, reports that several records were established at the vendue and claims the world's record for Jerseys bred by one breeder. Thirty head sold for an average of $1150 which places this sale at the top for any breed on the Pacific Coast.

It was the blood of St. Mawes that proved to be the magnet. St. Mawes is one of the few gold medal bulls and has to his credit 20 Register of Merit daughters, four of which are the highest record full sisters. The story back of St. Mawes, is especially interesting in the light of the recent sale. He was purchased by Carey for $200 and after using him a comparatively short time he was sold for $75. In the meantime his sons had been disposed of at most any price that could be gotten—some were practically given away. When his daughters were put on test his ability as a sire was at once made plain, but by that time he had again been sold and was slaughtered. Had he been permitted to have lived his value to the breed could not be estimated.

The top of the sale was St. Mawes Rosaire purchased by F. A. Dorflei of Oregon for $5100. A ten-day-old bull calf was purchased by Frank Laughary of Oregon for $2100. The top price for a cow, $1550, was paid by an Oregon breeder.

Dr. H. W. Hand of Orland, president of the California Jersey Cattle Club, secured a cow and heifer to add to his herd. Dr. Hand was the heavy buyer at the recent Reid dispersal sale held at Sacramento, and secured the two-times world champion, Goldie's Nehalem Beauty.

New Boar at Anchorage Farm.

Anchorage Farm, Orland, has just received a new herd boar purchased in the recent E. J. Barker sale in Indiana. He is a son of Duke's Champion 12th, and was one of the two boars that topped the sale.

Anchorage Farm has one of the leading Berkshire herds of the country and is noted as the home of Star Leader, one of the top boars of the breed.

Great Jersey Deal

One of the biggest transfers of pure bred Jerseys on the coast was recently made when the Arden Certified Dairy near Los Angeles purchased the pure bred Jersey herd of Houston & Son, Imperial; 143 head of pure breds were transferred. Of this number there are a few bulls which the Arden people are now offering to those who wish to build up along Jersey lines.

Famous University Duroc Dies

Professor J. I. Thompson of the animal husbandry division of the University of California reports the death of the famous Duroc-Jersey boar, Model Colonel, owned by that institution.

Model Col. can safely be rated as one of the greatest Duroc boars of the West. He was not only a splendid individual of extreme size and quality but was a sire of rare merit. He was farrowed September 26, 1914. His sire was the noted Nebraska boar, Col. Protection and his dam was Model Queen 2d.

In the death of this great boar the Duroc interests of California have been materially set back.

Fred D. Ross' New Purchase

Fred D. Ross of Hanford, who sustained quite a loss in the death of his Poland-China boar, Big Bob, has just received the boar Big Timm, by Giant Timm, from Robinson Bros., of Illinois.

Robinson Bros, in a letter to Mr. Ross state that sows bred to this boar sold for good prices in their last bred sow sale and that some of the best spring pigs ever on their farm are sired by him. Mr. Ross has joined with Mr. Bassett and Dr. J. A. Crawshaw in holding a bred sow sale October 7, and part of the sows he will consign are daughters of his former boar, Big Bob. All will be bred to Big Timm. It might also be mentioned that Big Timm is a half brother of Tolono Timm, one of the sires in the famous Poland-China herd of J. E. Meharry.

New Herd Boar

H. C. Shinn, formerly of Stratford, but now located near Tulare, has recently secured a new sire for his big type herd of Poland-Chinas. He comes from the herd of L. A. McClarnon, in Iowa, and is by Mc's Big Orange by Big Orange and out of Smooth Jumbo by Big Wonder Jumbo.

As he is by the same sire as Williams Bros.' famous boar, The Yankee, he has been named The Californian, and will be seen as a junior yearling at the fall shows.

Poland-China Sale.

Some of Kings County's Poland-China breeders are planning for a sale of 75 bred sows and a few out-standing bulls. The date chosen is October 7, 1919, at Kings County Fair Grounds, Hanford. Secretary Ross writes; This will be one of the best lots of Polands ever offered. The consigners are: M. and A. L. Bassett, J. A. Crawshaw and F. D. Ross.

Hereford Breeders to Sell in November

John A. Bunting, secretary of the Pacific Coast Hereford Breeders' Association, writes that at the recent meeting of the executive committee of that organization, held in San Francisco, it was decided that the association would sponsor a sale of 40 carefully selected Hereford bulls and females to be held at San Francisco in November during the week of the live stock show.

This will be the third sale held under the auspices of the association, and every effort is to be made to assemble an offering that will be superior to either of the former sales.

The sale will be conducted by the California Breeders' Sales and Pedigree Company, Sacramento, of which C. L. Hughes is manager.

Will Show and Sell Polands

Early in October Hale I. Marsh of Modesto, together with Les McCracken, Ripon, will offer at public sale about 50 head of bred sows and gilts. The sows and gilts from the Marsh herd will be daughters of Blue Valley Tecumseh, Model Major and I. B. A. Wonder and will be bred to Big Model, Major Hadley Wonder 2nd and Blue Valley Big Bone, while those from the McCracken herd will mostly be bred to the grand champion boar King's Big Bone Leader. Marsh says he will have his show herd at the state fair and also at San Francisco.

Lendorris Liberty Bond

W. L. Haag & Son, Hanford, write that their young boar, Lendorris Liberty Bond, by Liberty Bond, is making a rapid growth, weighing when just seven months old, 315 pounds. In their public sale to be held in Hanford, September 17, a number of sows and gilts bred to him will be offered, as well as those bred to their senior herd sire, Young Jumbo, by Jumbo Bob.

Lendorris Liberty Bond is regarded as one of the best young boars of the breed owned in California. He was sired by Liberty Bond, one of the popular Eastern boars, and the forthcoming sale will afford the first opportunity for California breeders to secure this blood.

A Combination Fall Poland Sale

W. D. Trewhitt, C. A. Vaughn and Geo. Nehls announce that they will hold a joint public sale of Poland-China bred sows and gilts. The sale will be held at Hanford, October 18.

The above breeders are among the leaders of the Hanford Poland colony and the offering they propose will be in keeping with the Kings County standard.

FROST VISITING CALIFORNIA BREEDERS

L. E. Frost of Chicago, editor and publisher of the Berkshire World, and one of the best known live stock men of this country, is now in California visiting the leading breeders. Frost says that he has never seen more rapid live stock development than has occurred in California since his last visit in February, 1918, and predicts that during the next ten years that California will come to take a high place among the great live stock states. Frost stated that California-bred Berkshires that have been sold to Eastern breeders have invariably made good and that many Eastern men are looking to this state to supply breeding stock to strengthen their herds.

While in California Frost plans to establish a number of Berkshire community units along the plans adopted by the Pure Bred Swine Extension Society and sanctioned by the leading swine record associations and the National Swine Growers' Association. The plan is an effort to establish

Secure Type with Production

On Rosamaines Ranch are being bred Holsteins TRUE to TYPE. Through our remarkable sires we are adding increased production. Ample proof of this is found in the records now being made on this ranch. Our stock are grown under healthy, sanitary conditions.

Junior Herd Sire

Rosamaines Pontiac Netherland

Sired by our senior herd sire King Pontiac Netherland Segis 3rd, a proven sire, three of his daughters making better than 21 pounds butter at the average age of two years, two months.

Why Experiment?

Experimenting with poor sires is **extremely expensive.** IT is no experiment when you secure your herd bull from **Rosamaines** Ranch. When you secure one of our young bulls you know just what you are getting—just what you can expect.

REMEMBER—You are not experimenting by securing your herd sire from

His Dam

Stanislaus Princess Cleopatra

By Prince Alviso Juliana and the dam of our junior herd sire. Her seven day record 525.8 pounds milk, 32,072 pounds butter, test 4.88 per cent. Her 30 day record, 1994.5 pounds milk, 124,442 pounds butter, test 4.99 per cent.

Rosamaines Ranch *Stalder Bros., Owners* **Riverside, Calif.**

swine production as a community project and the aim is to encourage the handling of one breed of hogs in a community. It is proposed that established breeders sell bred sows to beginners at a certain price and agree to buy back acceptable progeny to the amount paid for the sow. The basis for establishing values is a price per pound that represents a satisfactory margin over market quotations.

The seller also agrees to permit the buyers access to his herd boars, thus making it possible for the man with but few sows to breed them without the bother and expense of owning a boar. The society expects to maintain an office in Chicago and to establish a service department for the purpose of assisting the members of the local clubs on problems of feeding, management and selling.

Several units have been established in the Middle West and are said to be in successful operation.

TULARE COUNTY FOR DUROC-JERSEYS

Regarding the sale referred to below we may say that there was a serious error in the advertisement appearing on Page 841 of the last issue, giving the date as Wednesday, July 12. It should have been Wednesday, July 16.

Last January the Tulare County Duroc-Jersey breeders held their first public sale. At that time the number of breeders was limited and it was only by the sacrifice by a number of these men of animals that they really desired to retain in their herds that it was possible to hold the sale.

The results of the first sale were so satisfactory and, since a number of new herds have been started, it will be easier to secure the 60 animals listed in their forthcoming sale on July 16 than the 30 head comprising the first offering.

In arranging for this sale a committee was appointed whose duty was to visit the various herds and select only such animals as they considered of sufficient quality for a high class sale. Out of some 100 head 60 were found and these will make up the sale offering July 16.

It is believed that the animals listed in this sale have sufficient breeding and quality to attract buyers from all parts of the state and that both the breeder and farmer will find stock that will meet their approval.

It is the ambition to make Tulare County famous for Duroc-Jerseys and make it the Duroc-Jersey center of the state, and if good breeders, high class stock and a generous amount of publicity will accomplish it the hopes will be realized. Every Duroc-Jersey breeder and all those interested in the breed are invited to attend the sale, which will be held in the new sale pavilion. Col. George Bell is to be the auctioneer.

CALIFORNIA HAS GREAT FUTURE WITH HOGS

By E. C. Stone, Secretary American Hampshire Swine Record Association

I LEFT my home in Peoria, Illinois, on the 10th of April for the purpose of looking over the conditions of livestock in California, and to investigate the future prospects of the Hampshire breed of hogs in the Golden State.

I have traveled through every state in the Union in my work, except New Mexico and the New England states. I have been closely connected with the development of swine husbandry throughout all the Southern and Southeastern states, and these fields have been very fertile in supplying the world with fats.

In my travels through California the latter part of April, and up to the 20th of May, I had the pleasure of traveling about 4000 miles in the cars of Hampshire swine growers and growers of other breeds of hogs in California. While I have been connected with swine husbandry in a national way for the past number of years, I have never seen any state in all my travels more adapted to pork production than California. The natural conditions of California are very inviting, especially to the Hampshire breed as they are natural born foragers. It has been said by his owners that he is a hog able to go into fields and gather his feed, make his bed, grind his feed and after he has developed he is always able to carry his carcass to market.

I visited ranches ranging from 80 acres to 30,000 acres, and more, where very large numbers of hogs were feeding. The natural forage on these large ranches consists of natural grasses, burr clover and wild oats. To the two latter feeds may be added all the natural grasses native to the foothills, mountains and valleys where the ranches are located, but the most succulent of all these feeds during its period of growing is burr clover, next wild oats. Inasmuch as alfalfa grows so easily under California conditions, the Corn Belt hog grower would be inclined to call it a natural grass of California, but I rather like to call it a cultivated grass, and it is the greatest grass in California.

The future holds the richest prospects in swine husbandry for the California ranchman if he just wills to take hold now and enter into the hog business as a business, or as a developer for a ranch, regardless of the location of the ranch.

In my travels through the Sacramento Valley it looked like the garden spot of the United States for meat production, and since I have returned to the central West I have leaarned more about the possibilities of immediately building packing houses and furnishing a big market for all the pork that may be supplied from California ranches. Just as fast as these ranches develop in pork production, the packing houses will develop to take care of the product.

The future of swine husbandry in California is just what the individual ranch owner wants to make it, or the collective lot of owners will make it.

A meeting of all Hampshire breeders is being called at the public sale of Hampshire hogs on the Francis T. Underhill ranch at Santa Barbara, at 10 o'clock a. m., on August 6, for the purpose of organizing a California Hampshire Breeders 'Association. We wish to predict that this will be one of the big organizations of America and that the future will bear good fruits for all who engage in this particular class of swine husbandry.

The San Luis Obispo County Live Stock Association is planning for its annual farmers' picnic and live stock show at the Polytechnic school Friday and Saturday of this week. Friday is to be given over largely to stock judging, a concert by the Polytechnic band, tractor display, and the afternoon will be devoted by the young people to baseball and other games and contests. Saturday's principal features will be a barbecue at noon, exhibition of school work, live stock parade, and an auction sale of live stock, closing with graduation exercises. Secretary Warren C. Day writes that the association is expecting to have 10,000 people present at this event.

"Old Faithful"—A Real Comfort Shirt

"OLD FAITHFUL" is all that its name implies—built to serve every man. Cut generously throughout to permit great freedom of action—triple stitched on all strain seams — reinforced — two unusually large pockets with buttoned-down flaps, just where you can reach them easily. Go to your dealer today and order one or more of these good work shirts. You will find that they are of unequaled value—shirts that assure you unlimited comfort and splendid service.

"OLD FAITHFUL" is one of the family of

RELIANCE WORK SHIRTS

made famous by the senior member, the MILTON F. GOODMAN. "OLD FAITHFUL" comes in blue and grey chambray, black sateen and other standard fabrics—fits well and will outwear three ordinary shirts. Other familiar Reliance brands are "Black Beauty" — "Army" and "Honor Bright" for boys. The best dealers carry these good work shirts.

Don't Let Your Stock

Lose their early Summer Gain through neglect now

Pasture is getting short. Your animals must go on dry feed—hay and grain. It's a big change from the succulent, nutritious grasses of summer which supply the needed laxatives and tonics.

Keep your animals' bowels open and regular—drive out the worms—keep their blood rich—keep their digestive apparatus in order—by feeding Dr. Hess Stock Tonic.

A Conditioner and Worm Expeller

Don't allow your stock to "get off feed" and in a rundown condition. Dr. Hess Stock Tonic eliminates waste and gives appetite, good health and good digestion. It enables animals to get the most benefit out of their feed.

Buy Stock Tonic according to the size of your herd. *Here's a suggestion for your guidance:* Get from your dealer 2 pounds for each average hog, 5 pounds for each horse, cow or steer, to start with, feed as directed and then watch results.

Why Pay the Peddler Twice My Price?

You buy Dr. Hess Stock Tonic at an honest price from a responsible dealer in your own town who guarantees it, and who refunds your money if it does not do as claimed.

25-lb. Pail, $2.50 100-lb. Drum, $8.00

Shorthorn Sale Attracting Wide Interest

It is doubtful if any Western sale of beef cattle has attracted more attention than is being manifested over the sale of Shorthorns to be held at the state fair ground July 10 by W. M. Carruthers. That the interest is not confined to California alone is indicated by the fact that a number of national figures in Shorthorn affairs have signified their intention of attending the sale. Among those who are expected are John Tomson, president, W. A. Cochel, western representative, and Frank Brown, western fieldman, of the American Shorthorn Breeders' Association; Dean C. F. Curtis of the Iowa state agricultural college, and Edward Patterson, manager of the famous Ravenswood herd, the oldest herd of Shorthorns in existence. Col. Fred Reppert of Indiana and "Scotty" Milne of Missouri will serve as auctioneer and ring man. Milne is counted one of the leading authorities on Shorthorn pedigrees.

In keeping with the character of the event a rare collection of bulls and females has been catalogued. Aside from the well known bull, Hallwood Villager, two other bulls will be sold. One, a red junior yearling, was sired by Maxwalton, Rosedale, one of the good breeding sons of Avondale. His dam is a Victoria sired by a son of Scottish Signet. He is a highly pleasing type. The third bull is the four year old Majestic Viscount 2d by Wood Dale Stamp, a grandson of Choice Goods, used successfully by the veteran breeder N. H. Gentry. His dam is a Fancy of Ardmore, sired by Rosedale's Choice. He is a red, attractive fronted, very level and smooth with wonderful mellowness.

It is not possible to mention all the good females but a suggestion of the quality offered can be gained by reference to a few. The three year old Broadhook's Sultana 2d is a rare roan daughter of Augusta Baron and a Broadhooks dam sired by Whitehall Sultan. Not many granddaughters of Whitehall Sultan are offered for sale. She can be regarded as one of the valuable cows to sell this year. She sells with a heifer calf sired by Count Glory. The white Lady Ruberta, shown successfully at the state fair, was sired by Ruberta's Goods. Ruberta's Goods, it will be recalled, was one of the greatests grandsons of the famous Choice Goods and his dam was the noted Ruberta. The dam of Lady Ruberta was Lady Anne sired by Diamond Rex by Bapton Diamond whose dam was Bapton Pearl, the dam of Whitehall Sultan. She sells safe to the service of Count Glory.

Two particularly attractive red heifers are Mayfield Hurst 2nd and Mayfield Victoria 2d. Both are two year olds. The former was sired by Hallwood Sultan, a grandson of Whitehall Sultan, and out of a good Scotch cow. The latter is a daughter of Count Glory and is out of a Victoria dam. Red Queen 4th, selling with an April bull calf by Lavender Stamp 2d, is an especially desirable two year old daughter of Viscount's Stamp and from a Queen of Beauty dam. Ravenswood Lady 3d, a red senior yearling by Majestic Vicpunt and out of Lady Ardmore, is a half sister to Lady's Choice, the heifer that topped the Central Missouri breeders' sale and show and sold for $1550, and her full sistser sold a year later for $1250 and another sister was champion at the same show and topped the sale. She sells safe in calf to Lord Julian, the crack son of Lord Avondale.

Among the cows to sell are some of the best breeding matrons from the Carruthers herd. Lady Grace, a daughter of Ringmaster, sells with corking good bull calf, and Maggie Murphy, by the same sire, sells with a heifer calf.

Space does not permit more detailed mention, but enough has been written to indicate the character of the offering, practically all of which is of Scotch breeding and includes some of the most highly esteemed tribes. Forty-two females, including cows with calves at foot, and bred and unbred heifers and three bulls are listed. The sale is being managed by C. L. Hughes of the California Breeders' Sales and Pedigree Co.

Twenty Self-Feeder Rules

Prof. John Evaard has laid down the following rules for self-feeders:

1. An efficient method for full feeding of hogs is to self-feed.
2. If you wish to "grow your pigs along slowly," do not self-feed.
3. The hog does not like hash any better than you do.
4. The self-feeder will not save all of the work; only part of it.
5. Better have a little too much self-feeder trough space than too little.
6. The self-feeder works excellently with swine, but that is not saying that the same is true of horses, cattle, sheep, poultry and goats.
7. To self-feed pregnant sows mix bulky feeds with the grain, such as alfalfa. Regulate the grains by increasing or decreasing the hay meal.
8. The hog is a physiologist, not an economist; he eats to suit himself; and corn at three cents and corn at $3 looks all the same to him. In other words, "the hog looks out for himself, not you."
9. Human ingenuity must be exercised in learning what and which feed to place before swine in separate self-feeders to secure optimum results. In case of doubt use corn meal and meat meal tankage.
10. The hog can not always economically balance his ration; much depends upon the opportunities that you afford him. Choose the right feeds.
11. The self-feeder in the summer had best be in the shade, and in the winter away from the cold winds, preferably under warm shelter, well floored.
12. Rats, chickens, birds and other animals enjoy the self-feeder, as do the hogs; govern your operations accordingly.
13. The careless, unreliable human feeder can be displaced with the self-feeder to great advantage ofttimes in the full feeding of swine.
14. Self-watering is a part of the self-feeding system; therefore keep plenty of drinking water before the hogs always.
15. Self-fed pigs are liable to eat most any hour of the day or night, hence it is well to have the self-feeders easily accessible all of the time.
16. It is well not to "rush" the hog when he is eating; the self-feeder allows him plenty of time to eat without creating that impulse to hurry for fear that the other hogs get all of the feed (as in the hand-feeding scheme).
17. Do not neglect those pigs; give them a few self-feeders in which are corn, meat, tankage products, middlings and salt. Try the scheme, enjoy the results, and tell your neighbors.
18. There are scarcely any runts to cause downheartedness in the free-choice system fed bunches, because they get all they want to eat and of whatever feed; and it is the lack of suitable feed (and shelter) mostly that produces the "winter runts."
19. Lest we forget: The suckling pig that follows his "mammy" is self-fed all of the time; why not continue the practice after he is weaned?
20. Do not mix slop if you can do better. Save the time and the labor; use the self-feeder when full feeding.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Sore Lungs, Rheumatism and all Stiff Joints

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

REMOVES THE SORENESS—STRENGTHENS MUSCLES

KLAMATH COWS ON TEST

During the month of May 660 cows were tested by the Klamath River Cow Testing Association, and the report just issued shows that 71 cows made over 50 pounds butter fat during the month. All were grade Jerseys. The highest cow, owned by V. M. Del Ponte, produced 71.1 pounds fat. J. R. McMillan had the second highest cow with monthly production of 65.9 pounds. Eight other cows produced above 59 pounds. The owners and records follow:

J. W. Weber, 65.2 pounds; Paul Bravo, 65.1 pounds; C. P. McBeth, 62.6 pounds; Victor McFarlane, 62.5 pounds; P. F. Peine, 61.9 pounds; V. M. Del Ponte, 61.0 pounds and 60.0 pounds; J. R. McMillan, 59.7 pounds.

The above records were made on pasture only. E. C. Lockwood, secretary of the association, writing to Professor E. C. Voorhies, remarks: "This report is not a bad showing but we hope to have a better report for June. The result of weeding out boarder cows is beginning to show and members are becoming interested in securing better bulls. One registered Jersey bull was purchased this week."

MUST TEST CATTLE FOR TUBERCULOSIS

Animals in interstate commerce after July 1 must be shown free from disease. The enforcement of this new regulation will, it is believed, be of great assistance in preventing the further spread of tuberculosis among live stock, and having the work practically under state and federal supervision at all times will serve to bring about uniformity.

The department of agriculture, through its bureau of animal industry, is now actively cooperating with the state live stock sanitary officials and cattle owners of 42 states in the eradication of tuberculosis from live stock.

Recent legislation in several of the states has made it possible to proceed with the work where heretofore it has been impossible to do so. Federal funds available for the work are insufficient to meet present demands, and now that the cattle owners are finding the work to be of such advantage and importance the demands will increase rapidly.

Most activities are in the "accredited-herd" work with the owners and breeders of pure-bred herds of cattle who wish to free their herds from tuberculosis and have them placed on the list as "accredited."

HEMORRHAGIC SEPTICEMIA

Through the efforts of the farm adviser and the extension veterinarian of the United States bureau of animal industry, an outbreak of hemorrhagic septicemia in Tehama County has been successfully controlled. The outbreak occured in a herd of about 800 head and, though the losses had not been rapid, about 75 head had been lost before the farm adviser was called in .

At the request of the farm adviser, Dr. J. W. Logan of the United States bureau of animal industry was called in. He pronounced the case hemorrhagic septicemia and vaccination was recommended. This recommendation was carried out and the entire herd vaccinated at once with the mixed infection of bacterin. About 400 head received a second dose of bacterin in three days and five days after the second dose, 225 were given a third dose.

Improvement in the herd began to show almost immediately and between the first and second vaccinations there was a loss of only five pigs. Between the second and third doses only three were lost. This is in contrast to losses of four or five per day. There was also a very decided change in the general appearance of the herd, appetites picking up and the whole herd looking more thrifty.

DEL NORTE DAIRYMEN ORGANIZE

Professor E. C. Voorhies of the animal husbandry department of the University of California reports that the dairymen of Del Norte County have organized the Del Norte County Dairymen's Association. Rawley Scott is president and Clarence Westbrook of Smith River is secretary.

Prince Walker Cornucopia
The Highest Record Son of Prince Gelsche Walker

His dam: ALBA SADIE CORNUCOPIA CRESTA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:
At seven years—
Milk 338 days.....18,849.40
Butter 266.28
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85
She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

FARM LANDS FOR SALE

$35,000—61 acres located a short distance from Mountain View in a good location. There are 41 acres in alfalfa and 20 acres in tomatoes with a small family orchard. Improvements consist of a fine modern residence of 7 rooms, barn and a complete set of outbuildings. There is a first-class pumping plant on the property which furnishes an abundance of water for irrigation the year round. The place is fenced and cross fenced and divided off into several fields. Can be bought on terms.

$500 Per Acre—40 acres all in bearing alfalfa located in the rich Mountain View district, and divided into two fields, irrigation from pumping plant and artesian well. No buildings. Terms of payment can be arranged.

DAIRY AND ALFALFA LAND

$205 Per Acre, for 113 acres rich vegetable, dairy or alfalfa land; located near Mountain View, in a very good district; improvements consist of a 5-room ranch house, 3 barns, pumping plant and two flowing artesian wells. The property is fenced and cross fenced and divided off into six different fields; a remarkably cheap place; one-third cash required.

WILLIAM P. WRIGHT
Mountain View, Santa Clara Co., California.

Belgian hares, 15.

LIVE STOCK

Although the hog market in Chicago, Kansas City and Omaha has shown violent fluctuations throughout the month of June, prices have kept within a spread of $1.50 cwt. in comparison to the prices ruling June 2, which were $20.00 to $20.40. While the situation in the East has an indirect bearing on this market at most times, our market at present is in a much more settled condition. A gradual decline from the extreme top of $18.85, which price ruled a month ago, to the present quotations of $16.50 to $17.30 country shipping point or $18.00 to $18.50 f. o. b. here, has been devoid of sharp declines. The demand for hogs at present is light.

Beef cattle are very weak owing to the fact that the market is oversupplied with all classes and grades. Published quotations indicate a top for good steers at $10.50 f. o. b. Los Angeles, but cattle must be very good to command that figure. The bulk of buys center around $10.00 here for the average run.

Choice lambs are very scarce and a strong market rules. All other grades are weak as the supply of common lambs exceeds the fair demand.

In sympathy with lambs, ewes and wethers are also weak.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance from the city:

Cattle:
Good steers .....10.00@11.00
Medium steers .....9.50@10.00
Common steers .....8.00@9.00
Good cows .....8.00@8.50
Medium cows .....7.00@8.00
Common cows .....5.00@6.50
Hogs No. 1, 175-225 lbs. .....18.50@19.00
Hogs No. 2, all other weights..17.00@17.50
Sheep:
Lambs No. 1, 55 to 75 lbs.....15.00@16.00
Lambs No. 2, 65 to 80 lbs ....12.50@13.00
Wethers .....9.00@9.50
Ewes No. 1 .....8.00@9.00

The cost of getting common tea from the tea-plant to you is twice the tea-garden cost of the tea. Is it worth your while to pay this heavy cost and get poor weak tea-flavor and a lot of tannin?

Don't you see now why Schilling Tea costs less per cup than common tea? It costs no more to get it to you than common tea, and it has an abundance of fine tea-flavor.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

RUN UP OLD GIORY

Run up Old Glory!
Let it blaze
In red and white against the sky
And tell the story of the days
When hearts were stout and hopes were high.
Forget the daily fights of greed;
Forget the struggles, the dismay
Of facing cruelty and need—
Run up Old Glory for the day!

Run up Old Glory!
Think of all
The old flag means to you and me,
Of how the blast of freedom's call
Shook out its folds from sea to sea;
Red with the blood that it has cost,
White with the souls of them that died—
Today by laughing breezes tossed
It whispers of a nation's pride.

Run up Old Glory!
Fling it forth
And feel anew the country call
That thrills east, west and south and north
And has its word for one and all.
Run up Old Glory—fling it far
Across the blue of heaven's dome
And feel that every stripe and star
Is warder of your hearth and home.

—W. D. Nesbit.

THE REPUBLIC OF POLAND

Continued from last week.

Ninety years after this great victory that ended the dreams of the Turks, the powerful neighbors of Poland joined together to rob and plunder that republic. This was done under the inspiration of that great Robber King, Frederick the Great, and under his leadership. Poland was divided and nearly one-third of her territory was taken by the three robbers, Russia, Prussia and Austria. It was then that Prussia entered into a solemn covenant with Poland, that Poland should not be robbed again of her territory, and if any attempt was made in that direction, that Prussia would to the extent of her power, defend Poland. So 20 years afterward, when Russia was again making preparations to rob her, Poland appealed to Prussia to keep her promise. Prussia marched her army to the border of Poland and was received as a deliverer, but instead, the Prussians joined with the armies of Russia and Austria to again strip her of her territory. A more base act of treachery in the world's history was never recorded. Within two years, after a brave defense by Kosciusko, they completed the devilish work by wiping the republic of Poland from the map of the world and for 130 years those powers have ruled Poland without justice or mercy. Again and again the sons of Poland have attempted to regain their lost liberties only to fail against the overwhelming forces that she had to contend with.

Thousands of brave Poles have died in Siberia and perished in loathsome prisons. The most cruel and oppressive laws enacted by Prussia; in short all of the brutality that has characterized the Prussians, Austrians and Russians during the world war in France and Belgium and now in Russia, has been inflicted upon unfortunate Poland. But the earthquake came in 1914, when Austria and Prussia, aided by the Turks, were seeking to perpetrate upon the rest of the world what they had done in Poland, and the world was compelled to act.

The day of retribution has come and Russia, Prussia and Austria are in the dust. The monarchy of Russia has ceased to exist and her royal family was forced to go over the same road to exile in Siberia that so many of their victims had traveled, and at last to die the most brutal death that ever came to any royal family. And the whole empire is now covered with famine, blood and death. Germany, defeated in battle, her royal house in exile; her emperor with the punishment he has earned and will surely receive, awaiting him; the German empire covered with civil war and blood and devastation on every hand. Austria, the house of Hapsburg, is no more. The emperor in exile and the proud empire of Austria torn to tatters and what is left of it begging to be attached to what is left of Germany to save it from oblivion. So those three great and powerful empires dying, covered with shame and humiliation, while Poland, which they robbed and ruled for more than one hundred years, is again restored and is taking her place proudly among the free, independent and glorious republics.

But Poland has a great problem before her. Probably in the world's history never has a nation had a more difficult one. More than half of the country has been utterly devastated. More than 20,000 towns and villages have been burned. More than two-thirds of her man power has either been killed or disabled. Her wealth has been largely dissipated and practically all of her resources destroyed. With no source of revenue whatsoever, everything must be created and a standing army must be organized; for unless a League of Nations is formed to protect her, she will be subject to attacks by powerful nations.

Now the question is, has Poland creative genius among her men to bring this to pass? I believe she has, and that she will call into service men who will do all this and her problems will be solved. That which gives me most hope for Poland is the man whom she has called to be her first premier, Ignace Jan Paderewski. That election was so wise that it seems to me like inspiration. It is not too much to say that he is the best known Pole throughout the world. He is not only the most widely known and the most beloved, but his devoted patriotism was shown when the war broke out and he at once laid aside a profession that was bringing him nearly a half million a year, and devoted himself to Poland and her people.

Paderewski showed his organizing ability by raising the standard of Poland at once and appealing to his countrymen who were capable of bearing arms. He organized great armies, supplied them with every need and enthused them with his own indomitable spirit, without any compensation whatever—only to serve Poland. And they did this so gloriously that they fully sustained the illustrious past of Poland's armies. Paderewski is already showing himself to be a first class diplomat. When he went to Warsaw he found Poland almost on the brink of civil war, but he appealed to the patriotism of the people and quieted their factional fights. So I predict that in spite of all the handicaps, with such a leader as Paderewski, Poland's future will be even more glorious than was her past.

A WORD FOR INDEPENDENCE DAY

In addition to fearing God, it is necessary that we should be able and ready to take our own part. The man who cannot take his own part is a nuisance in the community, a source of weakness, an encouragement to wrongdoers and an added burden to the men who wish to do what is right.

If he cannot take his own part, then somebody else has to take it for him; and this means that his weakness and cowardice and inefficiency place an added burden on some other man, and make that man's strength by just so much of less avail to the community as a whole.

—Theodore Roosevelt.

THE FIRST CELEBRATION OF INDEPENDENCE DAY

July 4, 1776, was the day on which the Declaration of Independence was passed by the Continental Congress, and that date we celebrate as Independence Day. Last year the Fourth of July was celebrated not only in France, Italy and Belgium, but in England, as commemorating the emancipation of a self-respecting nation from the thoroughly Prussian tyranny of the German king of England, George III.

It was on July 8, 1776, that the Declaration was read to a large number of the inhabitants of Philadelphia and "was received with general applause and heartfelt satisfaction." In the evening the coat of arms of the late king was brought from the hall in the statehouse and burnt.

The Declaration was received by Washington at his headquarters in New York on July 9. Immediately the brigades were formed in hollow squares on their respective parades and the Declaration was read to them. One of these brigades was encamped on the "commons," where the New York city hall now stands. The hollow square was formed about the spot where the park fountain stands. Washington was within the square on horseback, and the Declaration was read in a clear voice by one of his aides. When it was concluded three hearty cheers were given. The same evening the equestrian statue of George III., which had been set up in 1770, was pulled down and, being mostly composed of lead, was subsequently made into bullets for the colonial army.

At Boston on the 18th there was a big military display, and the cannon roared from Fort Hill, Dorchester Neck, the Castle, Nantasket and Point Alderton, thirteen shots each, which were followed by the firing of salutes of thirteen rounds by each of the thirteen divisions into which the military had been divided.

The Declaration reached New Hampshire on July 18, and there were a military display, ringing of bells, firing of salutes and shouting at Portsmouth.

The celebration at Savannah, Georgia was elaborate. When the council received the Declaration on August 10 it gathered the people into the square before the assembly house and read it to them, after which the military fired salutes. Then both the military and the civil authorities paraded to the Liberty pole, where they were met by the Georgia battalion, which, after a second reading of the Declaration, discharged its fieldpieces and fired in platoons. After this it proceeded to the battery at the trustee's gardens, where the Declaration was read for the third and last time and the cannon of the battery discharged. This was followed by a dinner under the cedar trees, at which

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Kill All Flies! THEY SPREAD DISEASE

Placed anywhere, DAISY FLY KILLER attracts and kills all flies. Neat, clean, ornamental, convenient and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed.

DAISY FLY KILLER at your dealer or 5 by EXPRESS, prepaid, $1.25.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

the participants "cheerfully drank to the united, free and independent states of America."

SEASONABLE PRESERVING RECIPES

Strawberry Sunshine.

Use equal weights of berries and sugar, packing in alternate layers in large granite pan or kettle to four inches in depth. Place on stove, and let come slowly to boiling point. Skim. Boil 10 minutes. Pour into large platters two inches deep. Set in a sunny window, in an unused room for five days. Then scrape this thick "jelly" into glasses, cold, and seal. Best of all preserves.

Strawberry Jam.

For jam use about two cups sugar to a quart of berries; letting them set over night in the sugar and cook till syrup begins to thicken slightly; seal.

Spiced Crab Apples.

Six pounds apples chopped fine, two pounds raisins chopped fine, six pounds sugar, two oranges with peel, two teaspoons cassia, one-half tea spoon cloves, one pint vinegar. Heat vinegar, sugar and spices, add other ingredients. Boil slowly 25 minutes.

Plum Preserves.

The small red or yellow plums are on the market now and make a preserve of very good flavor, the color of the yellow plums being very clear and attractive.

Allow three-fourths pound of sugar for a pound of fruit, or if liked very sweet, one pound.

Pick the plums over, removing the stems, wash and weigh; pour one cup of cold water in the preserving kettle, add the plums, then the sugar; place over a very moderate fire and cook gently until the plums are soft and of a rich, dark color. Seal immediately.

Quince Preserves.

Pare and core, cut in quarters and wash after they are prepared. Weigh fruit and sugar, allowing one-half as much sugar as fruit. Use enamel pan, the larger the better. Fill pan about half full of boiling water, put in just enough fruit to swim; boil till they can be easily pierced with a fork. Then lift out on plates and put in more. Continue till all are boiled. Strain water they were boiled in. Put back over fire; when it boils again put in sugar and boil until clear. Then put in all the fruit and cook slowly about one hour, or till they are an even color through and through. Take up in stone jars or glass jars.

Conserve.

One quart rhubarb, not peeled, one pint red raspberries, one pint red currants, one pound raisins cut up, two oranges with peel cut up. To each pound of fruit add one pound sugar. Boil till thick like jelly. May add one pound of walnuts.

Rhubarb Preserve.

To one pint chopped, peeled pieplant add one pint sugar and juice of two large lemons. Cook slowly until very thick. Another way is to use one pint chopped pineapple and juice, instead of the lemons.

Cherry Preserve.

Cherries may be prepared as the strawberries were, but are easiest done as follows: Make a heavy syrup of one pint sugar to one-quarter pint water; boil till it is almost wax, then pour in one pint stoned cherries, and cook 10 minutes. Still another way is to use currant jelly, dropping the cherries in just as jelly is done, and boiling 10 minutes.

Strawberry Cordial.

In canning strawberries there is always some juice left and as I am a great believer in saving everything I can, I make a nice beverage of the juice. To one quart of juice add equal measure of sugar and three ounces of tartaric acid, stir well and when the sugar is dissolved strain, bottle, and cork tightly. Using one-half or two-thirds water and some broken ice you will find this a refreshing summer drink.

"VINEGAR BEES" HAVE LITTLE VALUE

Housewives can avoid being stung by "vinegar bees" or "beer bees" if they will keep in mind that the product advertised under these and other names is only a wild yeast of little value, say the specialists of the United States bureau of chemistry, Many inquiries recently received indicate that some enterprising individuals and firms are advertising this wild yeast under the names of "vinegar bees," "wine bees," "Australian bees," and various other designations. Extravagant claims are made for the product, and a fancy price out of all proportion to its original cost or actual worth is asked, say the yeast specialists of the department.

In some advertisements the sellers assert that the substance, when mixed with water and molasses or sugar, will produce vinegar, beer, or wine. Other promoters go as far as to say that the fermented mixture is beneficial in the treatment of rheumatism and kidney trouble—claims which have no foundation in fact.

The primitive process for making "bees" was to expose to the air a mixture of corn meal and molasses until it became impregnated with wild yeast and bacteria. The ferment so produced was employed locally in making a sort of vinegar or certain alcoholic solutions by adding it to a mixture of water and either brown sugar or molasses, which was then allowed to work or ferment.

In the opinion of the department specialists, a product made by catching yeast and bacteria indiscriminately from the air may contain harmful as well as desirable organisms, and the specialists state that great care should be exercised in both the preparation and the use of such a product. In their judgment "bees" is not as suited for fermentation as is the ordinary yeast cake which can be obtained from any grocer at much less than the fancy price asked for "vinegar bees," and they can not recommend "bees" at all for making vinegar.

SPONGING, PRESSING AND REMOVING SPOTS

Dark colored suits, when not badly soiled, can be sponged and pressed. To do this brush them well with a good stiff brush to remove all loose dust and dirt. Then sponge thoroughly till they are moistened, with a lukewarm mixture of one part of household ammonia to three parts of water; brush well with a good brush, hang up to dry, and finally press with a heavy iron, laying a cloth over the goods. Any grease spots not yielding to this process may be removed by using gasoline.

To sponge new cloth, take a heavy cotton cloth, wet it thoroughly and wring it out. Spread your goods on a table, folded into four thicknesses, and lay the damp cloth over it, ironing with a heavy iron until one side is done; repeat on the other side.

When removing a spot do not begin to work right on the spot, but start some distance away and gradually work toward it, using a good brush. In this way you will avoid leaving a ring.

Dark colored garments which have had the color entirely removed in spots by acids may be restored by an application of ammonia, and to those which have been spotted by alkalies, an application of diluted acetic acid is beneficial. A garment spotted by the rain may be freshened by laying the garment over an ironing board and steaming it. This is done by placing a damp cloth over the article and ironing.

To remove blood stains, or glue stains on woolen, cotton, linen or silk, wash with warm water to which one teaspoon of soda to each quart of water has been added.

To remove varnish or paint on wool, cotton or linen, rub carefully with gasoline and soap; on silk use gasoline.—Hazel Zimmerman, Home Demonstration Agent, Pima and Pinal Counties, Arizona.

Auto-Wheel

The ideal wagon for work or play

There's nothing more helpful or enjoyable on the farm than an

Auto-Wheel Coaster

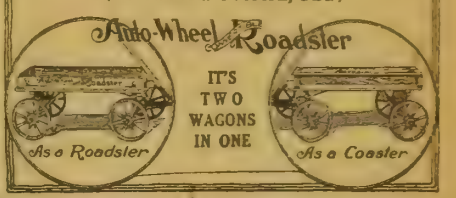
—: OR AN :—

Auto-Wheel Convertible Roadster

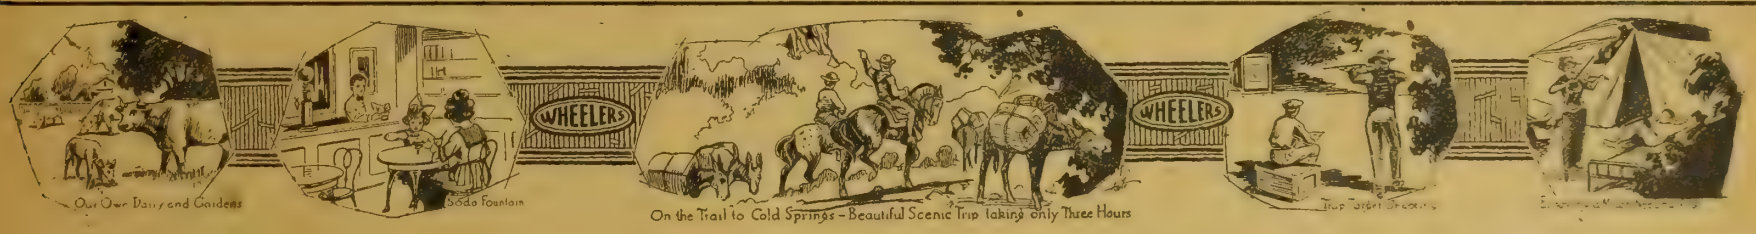
You can haul at one load enough stovewood to last mother a week. And you can haul big sacks of feed, bushel baskets of fruit, or vegetables—anything. And you need not be afraid of overloading the Auto-Wheel—it can carry as heavy loads as you can pull, and you can pull a mighty heavy load because the genuine roller bearings of the Auto-Wheel make it spin along with ease. The Auto-Wheel has genuine steel axles and tires, too.

We picture two types of Auto-Wheels. The Auto-Wheel Coaster at the top and the Convertible Roadster at the bottom. The Convertible Roadster has patented convertible sides. Turn up the sides when you want to coast or turn them down when you need a roadster for hauling. It's new and has made a hit with fellows everywhere.

Both Auto-Wheel Coaster and Auto-Wheel Convertible Roadster are noted for their speed as well as strength. They simply can't be beat in a race. Ask any fellow who owns an Auto-Wheel.



Want A Free Felt Pennant?



Write us the names of three coaster-wagon dealers, mentioning which handles the Auto-Wheel. We'll send you beautiful Auto-Wheel Booklet, too. Write today, sure.

MARKETS

Continued from Page 875

made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of June 21, Scott, Magner & Miller says:

Receipts of hay for the past week were 1686 tons, being about a 30 per cent increase over last week's arrivals. New crop hay is now coming in freely. Old hay maintains the prices formerly quoted but feels the effect of the new hay coming in and sales are slow. No fixed basis of prices can be quoted as yet for the new hay as purchasers are doubtful of its condition and afraid of buying hay that is not properly cured. Interior demand is very light by reason of temporary local supplies being available in most sections. The chief activity is in alfalfa which is being purchased at various points available to meal mills.

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay	
(light 5 wire bales)	19.00@21.00
No. 1 Wheat or Wheat and Oat Hay	16.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	17.00@19.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	11.00@14.00
Barley Hay	11.00@14.00
Alfalfa Hay	15.00@19.00
Stock Hay	11.00@13.00
New first cutting Alfalfa, in order	10.00@13.00
No. 1 Barley straw, bale	50@80

Citrus Markets

Los Angeles, June 25, 1919.

Imperial Valley cantaloupes and Eastern grown small fruits are filling the market and this has held back the demand for Valencias and price has materially suffered. There are something over 9000 cars yet to go forward, but as there are four months of Valencia season yet to come, it is presumed the market will recover.

The warm weather has given the lemon market a trend entirely contrary to that of oranges.

The demand is keen and prices entirely satisfactory.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: Oranges, 26,054 cars; lemons, 6978; total, 33,032. To same date last season: Oranges, 11,373; lemons 3773; total, 15,146. Central California this season: Oranges, 4410; lemons, 354; total, 4764. Last season to same date: Oranges, 2533; lemons, 115; total, 2648. Northern California: Oranges, 244; lemons, 2; last year same date, 203.

AT THE AUCTIONS

June 23

New York: 55 or., 5 lem. Val. 2.20-6.35, grapefruit 2.40, Sweets, 2.30-3.65.

Boston: 21 or., 5 lem. Val. 2.05-5.65, grapefruit 1.55-2.10, lem. 5.75-7.65.

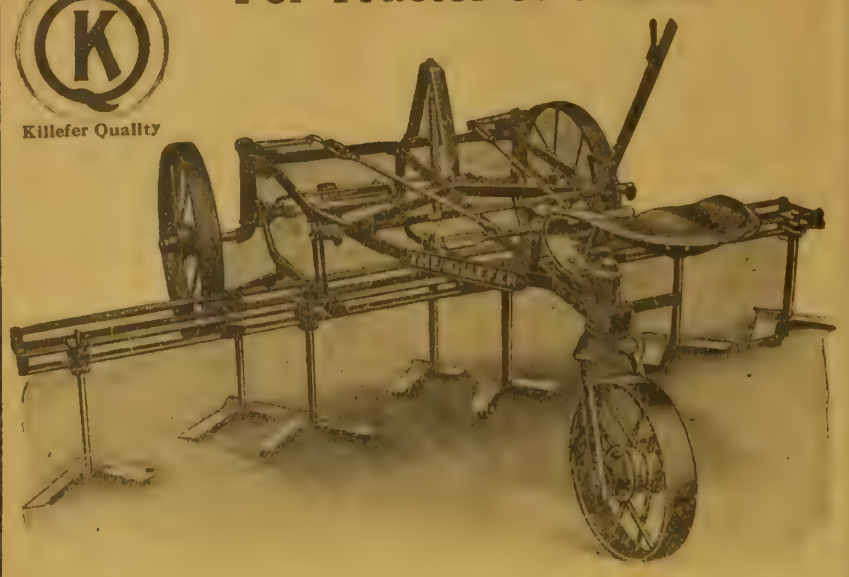
Cleveland: 7 or., 3 lem. Val. 2.95-4.95, lem. 3.50-6.90.

St. Louis: 4 or., 4 lem. Val. 2.25-4.55, lem. 5.40-7.30.

June 24

New York: No sale on account of strike.

Boston: 20 or., 2 lem. Val. 2.30-5.45, grapefruit 1.50-4.10, Mikes halves 2.25, lem. 6.40-7.75.



Philadelphia: 8 or., 4 lem. Val. 2.70-5.55, lem. 4.60-5.75.

Florida orange growers have suffered much inconvenience through scarcity of shook supplies.

Four Row Bean Cultivator

For Tractor or Teams

Killefer Quality

Conserve man power—One man cultivates four rows of beans as easily as two with this tool

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the lighter tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the four rows and the foot control is very easy on the driver. Built to cultivate any width row from 20 inches to 36 inches wide.

Write for Catalogue and book on deep tillage.

Just like getting a check

-30 cents of each dollar saved!

HASSLERS *for all* Ford Passenger Cars

HASSLER
TRADE MARK REGISTERED

Shock Absorber
PATENTED

The Hassler Guarantee: "Absolute satisfaction or your money back."

SUPPOSE your garageman gave you a check for 30 cents every time you spent a dollar for tires and repairs? Suppose he gave you a check each year for a third of the depreciation you know has taken place in your Ford Car or Ford One-Ton Truck? It amounts to exactly the same thing when you equip with Hassler Shock Absorbers. At least 30% of your tire and repair cost is saved outright, because the road shocks and vibrations are cushioned before they reach the vital and weighty parts of the machine. This elimination of vibration also reduces the depreciation loss in the same proportion. There is real economy—a real worth while saving! Of course, you know how much more satisfactory your car will ride if you have Hasslers on it. The added comfort alone is worth far more than they cost.

10 DAY TRIAL OFFER

Don't ride without Hasslers because someone tries to discourage you. They are a quality product—worth their price. The Hassler dealer in your vicinity will put them on for 10-days' trial. Your money refunded if you say so. Write for name of dealer and Trial Blank.

The Cultivator Costs Only $1.00 Per Year

LAND SETTLEMENT

Most Californians are gratified that the advanced position taken by this state in land settlement is affording a basis, or at least lending encouragement, for action by congress. There has been introduced in the house of representatives a bill by Mr. Mondell: "To provide employment and rural homes for those who have served the military and naval forces, through the reclamation of lands to be known as "National Soldier Setlement Act.' Here are some of the provisions of the bill:

The bill provides homes for farm workers. The California act introduced that idea in this country.

It provides that only landless men shall obtain homes. This is in the California act.

The payment periods on land, on improvements and on loans are the same as the California act.

The initial payments on land and improvements are copied from the California statute.

The provision requiring approval of sales or leases for the first ten years so as to protect the government from speculative filings and the settler from being tempted to sell out when offered a small profit are based on the California act, but are not so good.

One important provision permits the short time loans on live stock. We quote entire section eight:

"The secretary is also authorized to make short time loans from the fund, not to exceed $800 at any one time, to a soldier settler for the purchase of necessary live stock and equipment, and provision shall be made for the repayment of such loans during the period not to exceed five years with interest on deferred payments at four per cent per annum, payable annually, computed from date of contract: Provided, that no such loans shall exceed 60 per cent of the cost of the live stock and equipment purchased."

COCKROACHES

Some time ago we referred to the extermination of cockroaches by the feeding of plaster of Paris mixed with flour. When eaten by the roaches the moisture of the intestines was supposed to cause the plaster to set and the bug to turn to stone. Bronte A. Reynolds, editor of the Monthly Bulletin of the state commission of horticulture writes:

"After extensive experiments by the United States department of agriculture, this beautiful theory was pronounced to be absolutely fallacious for the reason that some unknown quality in the digestive apparatus of the said cockroaches prevents the plaster of Paris from setting."

Mr Reynolds also sends copy of Farmers Bulletin 658, "Cockroaches," written by C. L. Marlatt, entomologist and assistant chief of the bureau of markets of the U. S. D. A., at least he was at the time of writing the bulletin—he is now at the head of the national quarantine board. In this bulletin we find sodium fluoride is given credit for being the most effective and simple means of ridding premises of roaches. Commercial fluoride is used either pure or diluted one-half with some inert substance such as powdered gypsum or flour. Another poison recommended is powdered borax one part to three parts of finely pulverized chocolate. Pyrethrum, sold in California usually under the name of buhach, is one of the best repellants. When applied freely while fresh will paralyze or even kill the pest. Sulphur is another repellant when freely scattered.

THE HARVEST IS GREAT

Continued from Page 859

and acquaintance with the local press, can do more than anyone else to bring the matter before the farmer and urge action.

In Kings County the farm bureau has had a committee at work on the labor situation, which has resulted in the adoption of a

A scale adopted by a conference in Sacramento much earlier in the season by delegates from the counties of Merced, El Dorado, Sacramento, San Joaquin, Stanislaus, Solano, Yolo, Butte, Sutter and Placer resulted in:

GENERAL FARM WORK

A day of nine hours with board, per day, $2.25; including orchard and vineyard work, corn and bean harvest, irrigation of field crops, miscellaneous work.

GRAIN AND HAY HARVEST

A day of ten to twelve hours, as per local custom. Haying, including board, per day, $3; grain harvesting, including board, per day, $4 to $7.

FRUIT AND VEGETABLES

Per hour, without board, 30 to 40 cents; including picking, grading, cleaning and packing.

PIECE WORK

Picking: Cherries, per pound, two cents; plums, per 100 pounds, 25 cents; peaches and pears, per 100 pounds, 20 cents. Packing: Cherries, double faced, 15 cents; cherries, cartons, 18 cents; peaches, two and one-half cents; pears, with tender, six cents; without tender, including lidding, seven cents; plums and crate peaches, six cents; grapes, cleaned, six cents.

"The California Fruit Workers Association," an organization of workers recently formed in Watsonville, Santa Cruz County, according to the Pajaronian has issued the following manifesto:

We, the fruit workers of the State of California, are organizing for the betterment of ourselves and our worthy employers.

This is a free country and many of us have served in the great war just ended, and some of us have sacrificed life itself on the altar of our country.

We make this announcement through the county newspapers that our employers may be informed of our plans for the future to secure the proper reward for our honest labor and honest pay for the same. Our labor and the labor of all workers is for the profit of the employer. Without labor the employers' profit would come to a sudden stop. So we take this method of advertising our determination to enjoy the fruits of the golden opportunity of the present day ourselves, as well as our fellow friend, the employer.

This association receives as members ladies as well as men. All fruit workers, such as packing houses, canneries, dryer employes, orchard workers and apple haulers. Our monthly dues are 25 cents per month. Headquarters at No. 832 Walker street.

Care of the Small Flock

For the family which wishes to keep poultry for home consumption rather than for the market the so-called general purpose breeds are better suited than what are known as the egg laying breeds. Plymouth Rocks, Wyandottes, Rhode Island Reds and Orpingtons are all good varieties for the average person who does not intend to go into the poultry business on a considerable scale. These breeds are good layers and they also make good table poultry. Furthermore they will hatch their own eggs and brood their own chickens whereas the Leghorns and other breeds of the egg laying class do not sit, and the use of expensive incubators and brooders is necessary in order to perpetuate these flocks.

The prime essentials for a small poultry house are fresh air, dryness, sunlight and space enough to keep the birds comfortable. For the general purpose breeds about four square feet of floor space should be allowed for each bird. The fowls should also have as much outside space as possible to run in. If this area is too small the ground quickly becomes foul and in time makes it difficult to rear chickens with good success. In order to avoid foulness it is advisable to divide the lot and to sow part of it to the quick growing grains such as oats, wheat or rye. The hens are turned on to the growing grain when it is a few inches high. Under this method the yards may be changed every three or four weeks during the growing season. A combination that has proved successful consists of six or seven bushels of equal parts of oats and wheat to the acre, wheat alone being used for the last seeding in the fall. For the convenience of those who have only small areas at their disposal, it may be stated that an acre contains 43,560 square feet.

To secure a satisfactory number of eggs the fowls should be fed both a dry mash and a scratch ration. The dry mash may consist of equal parts of corn meal, bran, middlings and beef scrap. This should be kept before the birds in a hopper all the time. A good scratch ration is made up of equal parts of corn, wheat and oats, fed in a litter four to five inches deep, twice daily. It is desirable that the birds should eat about as much of this as of the mash. This means feeding about one quart of mixed grain daily to 12 Plymouth Rock hens or to 14 Leghorns, and an equal weight of mash. Usually waste table products will also be available, and these may be made up into a moist mash in place of the dry mash. In this case the table scrap, if it contains much meat, is substituted for the beef scrap. If it does not contain any considerable portion of meat it should merely be added to the dry mash already described.

The eighth Year Book of the Rhode Island White Club of America is just out. This is the 1919 Annual and is up to the usual standard of this live specialty club. The records of achievement of the Rhode Island Whites in the several egg laying contests have attracted much attention to this breed. The club is the active exponent of the breed and there are members in nearly every state and in Australia and Canada. H. E. Caldwell of Canutillo, Texas, is president and M. E. Bemis of Phoenix, Arizona, is secretary-treasurer. The Year Book contains the standard of the breed with illustrations, also the constitution and bylaws of the club as well as list of all members. The price of the book is 25 cents.

Book Review

Protective Poultry Husbandry

"Productive Poultry Husbandry," a complete text book dealing with the principles and practices involved in the management of poultry, by Harry R. Lewis, poultry husbandman, New Jersey agricultural experiment station, published by J. B. Lippincott Company, Philadelphia, at $2.00 net.

The exceedingly large and ever increasing demand for poultry and poultry products is causing the poultry business to become so profitable when conducted upon a scientific basis that no reader can afford to lack the latest knowledge of the best methods in all its branches.

The great need in poultry literature is for a work which covers the subject in a thoroughly scientific yet practical manner, giving the reader the results of research at the various experiment stations and the methods that are the most successful in present day practice. The author has made an earnest effort to help build the foundation for a systematic, scientific and greater poultry industry.

A number of pages and illustrations have been added to this third edition of what has become a standard text book for the farmer and the agricultural school and college. There is no phase of poultry keeping which the book does not fully meet. It brings the subject absolutely up-to-date. Choosing a poultry farm, equipment, feeding, breeding, anatomy, incubation and brooding, care of stock in all stages, marketing, exhibiting and judging, diseases and enemies, business management, and how to secure high egg production, are among the subjects handled clearly and authoritatively.

Every farmer and agricultural school should make use of this book, and it is invaluable for systematic reading courses adopted by granges and poultry associations.

COOPERATION IN POULTRY

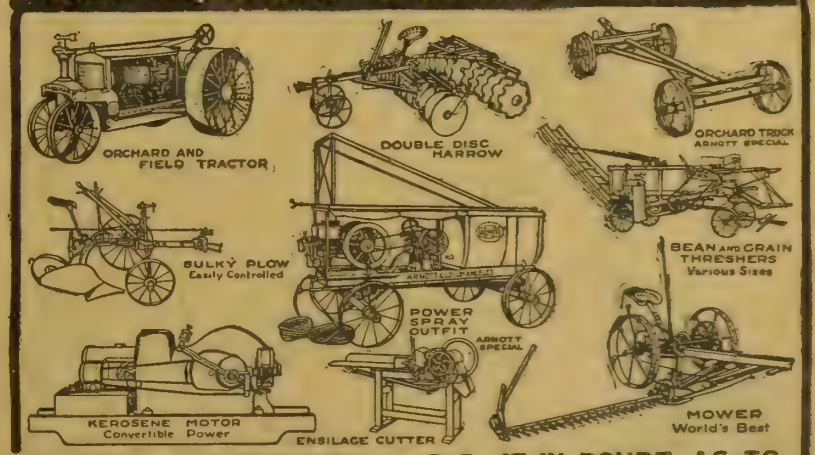
All records for business were broken by the Tulare Cooperative Poultry Association for the month ending June 10, the total receipts amounting to $31,489.55 as against $30,000 for the highest record for any other 30 days in the history of the association. The amount represented $16,000 for eggs, $3000 for poultry and $3500 for baby chicks. The feed and supply department did a business of $9000 for the period. The baby chick business was especially large, running over $100 per day and showing the great demand for more fowls in this district. Most of the deliveries were on orders placed at least a month ahead, the demand being so strong that all orders must be placed far in advance. Poultry association officials estimate that their organization handles one-third of the poultry and egg shipments from the city of Tulare.—F. A. G.

A new gin is being installed in Blythe, Palo Verde Valley.

A Wise Investment

EVERY time Biddy cackles you are three cents ahead. Invest that three cents in kerosene with which to operate a 1½-H. P. International kerosene engine and you have the power of twelve men under your direction for an hour—all for the price of an egg. To get useful power at a reasonable cost buy an

International Kerosene Engine



This sturdy, dependable engine will pay for itself over again during a year. Let it pump water, saw wood, run the sheller, washing machine, feed cutter, in fact do all the odd chores about the farm. Its shoulders are stronger and broader than yours and it does not get tired.

All three sizes of International kerosene engines, 1½, 3 and 6-H. P., operate successfully and economically on kerosene (coal oil) or gasoline. This means that the engine is properly designed, that the mixer, ignition system, oiling system, air and gas system are all made right.

See an International dealer. There is one located near you, or write the address below and get full information.

The uniform of THE UNIFORM FLOUR

The perfect loaf! It is one thing to *hope* for it. It is quite another thing to *know*, in advance, that you're going to get it!

And this is the assurance, the certainty, that comes with every sack of Sperry Drifted Snow Flour. This sack is the uniform of The Uniform Flour. It identifies the very best flour you can use in making bread.

And not because *we* say so—but because scientific tests by expert chemists, manufacturing tests by expert millers, practical tests by expert home-bakers—all combine to make Sperry Flour so uniform in high quality that you may be sure, in advance, of the best results from your baking and cooking.

Whether you buy a small sack or a large sack or a barrel of Sperry Flour—you can depend on its absolute uniformity. For the Sperry trademark on the Sperry sack is an assurance, a mark of super-quality, a protection *in every home.*

Ask for Sperry Drifted Snow Flour—at the store where you do your trading.

SPERRY FLOUR CO.
U. S. A.

Ten mills and forty-one distributing points on the Pacific Coast

(A12)

Here is the famous Sperry Standard Bread Recipe which has proven good in many practical kitchen tests by our home-baking experts. It will insure your getting a perfect loaf every time if you will only follow the directions carefully.

SPERRY WHITE BREAD

1 cup Boiling Water
1 tablespoonful Melted Shortening
1 tablespoonful Sugar
½ yeast cake dissolved in ¼ cup of lukewarm water
1 Teaspoonful Salt
Between 3 and 3½ cups Sperry Flour

All measurements should be level. Flour should be sifted before measuring.

METHOD OF PREPARATION

Put shortening, sugar and salt in boiling water; let stand until luke warm. Add dissolved yeast and Sperry Flour gradually, beating well until too stiff to stir. Then turn on moulding board and knead in remaining flour until mixture is smooth and elastic to touch, and bubbles may be seen under the surface. Return to well greased bowl, brush dough over with melted shortening, cover and allow to rise in a warm place to twice its original bulk, then cut down. This is accomplished by cutting through and turning over several times with a case knife. Let rise again, when the dough will be ready to shape into loaves or rolls. Place in well greased pans, having them about half full. Brush over loaves or rolls with melted shortening or milk, let rise again to double its bulk and bake in a hot oven about forty-five minutes for a medium sized loaf; twenty minutes for rolls.

This quantity is for one loaf of bread and with the amount of yeast given, to each cup of liquid, bread can be made and completed in about five hours. If a longer period be given to the rising process less yeast will be required. One-fourth cake to a cup of liquid may be used if bread is set over night. In either case the same method is used. Also the liquid can be half milk and half water or all milk if desired.
